Chapter 1.
DIFFERENCE BETWEEN THE DRIVER AND RUNTIME APIS

The driver and runtime APIs are very similar and can for the most part be used interchangeably. However, there are some key differences worth noting between the two.

Complexity vs. control

The runtime API eases device code management by providing implicit initialization, context management, and module management. This leads to simpler code, but it also lacks the level of control that the driver API has.

In comparison, the driver API offers more fine-grained control, especially over contexts and module loading. Kernel launches are much more complex to implement, as the execution configuration and kernel parameters must be specified with explicit function calls. However, unlike the runtime, where all the kernels are automatically loaded during initialization and stay loaded for as long as the program runs, with the driver API it is possible to only keep the modules that are currently needed loaded, or even dynamically reload modules. The driver API is also language-independent as it only deals with cubin objects.

Context management

Context management can be done through the driver API, but is not exposed in the runtime API. Instead, the runtime API decides itself which context to use for a thread: if a context has been made current to the calling thread through the driver API, the runtime will use that, but if there is no such context, it uses a "primary context." Primary contexts are created as needed, one per device per process, are reference-counted, and are then destroyed when there are no more references to them. Within one process, all users of the runtime API will share the primary context, unless a context has been made current to each thread. The context that the runtime uses, i.e, either the current
context or primary context, can be synchronized with \texttt{cudaDeviceSynchronize()}, and destroyed with \texttt{cudaDeviceReset()}.

Using the runtime API with primary contexts has its tradeoffs, however. It can cause trouble for users writing plug-ins for larger software packages, for example, because if all plug-ins run in the same process, they will all share a context but will likely have no way to communicate with each other. So, if one of them calls \texttt{cudaDeviceReset()} after finishing all its CUDA work, the other plug-ins will fail because the context they were using was destroyed without their knowledge. To avoid this issue, CUDA clients can use the driver API to create and set the current context, and then use the runtime API to work with it. However, contexts may consume significant resources, such as device memory, extra host threads, and performance costs of context switching on the device. This runtime-driver context sharing is important when using the driver API in conjunction with libraries built on the runtime API, such as cuBLAS or cuFFT.
Chapter 2.
API SYNCHRONIZATION BEHAVIOR

The API provides memcpy/memset functions in both synchronous and asynchronous forms, the latter having an "Async" suffix. This is a misnomer as each function may exhibit synchronous or asynchronous behavior depending on the arguments passed to the function.

**Memcpy**

In the reference documentation, each memcpy function is categorized as synchronous or asynchronous, corresponding to the definitions below.

**Synchronous**

1. All transfers involving Unified Memory regions are fully synchronous with respect to the host.
2. For transfers from pageable host memory to device memory, a stream sync is performed before the copy is initiated. The function will return once the pageable buffer has been copied to the staging memory for DMA transfer to device memory, but the DMA to final destination may not have completed.
3. For transfers from pinned host memory to device memory, the function is synchronous with respect to the host.
4. For transfers from device to either pageable or pinned host memory, the function returns only once the copy has completed.
5. For transfers from device memory to device memory, no host-side synchronization is performed.
6. For transfers from any host memory to any host memory, the function is fully synchronous with respect to the host.

**Asynchronous**

1. For transfers from device memory to pageable host memory, the function will return only once the copy has completed.
2. For transfers from any host memory to any host memory, the function is fully synchronous with respect to the host.
3. For all other transfers, the function is fully asynchronous. If pageable memory must first be staged to pinned memory, this will be handled asynchronously with a worker thread.

**Memset**

The synchronous memset functions are asynchronous with respect to the host except when the target is pinned host memory or a Unified Memory region, in which case they are fully synchronous. The Async versions are always asynchronous with respect to the host.

**Kernel Launches**

Kernel launches are asynchronous with respect to the host. Details of concurrent kernel execution and data transfers can be found in the CUDA Programmers Guide.
Chapter 3.  
STREAM SYNCHRONIZATION BEHAVIOR

**Default stream**

The default stream, used when 0 is passed as a `cudaStream_t` or by APIs that operate on a stream implicitly, can be configured to have either legacy or per-thread synchronization behavior as described below.

The behavior can be controlled per compilation unit with the `--default-stream` nvcc option. Alternatively, per-thread behavior can be enabled by defining the `CUDA_API_PER_THREAD_DEFAULT_STREAM` macro before including any CUDA headers. Either way, the `CUDA_API_PER_THREAD_DEFAULT_STREAM` macro will be defined in compilation units using per-thread synchronization behavior.

**Legacy default stream**

The legacy default stream is an implicit stream which synchronizes with all other streams in the same `CUcontext` except for non-blocking streams, described below. (For applications using the runtime APIs only, there will be one context per device.) When an action is taken in the legacy stream such as a kernel launch or `cudaStreamWaitEvent()`, the legacy stream first waits on all blocking streams, the action is queued in the legacy stream, and then all blocking streams wait on the legacy stream.

For example, the following code launches a kernel `k_1` in stream `s`, then `k_2` in the legacy stream, then `k_3` in stream `s`:

```c
k_1<<<1, 1, 0, s>>>();
k_2<<<1, 1>>>();
k_3<<<1, 1, 0, s>>>();
```

The resulting behavior is that `k_2` will block on `k_1` and `k_3` will block on `k_2`.

Non-blocking streams which do not synchronize with the legacy stream can be created using the `cudaStreamNonBlocking` flag with the stream creation APIs.
The legacy default stream can be used explicitly with the `CUstream (cudaStream_t)` handle `CU_STREAM_LEGACY (cudaStreamLegacy)`.

**Per-thread default stream**

The per-thread default stream is an implicit stream local to both the thread and the `CUcontext`, and which does not synchronize with other streams (just like explicitly created streams). The per-thread default stream is not a non-blocking stream and will synchronize with the legacy default stream if both are used in a program.

The per-thread default stream can be used explicitly with the `CUstream (cudaStream_t)` handle `CU_STREAM_PER_THREAD (cudaStreamPerThread)`.
Graph objects (cudaGraph_t, CUgraph) are not internally synchronized and must not be accessed concurrently from multiple threads. API calls accessing the same graph object must be serialized externally.

Note that this includes APIs which may appear to be read-only, such as cudaGraphClone() (cuGraphClone()) and cudaGraphInstantiate() (cuGraphInstantiate()). No API or pair of APIs is guaranteed to be safe to call on the same graph object from two different threads without serialization.
Chapter 5. MODULES

Here is a list of all modules:

- Data types used by CUDA driver
- Error Handling
- Initialization
- Version Management
- Device Management
- Device Management [DEPRECATED]
- Primary Context Management
- Context Management
- Context Management [DEPRECATED]
- Module Management
- Memory Management
- Unified Addressing
- Stream Management
- Event Management
- External Resource Interoperability
- Stream memory operations
- Execution Control
- Execution Control [DEPRECATED]
- Graph Management
- Occupancy
- Texture Reference Management [DEPRECATED]
- Surface Reference Management [DEPRECATED]
- Texture Object Management
- Surface Object Management
- Peer Context Memory Access
- Graphics Interoperability

struct CUpcMemHandle
union CUpstreamBatchMemOpParams

defined CUaddress_mode

Texture reference addressing modes

Values

CU_TR_ADDRESS_MODE_WRAP = 0
  Wrapping address mode
CU_TR_ADDRESS_MODE_CLAMP = 1
  Clamp to edge address mode
CU_TR_ADDRESS_MODE_MIRROR = 2
  Mirror address mode
CU_TR_ADDRESS_MODE_BORDER = 3
  Border address mode

defined CUarray_cubemap_face

Array indices for cube faces

Values

CU_CUBEMAP_FACE_POSITIVE_X = 0x00
  Positive X face of cubemap
CU_CUBEMAP_FACE_NEGATIVE_X = 0x01
  Negative X face of cubemap
CU_CUBEMAP_FACE_POSITIVE_Y = 0x02
  Positive Y face of cubemap
CU_CUBEMAP_FACE_NEGATIVE_Y = 0x03
  Negative Y face of cubemap
CU_CUBEMAP_FACE_POSITIVE_Z = 0x04
  Positive Z face of cubemap
Positive Z face of cubemap

