# Chapter 1. Modules

Here is a list of all modules:

- ▶ [Error Handling](#)
- ▶ [General Information Query](#)
- ▶ [Compilation](#)

## 1.1. Error Handling

### enum nvvmResult

NVVM API call result code.

#### Values

```
NVVM_SUCCESS = 0  
NVVM_ERROR_OUT_OF_MEMORY = 1  
NVVM_ERROR_PROGRAM_CREATION_FAILURE = 2  
NVVM_ERROR_IR_VERSION_MISMATCH = 3  
NVVM_ERROR_INVALID_INPUT = 4  
NVVM_ERROR_INVALID_PROGRAM = 5  
NVVM_ERROR_INVALID_IR = 6  
NVVM_ERROR_INVALID_OPTION = 7  
NVVM_ERROR_NO_MODULE_IN_PROGRAM = 8  
NVVM_ERROR_COMPILATION = 9
```

### const char \*nvvmGetErrorString (nvvmResult result)

Get the message string for the given nvvmResult code.

#### Parameters

##### result

NVVM API result code.

## Returns

Message string for the given [nvvmResult](#) code.

## 1.2. General Information Query

**`nvvmResult nvvmIRVersion (int *majorIR, int *minorIR, int *majorDbg, int *minorDbg)`**

Get the NVVM IR version.

### Parameters

**majorIR**

NVVM IR major version number.

**minorIR**

NVVM IR minor version number.

**majorDbg**

NVVM IR debug metadata major version number.

**minorDbg**

NVVM IR debug metadata minor version number.

### Returns

- ▶ `NVVM_SUCCESS`

**`nvvmResult nvvmVersion (int *major, int *minor)`**

Get the NVVM version.

### Parameters

**major**

NVVM major version number.

**minor**

NVVM minor version number.

### Returns

- ▶ `NVVM_SUCCESS`

## 1.3. Compilation

```
typedef _nvmProgram *nvmProgram
```

NVVM Program.

An opaque handle for a program

```
nvmResult nvmAddModuleToProgram
(nvmProgram prog, const char *buffer, size_t size,
const char *name)
```

Add a module level NVVM IR to a program.

### Parameters

**prog**

NVVM program.

**buffer**

NVVM IR module in the bitcode or text representation.

**size**

Size of the NVVM IR module.

**name**

Name of the NVVM IR module. If NULL, "<unnamed>" is used as the name.

### Returns

- ▶ NVVM\_SUCCESS
- ▶ NVVM\_ERROR\_OUT\_OF\_MEMORY
- ▶ NVVM\_ERROR\_INVALID\_INPUT
- ▶ NVVM\_ERROR\_INVALID\_PROGRAM

### Description

The buffer should contain an NVVM IR module. The module should have NVVM IR version 1.6 either in the LLVM 7.0.1 bitcode representation or in the LLVM 7.0.1 text representation. Support for reading the text representation of NVVM IR is deprecated and may be removed in a later version.

## `nvvmResult nvvmCompileProgram (nvvmProgram prog, int numOptions, const char **options)`

Compile the NVVM program.

### Parameters

#### **prog**

NVVM program.

#### **numOptions**

Number of compiler options passed.

#### **options**

Compiler options in the form of C string array.

### Returns

- ▶ `NVVM_SUCCESS`
- ▶ `NVVM_ERROR_OUT_OF_MEMORY`
- ▶ `NVVM_ERROR_IR_VERSION_MISMATCH`
- ▶ `NVVM_ERROR_INVALID_PROGRAM`
- ▶ `NVVM_ERROR_INVALID_OPTION`
- ▶ `NVVM_ERROR_NO_MODULE_IN_PROGRAM`
- ▶ `NVVM_ERROR_COMPILATION`

### Description

The NVVM IR modules in the program will be linked at the IR level. The linked IR program is compiled to PTX.

The target datalayout in the linked IR program is used to determine the address size (32bit vs 64bit).

The valid compiler options are:

- ▶ `-g` (enable generation of debugging information, valid only with `-opt=0`)
- ▶ `-generate-line-info` (generate line number information)
- ▶ `-opt=`
  - ▶ `0` (disable optimizations)
  - ▶ `3` (default, enable optimizations)
- ▶ `-arch=`
  - ▶ `compute_35`
  - ▶ `compute_37`
  - ▶ `compute_50`

- ▶ compute\_52 (default)
- ▶ compute\_53
- ▶ compute\_60
- ▶ compute\_61
- ▶ compute\_62
- ▶ compute\_70
- ▶ compute\_72
- ▶ compute\_75
- ▶ compute\_80
- ▶ -ftz=
  - ▶ 0 (default, preserve denormal values, when performing single-precision floating-point operations)
  - ▶ 1 (flush denormal values to zero, when performing single-precision floating-point operations)
- ▶ -prec-sqrt=
  - ▶ 0 (use a faster approximation for single-precision floating-point square root)
  - ▶ 1 (default, use IEEE round-to-nearest mode for single-precision floating-point square root)
- ▶ -prec-div=
  - ▶ 0 (use a faster approximation for single-precision floating-point division and reciprocals)
  - ▶ 1 (default, use IEEE round-to-nearest mode for single-precision floating-point division and reciprocals)
- ▶ -fma=
  - ▶ 0 (disable FMA contraction)
  - ▶ 1 (default, enable FMA contraction)

## nvvmResult nvvmCreateProgram (nvvmProgram \*prog)

Create a program, and set the value of its handle to \*prog.