CU_CUBEMAP_FACE_NEGATIVE_Z = 0x05

Negative Z face of cubemap

**enum CUarray_format**

Array formats

**Values**

CU_AD_FORMAT_UNSIGNED_INT8 = 0x01
  Unsigned 8-bit integers
CU_AD_FORMAT_UNSIGNED_INT16 = 0x02
  Unsigned 16-bit integers
CU_AD_FORMAT_UNSIGNED_INT32 = 0x03
  Unsigned 32-bit integers
CU_AD_FORMAT_SIGNED_INT8 = 0x08
  Signed 8-bit integers
CU_AD_FORMAT_SIGNED_INT16 = 0x09
  Signed 16-bit integers
CU_AD_FORMAT_SIGNED_INT32 = 0x0a
  Signed 32-bit integers
CU_AD_FORMAT_HALF = 0x10
  16-bit floating point
CU_AD_FORMAT_FLOAT = 0x20
  32-bit floating point

**enum CUcomputemode**

Compute Modes

**Values**

CU_COMPUTEMODE_DEFAULT = 0
  Default compute mode (Multiple contexts allowed per device)
CU_COMPUTEMODE_PROHIBITED = 2
  Compute-prohibited mode (No contexts can be created on this device at this time)
CU_COMPUTEMODE_EXCLUSIVE_PROCESS = 3
  Compute-exclusive-process mode (Only one context used by a single process can be present on this device at a time)

**enum CUctx_flags**

Context creation flags
Values

CU_CTX_SCHED_AUTO = 0x00
Automatic scheduling
CU_CTX_SCHED_SPIN = 0x01
Set spin as default scheduling
CU_CTX_SCHED_YIELD = 0x02
Set yield as default scheduling
CU_CTX_SCHED_BLOCKING_SYNC = 0x04
Set blocking synchronization as default scheduling

CU_CTX_BLOCKING_SYNC = 0x04
Set blocking synchronization as default scheduling  Deprecated
This flag was deprecated as of CUDA 4.0 and was replaced with
CU_CTX_SCHED_BLOCKING_SYNC.
CU_CTX_SCHED_MASK = 0x07
CU_CTX_MAP_HOST = 0x08
Support mapped pinned allocations
CU_CTX_LMEM_RESIZE_TO_MAX = 0x10
Keep local memory allocation after launch
CU_CTX_FLAGS_MASK = 0x1f

enum CUdevice_attribute

Device properties

Values

CU_DEVICE_ATTRIBUTE_MAX_THREADS_PER_BLOCK = 1
Maximum number of threads per block
CU_DEVICE_ATTRIBUTE_MAX_BLOCK_DIM_X = 2
Maximum block dimension X
CU_DEVICE_ATTRIBUTE_MAX_BLOCK_DIM_Y = 3
Maximum block dimension Y
CU_DEVICE_ATTRIBUTE_MAX_BLOCK_DIM_Z = 4
Maximum block dimension Z
CU_DEVICE_ATTRIBUTE_MAX_GRID_DIM_X = 5
Maximum grid dimension X
CU_DEVICE_ATTRIBUTE_MAX_GRID_DIM_Y = 6
Maximum grid dimension Y
CU_DEVICE_ATTRIBUTE_MAX_GRID_DIM_Z = 7
Maximum grid dimension Z
CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_BLOCK = 8
Maximum shared memory available per block in bytes
CU_DEVICE_ATTRIBUTE_SHARED_MEMORY_PER_BLOCK = 8
Deprecated, use

`CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_BLOCK`

`CU_DEVICE_ATTRIBUTE_TOTAL_CONSTANT_MEMORY = 9`
Memory available on device for `__constant__` variables in a CUDA C kernel in bytes

`CU_DEVICE_ATTRIBUTE_WARP_SIZE = 10`
Warp size in threads

`CU_DEVICE_ATTRIBUTE_MAX_PITCH = 11`
Maximum pitch in bytes allowed by memory copies

`CU_DEVICE_ATTRIBUTE_MAX_REGISTERS_PER_BLOCK = 12`
Maximum number of 32-bit registers available per block

`CU_DEVICE_ATTRIBUTE_REGISTERS_PER_BLOCK = 12`
Deprecated, use `CU_DEVICE_ATTRIBUTE_MAX_REGISTERS_PER_BLOCK`

`CU_DEVICE_ATTRIBUTE_CLOCK_RATE = 13`
Typical clock frequency in kilohertz

`CU_DEVICE_ATTRIBUTE_TEXTURE_ALIGNMENT = 14`
Alignment requirement for textures

`CU_DEVICE_ATTRIBUTE_GPU_OVERLAP = 15`
Device can possibly copy memory and execute a kernel concurrently. Deprecated. Use instead `CU_DEVICE_ATTRIBUTE_ASYNC_ENGINE_COUNT`.

`CU_DEVICE_ATTRIBUTE_MULTIPROCESSOR_COUNT = 16`
Number of multiprocessors on device

`CU_DEVICE_ATTRIBUTE_KERNEL_EXEC_TIMEOUT = 17`
Specifies whether there is a run time limit on kernels

`CU_DEVICE_ATTRIBUTE_INTEGRATED = 18`
Device is integrated with host memory

`CU_DEVICE_ATTRIBUTE_CAN_MAP_HOST_MEMORY = 19`
Device can map host memory into CUDA address space

`CU_DEVICE_ATTRIBUTE_COMPUTE_MODE = 20`
Compute mode (See `CUcomputemode` for details)

`CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_WIDTH = 21`
Maximum 1D texture width

`CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_WIDTH = 22`
Maximum 2D texture width

`CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_HEIGHT = 23`
Maximum 2D texture height

`CU DEVICE ATTRIBUTE_MAXIMUM_TEXTURE3D_WIDTH = 24`
Maximum 3D texture width

`CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_HEIGHT = 25`
Maximum 3D texture height

`CU DEVICE ATTRIBUTE_MAXIMUM_TEXTURE3D_DEPTH = 26`
Maximum 3D texture depth

`CU DEVICE ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_WIDTH = 27`
Maximum 2D layered texture width
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_HEIGHT = 28
Maximum 2D layered texture height
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_LAYERS = 29
Maximum layers in a 2D layered texture
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_ARRAY_WIDTH = 27
    Deprecated, use
    CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_WIDTH
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_ARRAY_HEIGHT = 28
    Deprecated, use
    CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_HEIGHT
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_ARRAY_NUMSLICES = 29
    Deprecated, use
    CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_LAYERS
CU_DEVICE_ATTRIBUTE_SURFACE_ALIGNMENT = 30
    Alignment requirement for surfaces
CU_DEVICE_ATTRIBUTE_CONCURRENT_KERNELS = 31
    Device can possibly execute multiple kernels concurrently
CU_DEVICE_ATTRIBUTE_ECC_ENABLED = 32
    Device has ECC support enabled
CU_DEVICE_ATTRIBUTE_PCI_BUS_ID = 33
    PCI bus ID of the device
CU_DEVICE_ATTRIBUTE_PCI_DEVICE_ID = 34
    PCI device ID of the device
CU_DEVICE_ATTRIBUTE_TCC_DRIVER = 35
    Device is using TCC driver model
CU_DEVICE_ATTRIBUTE_MEMORY_CLOCK_RATE = 36
    Peak memory clock frequency in kilohertz
CU_DEVICE_ATTRIBUTE_GLOBAL_MEMORY_BUS_WIDTH = 37
    Global memory bus width in bits
CU_DEVICE_ATTRIBUTE_L2_CACHE_SIZE = 38
    Size of L2 cache in bytes
CU_DEVICE_ATTRIBUTE_MAX_THREADS_PER_MULTIPROCESSOR = 39
    Maximum resident threads per multiprocessor
CU_DEVICE_ATTRIBUTE_ASYNC_ENGINE_COUNT = 40
    Number of asynchronous engines
CU_DEVICE_ATTRIBUTE_UNIFIED_ADDRESSING = 41
    Device shares a unified address space with the host
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LAYERED_WIDTH = 42
    Maximum 1D layered texture width
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LAYERED_LAYERS = 43
    Maximum layers in a 1D layered texture
CU_DEVICE_ATTRIBUTE_CAN_TEX2D_GATHER = 44
    Deprecated, do not use.
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_GATHER_WIDTH = 45
Maximum 2D texture width if CUDA_ARRAY3D_TEXTURE_GATHER is set

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_GATHER_HEIGHT = 46
Maximum 2D texture height if CUDA_ARRAY3D_TEXTURE_GATHER is set

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_WIDTH_ALTERNATE = 47
Alternate maximum 3D texture width

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_HEIGHT_ALTERNATE = 48
Alternate maximum 3D texture height

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_DEPTH_ALTERNATE = 49
Alternate maximum 3D texture depth

CU_DEVICE_ATTRIBUTE_PCI_DOMAIN_ID = 50
PCI domain ID of the device

CU_DEVICE_ATTRIBUTE_TEXTURE_PITCH_ALIGNMENT = 51
Pitch alignment requirement for textures

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURECUBEMAP_WIDTH = 52
Maximum cubemap texture width/height

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURECUBEMAP_LAYERED_WIDTH = 53
Maximum cubemap layered texture width/height

CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURECUBEMAP_LAYERED_LAYERS = 54
Maximum layers in a cubemap layered texture

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE1D_WIDTH = 55
Maximum 1D surface width

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_WIDTH = 56
Maximum 2D surface width

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_HEIGHT = 57
Maximum 2D surface height

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE3D_WIDTH = 58
Maximum 3D surface width

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE3D_HEIGHT = 59
Maximum 3D surface height

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE3D_DEPTH = 60
Maximum 3D surface depth

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE1D_LAYERED_WIDTH = 61
Maximum 1D layered surface width

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE1D_LAYERED_LAYERS = 62
Maximum layers in a 1D layered surface

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_LAYERED_WIDTH = 63
Maximum 2D layered surface width

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_LAYERED_HEIGHT = 64
Maximum 2D layered surface height

CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_LAYERED_LAYERS = 65

Maximum layers in a 2D layered surface

**CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_WIDTH** = 66
Maximum cubemap surface width

**CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_LAYERED_WIDTH** = 67
Maximum cubemap layered surface width

**CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_LAYERED_LAYERS** = 68
Maximum layers in a cubemap layered surface

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LINEAR_WIDTH** = 69
Maximum 1D linear texture width

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_WIDTH** = 70
Maximum 2D linear texture width

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_HEIGHT** = 71
Maximum 2D linear texture height

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_PITCH** = 72
Maximum 2D linear texture pitch in bytes

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_MIPMAPPED_WIDTH** = 73
Maximum mipmapped 2D texture width

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_MIPMAPPED_HEIGHT** = 74
Maximum mipmapped 2D texture height

**CU_DEVICE_ATTRIBUTE_COMPUTE_CAPABILITY_MAJOR** = 75
Major compute capability version number

**CU_DEVICE_ATTRIBUTE_COMPUTE_CAPABILITY_MINOR** = 76
Minor compute capability version number

**CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_MIPMAPPED_WIDTH** = 77
Maximum mipmapped 1D texture width

**CU_DEVICE_ATTRIBUTE_STREAM_PRIORITIES_SUPPORTED** = 78
Device supports stream priorities

**CU_DEVICE_ATTRIBUTE_GLOBAL_L1_CACHE_SUPPORTED** = 79
Device supports caching globals in L1

**CU_DEVICE_ATTRIBUTE_LOCAL_L1_CACHE_SUPPORTED** = 80
Device supports caching locals in L1

**CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_MULTIPROCESSOR** = 81
Maximum shared memory available per multiprocessor in bytes

**CU_DEVICE_ATTRIBUTE_MAX_REGISTERS_PER_MULTIPROCESSOR** = 82
Maximum number of 32-bit registers available per multiprocessor

**CU_DEVICE_ATTRIBUTE_MANAGED_MEMORY** = 83
Device can allocate managed memory on this system

**CU_DEVICE_ATTRIBUTE_MULTI_GPU_BOARD** = 84
Device is on a multi-GPU board

**CU_DEVICE_ATTRIBUTE_MULTI_GPU_BOARD_GROUP_ID** = 85
Unique id for a group of devices on the same multi-GPU board

CU_DEVICE_ATTRIBUTE_HOST_NATIVE_ATOMIC_SUPPORTED = 86
Link between the device and the host supports native atomic operations (this is a placeholder attribute, and is not supported on any current hardware)

CU_DEVICE_ATTRIBUTE_SINGLE_TO_DOUBLE_PRECISION_PERF_RATIO = 87
Ratio of single precision performance (in floating-point operations per second) to double precision performance

CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS = 88
Device supports coherently accessing pageable memory without calling cudaHostRegister on it

CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS = 89
Device can coherently access managed memory concurrently with the CPU

CU_DEVICE_ATTRIBUTE_COMPUTE_PREEMPTION_SUPPORTED = 90
Device supports compute preemption.

CU_DEVICE_ATTRIBUTE_CAN_USE_HOST_POINTER_FOR_REGISTERED_MEM = 91
Device can access host registered memory at the same virtual address as the CPU

CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_MEM_OPS = 92
cuStreamBatchMemOp and related APIs are supported.

CU_DEVICE_ATTRIBUTE_CAN_USE_64_BIT_STREAM_MEM_OPS = 93
64-bit operations are supported in cuStreamBatchMemOp and related APIs.

CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_WAIT_VALUE_NOR = 94
CU_STREAM_WAIT_VALUE_NOR is supported.

CU_DEVICE_ATTRIBUTE_COOPERATIVE_LAUNCH = 95
Device supports launching cooperative kernels via cuLaunchCooperativeKernel

CU_DEVICE_ATTRIBUTE_COOPERATIVE_MULTI_DEVICE_LAUNCH = 96
Device can participate in cooperative kernels launched via cuLaunchCooperativeKernelMultiDevice

CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_BLOCK_OPTIN = 97
Maximum optin shared memory per block

CU_DEVICE_ATTRIBUTE_CAN_FLUSH_REMOTE_WRITES = 98
Both the CU_STREAM_WAIT_VALUE_FLUSH flag and the CU_STREAM_MEM_OP_FLUSH_REMOTE_WRITES MemOp are supported on the device. See Stream memory operations for additional details.

CU_DEVICE_ATTRIBUTE_HOST_REGISTER_SUPPORTED = 99
Device supports host memory registration via cudaHostRegister.

CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS_USES_HOST_PAGE_TABLES = 100
Device accesses pageable memory via the host’s page tables.

CU_DEVICE_ATTRIBUTE_DIRECT_MANAGED_MEM_ACCESS_FROM_HOST = 101
The host can directly access managed memory on the device without migration.

CU_DEVICE_ATTRIBUTE_MAX
enum CUdevice_P2PAttribute

P2P Attributes

Values

CU_DEVICE_P2P_ATTRIBUTE_PERFORMANCE_RANK = 0x01
   A relative value indicating the performance of the link between two devices

CU_DEVICE_P2P_ATTRIBUTE_ACCESS_SUPPORTED = 0x02
   P2P Access is enable

CU_DEVICE_P2P_ATTRIBUTE_NATIVE_ATOMIC_SUPPORTED = 0x03
   Atomic operation over the link supported

CU_DEVICE_P2P_ATTRIBUTE_ACCESS_ACCESS_SUPPORTED = 0x04
   Deprecated use
   CU_DEVICE_P2P_ATTRIBUTE_CUDA_ARRAY_ACCESS_SUPPORTED instead

CU_DEVICE_P2P_ATTRIBUTE_CUDA_ARRAY_ACCESS_SUPPORTED = 0x04
   Accessing CUDA arrays over the link supported

enum CUeglColorFormat

CUDA EGL Color Format - The different planar and multiplanar formats currently supported for CUDA_EGL interops.

Values

CU_EGL_COLOR_FORMAT_YUV420_PLANAR = 0x00
   Y, U, V in three surfaces, each in a separate surface, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

CU_EGL_COLOR_FORMAT_YUV420_SEMIPLANAR = 0x01
   Y, UV in two surfaces (UV as one surface) with VU byte ordering, width, height ratio same as YUV420Planar.