### Parameters

#### **prog**

NVVM program.

## Returns

- ▶ NVM\_SUCCESS
- ▶ NVM\_ERROR\_OUT\_OF\_MEMORY
- ▶ NVM\_ERROR\_INVALID\_PROGRAM

## Description

### See also:

[nvvmDestroyProgram\(\)](#)

## `nvvmResult nvvmDestroyProgram (nvvmProgram *prog)`

Destroy a program.

## Parameters

### **prog**

NVM program.

## Returns

- ▶ NVM\_SUCCESS
- ▶ NVM\_ERROR\_INVALID\_PROGRAM

## Description

### See also:

[nvvmCreateProgram\(\)](#)

## `nvvmResult nvvmGetCompiledResult (nvvmProgram prog, char *buffer)`

Get the compiled result.

## Parameters

### **prog**

NVM program.

### **buffer**

Compiled result.

## Returns

- ▶ NWM\_SUCCESS
- ▶ NWM\_ERROR\_INVALID\_PROGRAM

## Description

The result is stored in the memory pointed by 'buffer'.

## `nwmResult nwmGetCompiledResultSize (nwmProgram prog, size_t *bufferSizeRet)`

Get the size of the compiled result.

## Parameters

### **prog**

NWM program.

### **bufferSizeRet**

Size of the compiled result (including the trailing NULL).

## Returns

- ▶ NWM\_SUCCESS
- ▶ NWM\_ERROR\_INVALID\_PROGRAM

## `nwmResult nwmGetProgramLog (nwmProgram prog, char *buffer)`

Get the Compiler/Verifier Message.

## Parameters

### **prog**

NWM program program.

### **buffer**

Compilation/Verification log.

## Returns

- ▶ NWM\_SUCCESS
- ▶ NWM\_ERROR\_INVALID\_PROGRAM

## Description

The NULL terminated message string is stored in the memory pointed by 'buffer' when the return value is NVM\_SUCCESS.

## `nvmResult nvmGetProgramLogSize (nvmProgram prog, size_t *bufferSizeRet)`

Get the Size of Compiler/Verifier Message.

## Parameters

### **prog**

NVM program.

### **bufferSizeRet**

Size of the compilation/verification log (including the trailing NULL).

## Returns

- ▶ NVM\_SUCCESS
- ▶ NVM\_ERROR\_INVALID\_PROGRAM

## Description

The size of the message string (including the trailing NULL) is stored into 'buffer\_size\_ret' when the return value is NVM\_SUCCESS.

## `nvmResult nvmLazyAddModuleToProgram (nvmProgram prog, const char *buffer, size_t size, const char *name)`

Add a module level NVM IR to a program.

## Parameters

### **prog**

NVM program.

### **buffer**

NVM IR module in the bitcode representation.

### **size**

Size of the NVM IR module.

### **name**

Name of the NVM IR module. If NULL, "<unnamed>" is used as the name.

## Returns

- ▶ NVM\_SUCCESS
- ▶ NVM\_ERROR\_OUT\_OF\_MEMORY
- ▶ NVM\_ERROR\_INVALID\_INPUT
- ▶ NVM\_ERROR\_INVALID\_PROGRAM

## Description

The buffer should contain an NVM IR module. The module should have NVM IR version 1.6 in LLVM 7.0.1 bitcode representation.

A module added using this API is lazily loaded - the only symbols loaded are those that are required by module(s) loaded using `nvmAddModuleToProgram`. It is an error for a program to have all modules loaded using this API. Compiler may also optimize entities in this module by making them internal to the linked NVM IR module, making them eligible for other optimizations. Due to these optimizations, this API to load a module is more efficient and should be used where possible.

## `nvmResult nvmVerifyProgram (nvmProgram prog, int numOptions, const char **options)`

Verify the NVM program.

## Parameters

### **prog**

NVM program.

### **numOptions**

Number of compiler options passed.

### **options**

Compiler options in the form of C string array.

## Returns

- ▶ NVM\_SUCCESS
- ▶ NVM\_ERROR\_OUT\_OF\_MEMORY
- ▶ NVM\_ERROR\_IR\_VERSION\_MISMATCH
- ▶ NVM\_ERROR\_INVALID\_PROGRAM
- ▶ NVM\_ERROR\_INVALID\_IR
- ▶ NVM\_ERROR\_INVALID\_OPTION
- ▶ NVM\_ERROR\_NO\_MODULE\_IN\_PROGRAM

## Description

The valid compiler options are:

Same as for [nvmCompileProgram\(\)](#).

### See also:

[nvmCompileProgram\(\)](#)