CU_EGL_COLOR_FORMAT_YUV422_PLANAR = 0x02
   Y, U, V each in a separate surface, U/V width = 1/2 Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YUV422_SEMIPLANAR = 0x03
   Y, UV in two surfaces with VU byte ordering, width, height ratio same as YUV422Planar.

CU_EGL_COLOR_FORMAT_RGB = 0x04
   R/G/B three channels in one surface with BGR byte ordering. Only pitch linear format supported.

CU_EGL_COLOR_FORMAT_BGR = 0x05
   R/G/B three channels in one surface with RGB byte ordering. Only pitch linear format supported.

CU_EGL_COLOR_FORMAT_ARGB = 0x06
   R/G/B/A four channels in one surface with BGRA byte ordering.
CU_EGL_COLOR_FORMAT_RGBA = 0x07
R/G/B/A four channels in one surface with ABGR byte ordering.

CU_EGL_COLOR_FORMAT_L = 0x08
single luminance channel in one surface.

CU_EGL_COLOR_FORMAT_R = 0x09
single color channel in one surface.

CU_EGL_COLOR_FORMAT_YUV444_PLANAR = 0x0A
Y, U, V in three surfaces, each in a separate surface, U/V width = Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YUV444_SEMIPLANAR = 0x0B
Y, UV in two surfaces (UV as one surface) with VU byte ordering, width, height ratio same as YUV444Planar.

CU_EGL_COLOR_FORMAT_YUYV_422 = 0x0C
Y, U, V in one surface, interleaved as UYVY.

CU_EGL_COLOR_FORMAT_UYVY_422 = 0x0D
Y, U, V in one surface, interleaved as YUYV.

CU_EGL_COLOR_FORMAT_ABGR = 0x0E
R/G/B/A four channels in one surface with RGBA byte ordering.

CU_EGL_COLOR_FORMAT_BGRA = 0x0F
R/G/B/A four channels in one surface with ARGB byte ordering.

CU_EGL_COLOR_FORMAT_A = 0x10
Alpha color format - one channel in one surface.

CU_EGL_COLOR_FORMAT_RG = 0x11
R/G color format - two channels in one surface with GR byte ordering.

CU_EGL_COLOR_FORMAT_AYUV = 0x12
Y, U, V, A four channels in one surface, interleaved as VUYA.

CU_EGL_COLOR_FORMAT_YVU444_SEMIPLANAR = 0x13
Y, VU in two surfaces (VU as one surface) with UV byte ordering, U/V width = Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YVU422_SEMIPLANAR = 0x14
Y, VU in two surfaces (VU as one surface) with UV byte ordering, U/V width = 1/2 Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YVU420_SEMIPLANAR = 0x15
Y, VU in two surfaces (VU as one surface) with UV byte ordering, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

CU_EGL_COLOR_FORMAT_Y10V10U10_444_SEMIPLANAR = 0x16
Y10, V10U10 in two surfaces (VU as one surface) with UV byte ordering, U/V width = Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_Y10V10U10_420_SEMIPLANAR = 0x17
Y10, V10U10 in two surfaces (VU as one surface) with UV byte ordering, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

CU_EGL_COLOR_FORMAT_Y12V12U12_444_SEMIPLANAR = 0x18
Y12, V12U12 in two surfaces (VU as one surface) with UV byte ordering, U/V width = Y width, U/V height = Y height.

**CU_EGL_COLOR_FORMAT_Y12V12U12_420_SEMIPLANAR = 0x19**
Y12, V12U12 in two surfaces (VU as one surface) with UV byte ordering, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

**CU_EGL_COLOR_FORMAT_VYUY_ER = 0x1A**
Extended Range Y, U, V in one surface, interleaved as YVYU.

**CU_EGL_COLOR_FORMAT_UYVY_ER = 0x1B**
Extended Range Y, U, V in one surface, interleaved as YUYV.

**CU_EGL_COLOR_FORMAT_YUYV_ER = 0x1C**
Extended Range Y, U, V in one surface, interleaved as UYVY.

**CU_EGL_COLOR_FORMAT_VYUYU_ER = 0x1D**
Extended Range Y, U, V in one surface, interleaved as VYUY.

**CU_EGL_COLOR_FORMAT_YUV_ER = 0x1E**
Extended Range Y, U, V three channels in one surface, interleaved as VUY. Only pitch linear format supported.

**CU_EGL_COLOR_FORMAT_YUYVA_ER = 0x1F**
Extended Range Y, U, V, A four channels in one surface, interleaved as AVUY.

**CU_EGL_COLOR_FORMAT_AYUV_ER = 0x20**
Extended Range Y, U, V, A four channels in one surface, interleaved as VUYA.

**CU_EGL_COLOR_FORMAT_YUV444_PLANAR_ER = 0x21**
Extended Range Y, U, V in three surfaces, U/V width = Y width, U/V height = Y height.

**CU_EGL_COLOR_FORMAT_YUV422_PLANAR_ER = 0x22**
Extended Range Y, U, V in three surfaces, U/V width = 1/2 Y width, U/V height = Y height.

**CU_EGL_COLOR_FORMAT_YUV420_PLANAR_ER = 0x23**
Extended Range Y, U, V in three surfaces, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

**CU_EGL_COLOR_FORMAT_YUV444_SEMIPLANAR_ER = 0x24**
Extended Range Y, UV in two surfaces (UV as one surface) with VU byte ordering, U/V width = Y width, U/V height = Y height.

**CU_EGL_COLOR_FORMAT_YUV422_SEMIPLANAR_ER = 0x25**
Extended Range Y, UV in two surfaces (UV as one surface) with VU byte ordering, U/V width = 1/2 Y width, U/V height = Y height.

**CU_EGL_COLOR_FORMAT_YUV420_SEMIPLANAR_ER = 0x26**
Extended Range Y, UV in two surfaces (UV as one surface) with VU byte ordering, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

**CU_EGL_COLOR_FORMAT_YVU444_PLANAR_ER = 0x27**
Extended Range Y, V, U in three surfaces, U/V width = Y width, U/V height = Y height.

**CU_EGL_COLOR_FORMAT_YVU422_PLANAR_ER = 0x28**
Extended Range Y, V, U in three surfaces, U/V width = 1/2 Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YVU420_PLANAR_ER = 0x29
Extended Range Y, V, U in three surfaces, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

CU_EGL_COLOR_FORMAT_YVU444_SEMIPLANAR_ER = 0x2A
Extended Range Y, VU in two surfaces (VU as one surface) with UV byte ordering, U/V width = Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YVU422_SEMIPLANAR_ER = 0x2B
Extended Range Y, VU in two surfaces (VU as one surface) with UV byte ordering, U/V width = 1/2 Y width, U/V height = Y height.

CU_EGL_COLOR_FORMAT_YVU420_SEMIPLANAR_ER = 0x2C
Extended Range Y, VU in two surfaces (VU as one surface) with UV byte ordering, U/V width = 1/2 Y width, U/V height = 1/2 Y height.

CU_EGL_COLOR_FORMAT_BAYER_RGGB = 0x2D
Bayer format - one channel in one surface with interleaved RGGB ordering.

CU_EGL_COLOR_FORMAT_BAYER_BGGR = 0x2E
Bayer format - one channel in one surface with interleaved BGGR ordering.

CU_EGL_COLOR_FORMAT_BAYER_GRBG = 0x2F
Bayer format - one channel in one surface with interleaved GRBG ordering.

CU_EGL_COLOR_FORMAT_BAYER_GBRG = 0x30
Bayer format - one channel in one surface with interleaved GBRG ordering.

CU_EGL_COLOR_FORMAT_BAYER10_RGGB = 0x31
Bayer10 format - one channel in one surface with interleaved RGGB ordering. Out of 16 bits, 10 bits used 6 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER10_BGGR = 0x32
Bayer10 format - one channel in one surface with interleaved BGGR ordering. Out of 16 bits, 10 bits used 6 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER10_GRBG = 0x33
Bayer10 format - one channel in one surface with interleaved GRBG ordering. Out of 16 bits, 10 bits used 6 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER10_GBRG = 0x34
Bayer10 format - one channel in one surface with interleaved GBRG ordering. Out of 16 bits, 10 bits used 6 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER12_RGGB = 0x35
Bayer12 format - one channel in one surface with interleaved RGGB ordering. Out of 16 bits, 12 bits used 4 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER12_BGGR = 0x36
Bayer12 format - one channel in one surface with interleaved BGGR ordering. Out of 16 bits, 12 bits used 4 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER12_GRBG = 0x37
Bayer12 format - one channel in one surface with interleaved GRBG ordering. Out of 16 bits, 12 bits used 4 bits No-op.
CU_EGL_COLOR_FORMAT_BAYER12_GBRG = 0x38
Bayer12 format - one channel in one surface with interleaved GBRG ordering. Out of
16 bits, 12 bits used 4 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER14_RGGB = 0x39
Bayer14 format - one channel in one surface with interleaved RGGB ordering. Out of
16 bits, 14 bits used 2 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER14_BGGR = 0x3A
Bayer14 format - one channel in one surface with interleaved BGGR ordering. Out of
16 bits, 14 bits used 2 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER14_GRBG = 0x3B
Bayer14 format - one channel in one surface with interleaved GRBG ordering. Out of
16 bits, 14 bits used 2 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER14_GBRG = 0x3C
Bayer14 format - one channel in one surface with interleaved GBRG ordering. Out of
16 bits, 14 bits used 2 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER20_RGGB = 0x3D
Bayer20 format - one channel in one surface with interleaved RGGB ordering. Out of
32 bits, 20 bits used 12 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER20_BGGR = 0x3E
Bayer20 format - one channel in one surface with interleaved BGGR ordering. Out of
32 bits, 20 bits used 12 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER20_GRBG = 0x3F
Bayer20 format - one channel in one surface with interleaved GRBG ordering. Out of
32 bits, 20 bits used 12 bits No-op.

CU_EGL_COLOR_FORMAT_BAYER20_GBRG = 0x40
Bayer20 format - one channel in one surface with interleaved GBRG ordering. Out of
32 bits, 20 bits used 12 bits No-op.

CU_EGL_COLOR_FORMAT_YVU444_PLANAR = 0x41
Y, V, U in three surfaces, each in a separate surface, U/V width = Y width, U/V height
= Y height.

CU_EGL_COLOR_FORMAT_YVU422_PLANAR = 0x42
Y, V, U in three surfaces, each in a separate surface, U/V width = 1/2 Y width, U/V
height = Y height.

CU_EGL_COLOR_FORMAT_YVU420_PLANAR = 0x43
Y, V, U in three surfaces, each in a separate surface, U/V width = 1/2 Y width, U/V
height = 1/2 Y height.

CU_EGL_COLOR_FORMAT_BAYER_ISP_RGGB = 0x44
Nvidia proprietary Bayer ISP format - one channel in one surface with interleaved
RGGB ordering and mapped to opaque integer datatype.

CU_EGL_COLOR_FORMAT_BAYER_ISP_BGGR = 0x45
Nvidia proprietary Bayer ISP format - one channel in one surface with interleaved
BGGR ordering and mapped to opaque integer datatype.

CU_EGL_COLOR_FORMAT_BAYER_ISP_GRBG = 0x46
Nvidia proprietary Bayer ISP format - one channel in one surface with interleaved 
GRBG ordering and mapped to opaque integer datatype.

CU_EGL_COLOR_FORMAT_BAYER_ISP_GRBG = 0x47
Nvidia proprietary Bayer ISP format - one channel in one surface with interleaved 
GRBG ordering and mapped to opaque integer datatype.

CU_EGL_COLOR_FORMAT_MAX

enum CUeglFrameType
CUDA EglFrame type - array or pointer

Values

CU_EGL_FRAME_TYPE_ARRAY = 0
Frame type CUDA array
CU_EGL_FRAME_TYPE_PITCH = 1
Frame type pointer

enum CUeglResourceLocationFlags
Resource location flags- sysmem or vidmem
For CUDA context on iGPU, since video and system memory are equivalent - these flags 
will not have an effect on the execution.
For CUDA context on dGPU, applications can use the flag CUeglResourceLocationFlags 
to give a hint about the desired location.

CU_EGL_RESOURCE_LOCATION_SYSMEM - the frame data is made resident on the 
system memory to be accessed by CUDA.
CU_EGL_RESOURCE_LOCATION_VIDMEM - the frame data is made resident on the 
dedicated video memory to be accessed by CUDA.
There may be an additional latency due to new allocation and data migration, if the 
frame is produced on a different memory.

Values

CU_EGL_RESOURCE_LOCATION_SYSMEM = 0x00
Resource location sysmem
CU_EGL_RESOURCE_LOCATION_VIDMEM = 0x01
Resource location vidmem

enum CUevent_flags
Event creation flags
Values

CU_EVENT_DEFAULT = 0x0
    Default event flag
CU_EVENT_BLOCKING_SYNC = 0x1
    Event uses blocking synchronization
CU_EVENT_DISABLE_TIMING = 0x2
    Event will not record timing data
CU_EVENT_INTERPROCESS = 0x4
    Event is suitable for interprocess use. CU_EVENT_DISABLE_TIMING must be set

enum CUexternalMemoryHandleType

External memory handle types

Values

CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD = 1
    Handle is an opaque file descriptor
CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32 = 2
    Handle is an opaque shared NT handle
CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT = 3
    Handle is an opaque, globally shared handle
CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP = 4
    Handle is a D3D12 heap object
CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE = 5
    Handle is a D3D12 committed resource

enum CUexternalSemaphoreHandleType

External semaphore handle types

Values

CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD = 1
    Handle is an opaque file descriptor
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32 = 2
    Handle is an opaque shared NT handle
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT = 3
    Handle is an opaque, globally shared handle
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE = 4
    Handle is a shared NT handle referencing a D3D12 fence object

enum CUfilter_mode

Texture reference filtering modes
Values

CU_TR_FILTER_MODE_POINT = 0
Point filter mode
CU_TR_FILTER_MODE_LINEAR = 1
Linear filter mode

enum CUfunc_cache
Function cache configurations

Values

CU_FUNC_CACHE_PREFER_NONE = 0x00
no preference for shared memory or L1 (default)
CU_FUNC_CACHE_PREFER_SHARED = 0x01
prefer larger shared memory and smaller L1 cache
CU_FUNC_CACHE_PREFER_L1 = 0x02
prefer larger L1 cache and smaller shared memory
CU_FUNC_CACHE_PREFER_EQUAL = 0x03
prefer equal sized L1 cache and shared memory

enum CUfunction_attribute
Function properties

Values

CU_FUNC_ATTRIBUTE_MAX_THREADS_PER_BLOCK = 0
The maximum number of threads per block, beyond which a launch of the function
would fail. This number depends on both the function and the device on which the
function is currently loaded.
CU_FUNC_ATTRIBUTE_SHARED_SIZE_BYTES = 1
The size in bytes of statically-allocated shared memory required by this function.
This does not include dynamically-allocated shared memory requested by the user at
runtime.
CU_FUNC_ATTRIBUTE_CONST_SIZE_BYTES = 2
The size in bytes of user-allocated constant memory required by this function.
CU_FUNC_ATTRIBUTE_LOCAL_SIZE_BYTES = 3
The size in bytes of local memory used by each thread of this function.
CU_FUNC_ATTRIBUTE_NUM_REGS = 4
The number of registers used by each thread of this function.
CU_FUNC_ATTRIBUTE_PTX_VERSION = 5
The PTX virtual architecture version for which the function was compiled. This value
is the major PTX version * 10 + the minor PTX version, so a PTX version 1.3 function
would return the value 13. Note that this may return the undefined value of 0 for cubins compiled prior to CUDA 3.0.

CU_FUNC_ATTRIBUTE_BINARY_VERSION = 6
The binary architecture version for which the function was compiled. This value is the major binary version * 10 + the minor binary version, so a binary version 1.3 function would return the value 13. Note that this will return a value of 10 for legacy cubins that do not have a properly-encoded binary architecture version.

CU_FUNC_ATTRIBUTE_CACHE_MODE_CA = 7
The attribute to indicate whether the function has been compiled with user specified option "/Xptxas --dlcm=ca" set.

CU_FUNC_ATTRIBUTE_MAX_DYNAMIC_SHARED_SIZE_BYTES = 8
The maximum size in bytes of dynamically-allocated shared memory that can be used by this function. If the user-specified dynamic shared memory size is larger than this value, the launch will fail. See cuFuncSetAttribute

CU_FUNC_ATTRIBUTE_PREFERRED_SHARED_MEMORY_CARVEOUT = 9
On devices where the L1 cache and shared memory use the same hardware resources, this sets the shared memory carveout preference, in percent of the total shared memory. Refer to CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_MULTIPROCESSOR.
This is only a hint, and the driver can choose a different ratio if required to execute the function. See cuFuncSetAttribute

CU_FUNC_ATTRIBUTE_MAX

denum CUgraphicsMapResourceFlags

Flags for mapping and unmapping interop resources

Values

CU_GRAPHICS_MAP_RESOURCE_FLAGS_NONE = 0x00
CU_GRAPHICS_MAP_RESOURCE_FLAGS_READ_ONLY = 0x01
CU_GRAPHICS_MAP_RESOURCE_FLAGS_WRITE_DISCARD = 0x02

denum CUgraphicsRegisterFlags

Flags to register a graphics resource

Values

CU_GRAPHICS_REGISTER_FLAGS_NONE = 0x00
CU_GRAPHICS_REGISTER_FLAGS_READ_ONLY = 0x01
CU_GRAPHICS_REGISTER_FLAGS_WRITE_DISCARD = 0x02
CU_GRAPHICS_REGISTER_FLAGS_SURFACE_LDST = 0x04
CU_GRAPHICS_REGISTER_FLAGS_TEXTURE_GATHER = 0x08
enum CUgraphNodeType

Graph node types

Values

CU_GRAPH_NODE_TYPE_KERNEL = 0
    GPU kernel node
CU_GRAPH_NODE_TYPE_MEMCPY = 1
    Memcpy node
CU_GRAPH_NODE_TYPE_MEMSET = 2
    Memset node
CU_GRAPH_NODE_TYPE_HOST = 3
    Host (executable) node
CU_GRAPH_NODE_TYPE_GRAPH = 4
    Node which executes an embedded graph
CU_GRAPH_NODE_TYPE_EMPTY = 5
    Empty (no-op) node
CU_GRAPH_NODE_TYPE_COUNT

enum CUipcMem_flags

CUDA Ipc Mem Flags

Values

CU_IPC_MEM.LAZY_ENABLE_PEER_ACCESS = 0x1
    Automatically enable peer access between remote devices as needed

enum CUjit_cacheMode

Caching modes for dlcm

Values

CU_JIT_CACHE_OPTION_NONE = 0
    Compile with no -dlcm flag specified
CU_JIT_CACHE_OPTION_CG
    Compile with L1 cache disabled
CU_JIT_CACHE_OPTION_CA
    Compile with L1 cache enabled

enum CUjitFallback

Cubin matching fallback strategies
Values

CU_PREFER_PTX = 0
Prefer to compile ptx if exact binary match not found

CU_PREFER_BINARY
Prefer to fall back to compatible binary code if exact match not found

define enum CUjit_option

Values

CU_JIT_MAX_registers = 0
Max number of registers that a thread may use. Option type: unsigned int Applies to: compiler only

CU_JIT_THREADS_PER_BLOCK
IN: Specifies minimum number of threads per block to target compilation for OUT:
Returns the number of threads the compiler actually targeted. This restricts the
resource utilization fo the compiler (e.g. max registers) such that a block with the
given number of threads should be able to launch based on register limitations. Note,
this option does not currently take into account any other resource limitations, such
as shared memory utilization. Cannot be combined with CU_JIT_TARGET. Option
type: unsigned int Applies to: compiler only

CU_JIT_WALL_TIME
Overwrites the option value with the total wall clock time, in milliseconds, spent in
the compiler and linker Option type: float Applies to: compiler and linker

CU_JIT_INFO_LOG_BUFFER
Pointer to a buffer in which to print any log messages that are informational in nature
(the buffer size is specified via option CU_JIT_INFO_LOG_BUFFER_SIZE_BYTES)
Option type: char * Applies to: compiler and linker

CU_JIT_INFO_LOG_BUFFER_SIZE_BYTES
IN: Log buffer size in bytes. Log messages will be capped at this size (including null
terminator) OUT: Amount of log buffer filled with messages Option type: unsigned
int Applies to: compiler and linker

CU_JIT_ERROR_LOG_BUFFER
Pointer to a buffer in which to print any log messages that reflect errors (the buffer
size is specified via option CU_JIT_ERROR_LOG_BUFFER_SIZE_BYTES) Option
type: char * Applies to: compiler and linker

CU_JIT_ERROR_LOG_BUFFER_SIZE_BYTES
IN: Log buffer size in bytes. Log messages will be capped at this size (including null
terminator) OUT: Amount of log buffer filled with messages Option type: unsigned
int Applies to: compiler and linker

CU_JIT_OPTIMIZATION_LEVEL
Level of optimizations to apply to generated code (0 - 4), with 4 being the default and highest level of optimizations. Option type: unsigned int Applies to: compiler only

CU_JIT_TARGET_FROM_CUCONTEXT
No option value required. Determines the target based on the current attached context (default) Option type: No option value needed Applies to: compiler and linker

CU_JIT_TARGET
Target is chosen based on supplied CUjit_target. Cannot be combined with CU_JIT_THREADS_PER_BLOCK. Option type: unsigned int for enumerated type CUjit_target Applies to: compiler and linker

CU_JIT_FALLBACK_STRATEGY
Specifies choice of fallback strategy if matching cubin is not found. Choice is based on supplied CUjit_fallback. This option cannot be used with cuLink APIs as the linker requires exact matches. Option type: unsigned int for enumerated type CUjit_fallback Applies to: compiler only

CU_JIT_GENERATE_DEBUG_INFO
Specifies whether to create debug information in output (-g) (0: false, default) Option type: int Applies to: compiler and linker

CU_JIT_LOG_VERBOSE
Generate verbose log messages (0: false, default) Option type: int Applies to: compiler and linker

CU_JIT_GENERATE_LINE_INFO
Generate line number information (-lineinfo) (0: false, default) Option type: int Applies to: compiler only

CU_JIT_CACHE_MODE
Specifies whether to enable caching explicitly (-dlcm) Choice is based on supplied CUjit_cacheMode_enum. Option type: unsigned int for enumerated type CUjit_cacheMode_enum Applies to: compiler only

CU_JIT_NEW_SM3X_OPT
The below jit options are used for internal purposes only, in this version of CUDA

CU_JIT_FAST_COMPILE

CU_JIT_GLOBAL_SYMBOL_NAMES
Array of device symbol names that will be relocated to the corresponding host addresses stored in CU_JIT_GLOBAL_SYMBOL_ADDRESSES. Must contain CU_JIT_GLOBAL_SYMBOL_COUNT entries. When loading a device module, driver will relocate all encountered unresolved symbols to the host addresses. It is only allowed to register symbols that correspond to unresolved global variables. It is illegal to register the same device symbol at multiple addresses. Option type: const char ** Applies to: dynamic linker only

CU_JIT_GLOBAL_SYMBOL_ADDRESSES
Array of host addresses that will be used to relocate corresponding device symbols stored in CU_JIT_GLOBAL_SYMBOL_NAMES. Must contain
CU_JIT_GLOBAL_SYMBOL_COUNT entries. Option type: void ** Applies to: dynamic linker only
CU_JIT_GLOBAL_SYMBOL_COUNT
Number of entries in CU_JIT_GLOBAL_SYMBOL_NAMES and CU_JIT_GLOBAL_SYMBOL_ADDRESSES arrays. Option type: unsigned int Applies to: dynamic linker only
CU_JIT_NUM_OPTIONS

enum CUjit_target

Online compilation targets

Values

CU_TARGET_COMPUTE_20 = 20
    Compute device class 2.0
CU_TARGET_COMPUTE_21 = 21
    Compute device class 2.1
CU_TARGET_COMPUTE_30 = 30
    Compute device class 3.0
CU_TARGET_COMPUTE_32 = 32
    Compute device class 3.2
CU_TARGET_COMPUTE_35 = 35
    Compute device class 3.5
CU_TARGET_COMPUTE_37 = 37
    Compute device class 3.7
CU_TARGET_COMPUTE_50 = 50
    Compute device class 5.0
CU_TARGET_COMPUTE_52 = 52
    Compute device class 5.2
CU_TARGET_COMPUTE_53 = 53
    Compute device class 5.3
CU_TARGET_COMPUTE_60 = 60
    Compute device class 6.0.
CU_TARGET_COMPUTE_61 = 61
    Compute device class 6.1.
CU_TARGET_COMPUTE_62 = 62
    Compute device class 6.2.
CU_TARGET_COMPUTE_70 = 70
    Compute device class 7.0.
CU_TARGET_COMPUTE_72 = 72
    Compute device class 7.2.
CU_TARGET_COMPUTE_75 = 75
    Compute device class 7.5.
enum CUjitInputType

Device code formats

Values

CU_JIT_INPUT_CUBIN = 0
  Compiled device-class-specific device code Applicable options: none
CU_JIT_INPUT_PTX
  PTX source code Applicable options: PTX compiler options
CU_JIT_INPUT_FATBINARY
  Bundle of multiple cubins and/or PTX of some device code Applicable options: PTX compiler options, CU_JIT_FALLBACK_STRATEGY
CU_JIT_INPUT_OBJECT
  Host object with embedded device code Applicable options: PTX compiler options, CU_JIT_FALLBACK_STRATEGY
CU_JIT_INPUT_LIBRARY
  Archive of host objects with embedded device code Applicable options: PTX compiler options, CU_JIT_FALLBACK_STRATEGY
CU_JIT_NUM_INPUT_TYPES

enum CUlimit

Limits

Values

CU_LIMIT_STACK_SIZE = 0x00
  GPU thread stack size
CU_LIMIT_PRINTF_FIFO_SIZE = 0x01
  GPU printf FIFO size
CU_LIMIT_MALLOC_HEAP_SIZE = 0x02
  GPU malloc heap size
CU_LIMIT_DEV_RUNTIME_SYNC_DEPTH = 0x03
  GPU device runtime launch synchronize depth
CU_LIMIT_DEV_RUNTIME_PENDING_LAUNCH_COUNT = 0x04
  GPU device runtime pending launch count
CU_LIMIT_MAX_L2_FETCH_GRANULARITY = 0x05
  A value between 0 and 128 that indicates the maximum fetch granularity of L2 (in Bytes). This is a hint
CU_LIMIT_MAX
enum CUmem_advise

Memory advise values

Values

CU_MEM_ADVISE_SET_READ_MOSTLY = 1
Data will mostly be read and only occasionally be written to

CU_MEM_ADVISE_UNSET_READ_MOSTLY = 2
Undo the effect of CU_MEM_ADVISE_SET_READ_MOSTLY

CU_MEM_ADVISE_SET_PREFERRED_LOCATION = 3
Set the preferred location for the data as the specified device

CU_MEM_ADVISE_UNSET_PREFERRED_LOCATION = 4
Clear the preferred location for the data

CU_MEM_ADVISE_SET_ACCESSED_BY = 5
Data will be accessed by the specified device, so prevent page faults as much as possible

CU_MEM_ADVISE_UNSET_ACCESSED_BY = 6
Let the Unified Memory subsystem decide on the page faulting policy for the specified device

enum CUmemAttach_flags

CUDA Mem Attach Flags

Values

CU_MEM_ATTACH_GLOBAL = 0x1
Memory can be accessed by any stream on any device

CU_MEM_ATTACH_HOST = 0x2
Memory cannot be accessed by any stream on any device

CU_MEM_ATTACH_SINGLE = 0x4
Memory can only be accessed by a single stream on the associated device

enum CUMemorytype

Memory types

Values

CU_MEMORYTYPE_HOST = 0x01
Host memory

CU_MEMORYTYPE_DEVICE = 0x02
Device memory

CU_MEMORYTYPE_ARRAY = 0x03
Array memory
CU_MEMORYTYPE_UNIFIED = 0x04
Unified device or host memory

**enum CUoccupancy_flags**

Occupancy calculator flag

**Values**

CU_OCCUPANCY_DEFAULT = 0x0
Default behavior
CU_OCCUPANCY_DISABLE_CACHING_OVERRIDE = 0x1
Assume global caching is enabled and cannot be automatically turned off

**enum CUpointer_attribute**

Pointer information

**Values**

CU_POINTER_ATTRIBUTE_CONTEXT = 1
The CUcontext on which a pointer was allocated or registered
CU_POINTER_ATTRIBUTE_MEMORY_TYPE = 2
The CUmemorytype describing the physical location of a pointer
CU_POINTER_ATTRIBUTE_DEVICE_POINTER = 3
The address at which a pointer's memory may be accessed on the device
CU_POINTER_ATTRIBUTE_HOST_POINTER = 4
The address at which a pointer's memory may be accessed on the host
CU_POINTER_ATTRIBUTE_P2P_TOKENS = 5
A pair of tokens for use with the nv-p2p.h Linux kernel interface
CU_POINTER_ATTRIBUTE_SYNC_MEMOPS = 6
Synchronize every synchronous memory operation initiated on this region
CU_POINTER_ATTRIBUTE_BUFFER_ID = 7
A process-wide unique ID for an allocated memory region
CU_POINTER_ATTRIBUTE_IS_MANAGED = 8
Indicates if the pointer points to managed memory
CU_POINTER_ATTRIBUTE_DEVICE_ORDINAL = 9
A device ordinal of a device on which a pointer was allocated or registered

**enum Curesourcetype**

Resource types
Values

CU_RESOURCE_TYPE_ARRAY = 0x00
Array resource
CU_RESOURCE_TYPE_MIPMAPPED_ARRAY = 0x01
Mipmapped array resource
CU_RESOURCE_TYPE_LINEAR = 0x02
Linear resource
CU_RESOURCE_TYPE_PITCH2D = 0x03
Pitch 2D resource

enum CUresourceViewFormat
Resource view format

Values

CU_RES_VIEW_FORMAT_NONE = 0x00
No resource view format (use underlying resource format)
CU_RES_VIEW_FORMAT_UINT_1X8 = 0x01
1 channel unsigned 8-bit integers
CU_RES_VIEW_FORMAT_UINT_2X8 = 0x02
2 channel unsigned 8-bit integers
CU_RES_VIEW_FORMAT_UINT_4X8 = 0x03
4 channel unsigned 8-bit integers
CU_RES_VIEW_FORMAT_SINT_1X8 = 0x04
1 channel signed 8-bit integers
CU_RES_VIEW_FORMAT_SINT_2X8 = 0x05
2 channel signed 8-bit integers
CU_RES_VIEW_FORMAT_SINT_4X8 = 0x06
4 channel signed 8-bit integers
CU_RES_VIEW_FORMAT_UINT_1X16 = 0x07
1 channel unsigned 16-bit integers
CU_RES_VIEW_FORMAT_UINT_2X16 = 0x08
2 channel unsigned 16-bit integers
CU_RES_VIEW_FORMAT_UINT_4X16 = 0x09
4 channel unsigned 16-bit integers
CU_RES_VIEW_FORMAT_SINT_1X16 = 0x0a
1 channel signed 16-bit integers
CU_RES_VIEW_FORMAT_SINT_2X16 = 0x0b
2 channel signed 16-bit integers
CU_RES_VIEW_FORMAT_SINT_4X16 = 0x0c
4 channel signed 16-bit integers
CU_RES_VIEW_FORMAT_UINT_1X32 = 0x0d
1 channel unsigned 32-bit integers
CU_RES_VIEW_FORMAT_UINT_2X32 = 0x0e
  2 channel unsigned 32-bit integers
CU_RES_VIEW_FORMAT_UINT_4X32 = 0x0f
  4 channel unsigned 32-bit integers
CU_RES_VIEW_FORMAT_SINT_1X32 = 0x10
  1 channel signed 32-bit integers
CU_RES_VIEW_FORMAT_SINT_2X32 = 0x11
  2 channel signed 32-bit integers
CU_RES_VIEW_FORMAT_SINT_4X32 = 0x12
  4 channel signed 32-bit integers
CU_RES_VIEW_FORMAT_FLOAT_1X16 = 0x13
  1 channel 16-bit floating point
CU_RES_VIEW_FORMAT_FLOAT_2X16 = 0x14
  2 channel 16-bit floating point
CU_RES_VIEW_FORMAT_FLOAT_4X16 = 0x15
  4 channel 16-bit floating point
CU_RES_VIEW_FORMAT_FLOAT_1X32 = 0x16
  1 channel 32-bit floating point
CU_RES_VIEW_FORMAT_FLOAT_2X32 = 0x17
  2 channel 32-bit floating point
CU_RES_VIEW_FORMAT_FLOAT_4X32 = 0x18
  4 channel 32-bit floating point
CU_RES_VIEW_FORMAT_UNSIGNED_BC1 = 0x19
  Block compressed 1
CU_RES_VIEW_FORMAT_UNSIGNED_BC2 = 0x1a
  Block compressed 2
CU_RES_VIEW_FORMAT_UNSIGNED_BC3 = 0x1b
  Block compressed 3
CU_RES_VIEW_FORMAT_UNSIGNED_BC4 = 0x1c
  Block compressed 4 unsigned
CU_RES_VIEW_FORMAT_SIGNED_BC4 = 0x1d
  Block compressed 4 signed
CU_RES_VIEW_FORMAT_UNSIGNED_BC5 = 0x1e
  Block compressed 5 unsigned
CU_RES_VIEW_FORMAT_SIGNED_BC5 = 0x1f
  Block compressed 5 signed
CU_RES_VIEW_FORMAT_UNSIGNED_BC6H = 0x20
  Block compressed 6 unsigned half-float
CU_RES_VIEW_FORMAT_SIGNED_BC6H = 0x21
  Block compressed 6 signed half-float
CU_RES_VIEW_FORMAT_UNSIGNED_BC7 = 0x22
  Block compressed 7
enum CUresult

Error codes

Values

CUDA_SUCCESS = 0

The API call returned with no errors. In the case of query calls, this also means that
the operation being queried is complete (see cuEventQuery() and cuStreamQuery()).

CUDA_ERROR_INVALID_VALUE = 1

This indicates that one or more of the parameters passed to the API call is not within
an acceptable range of values.

CUDA_ERROR_OUT_OF_MEMORY = 2

The API call failed because it was unable to allocate enough memory to perform the
requested operation.

CUDA_ERROR_NOT_INITIALIZED = 3

This indicates that the CUDA driver has not been initialized with cuInit() or that
initialization has failed.

CUDA_ERROR_DEINITIALIZED = 4

This indicates that the CUDA driver is in the process of shutting down.

CUDA_ERROR_PROFILER.Disabled = 5

This indicates profiler is not initialized for this run. This can happen when the
application is running with external profiling tools like visual profiler.

CUDA_ERROR_PROFILER_NOT_INITIALIZED = 6

Deprecated This error return is deprecated as of CUDA 5.0. It is no longer an error to
attempt to enable/disable the profiling via cuProfilerStart or cuProfilerStop without
initialization.

CUDA_ERROR_PROFILER_ALREADY_STARTED = 7

Deprecated This error return is deprecated as of CUDA 5.0. It is no longer an error to
call cuProfilerStart() when profiling is already enabled.

CUDA_ERROR_PROFILER_ALREADY_STOPPED = 8

Deprecated This error return is deprecated as of CUDA 5.0. It is no longer an error to
call cuProfilerStop() when profiling is already disabled.

CUDA_ERROR_NO_DEVICE = 100

This indicates that no CUDA-capable devices were detected by the installed CUDA
driver.

CUDA_ERROR_INVALID_DEVICE = 101

This indicates that the device ordinal supplied by the user does not correspond to a
valid CUDA device.

CUDA_ERROR_INVALID_IMAGE = 200

This indicates that the device kernel image is invalid. This can also indicate an invalid
CUDA module.

CUDA_ERROR_INVALID_CONTEXT = 201
This most frequently indicates that there is no context bound to the current thread. This can also be returned if the context passed to an API call is not a valid handle (such as a context that has had cuCxtDestroy() invoked on it). This can also be returned if a user mixes different API versions (i.e. 3010 context with 3020 API calls). See cuCtxGetApiVersion() for more details.

CUDA_ERROR_CONTEXT_ALREADY_CURRENT = 202
This indicated that the context being supplied as a parameter to the API call was already the active context. Deprecated This error return is deprecated as of CUDA 3.2. It is no longer an error to attempt to push the active context via cuCtxPushCurrent().

CUDA_ERROR_MAP_FAILED = 205
This indicates that a map or register operation has failed.

CUDA_ERROR_UNMAP_FAILED = 206
This indicates that an unmap or unregister operation has failed.

CUDA_ERROR_ARRAY_IS_MAPPED = 207
This indicates that the specified array is currently mapped and thus cannot be destroyed.

CUDA_ERROR_ALREADY_MAPPED = 208
This indicates that the resource is already mapped.

CUDA_ERROR_NO_BINARY_FOR_GPU = 209
This indicates that there is no kernel image available that is suitable for the device. This can occur when a user specifies code generation options for a particular CUDA source file that do not include the corresponding device configuration.

CUDA_ERROR_ALREADY_ACQUIRED = 210
This indicates that a resource has already been acquired.

CUDA_ERROR_NOT_MAPPED = 211
This indicates that a resource is not mapped.

CUDA_ERROR_NOT_MAPPED_AS_ARRAY = 212
This indicates that a mapped resource is not available for access as an array.

CUDA_ERROR_NOT_MAPPED_AS_POINTER = 213
This indicates that a mapped resource is not available for access as a pointer.

CUDA_ERROR_ECC_UNCORRECTABLE = 214
This indicates that an uncorrectable ECC error was detected during execution.

CUDA_ERROR_UNSUPPORTED_LIMIT = 215
This indicates that the CUlimit passed to the API call is not supported by the active device.

CUDA_ERROR_CONTEXT_ALREADY_IN_USE = 216
This indicates that the CUcontext passed to the API call can only be bound to a single CPU thread at a time but is already bound to a CPU thread.

CUDA_ERROR_PEER_ACCESS_UNSUPPORTED = 217
This indicates that peer access is not supported across the given devices.

CUDA_ERROR_INVALID_PTX = 218
This indicates that a PTX JIT compilation failed.
CUDA_ERROR_INVALID_GRAPHICSCONTEXT = 219
This indicates an error with OpenGL or DirectX context.

CUDA_ERROR_NVLINK_UNCORRECTABLE = 220
This indicates that an uncorrectable NVLink error was detected during the execution.

CUDA_ERROR_JIT_COMPILER_NOT_FOUND = 221
This indicates that the PTX JIT compiler library was not found.

CUDA_ERROR_INVALIDSOURCE = 300
This indicates that the device kernel source is invalid.

CUDA_ERROR_FILE_NOT_FOUND = 301
This indicates that the file specified was not found.

CUDA_ERROR_SHARED_OBJECT_SYMBOL_NOT_FOUND = 302
This indicates that a link to a shared object failed to resolve.

CUDA_ERROR_SHARED_OBJECT_INIT_FAILED = 303
This indicates that initialization of a shared object failed.

CUDA_ERROR_OPERATING_SYSTEM = 304
This indicates that an OS call failed.

CUDA_ERROR_INVALID_HANDLE = 400
This indicates that a resource handle passed to the API call was not valid. Resource handles are opaque types like CUstream and CUevent.

CUDA_ERROR_ILLEGAL_STATE = 401
This indicates that a resource required by the API call is not in a valid state to perform the requested operation.

CUDA_ERROR_NOT_FOUND = 500
This indicates that a named symbol was not found. Examples of symbols are global/constant variable names, texture names, and surface names.

CUDA_ERROR_NOT_READY = 600
This indicates that asynchronous operations issued previously have not completed yet. This result is not actually an error, but must be indicated differently than CUDA_SUCCESS (which indicates completion). Calls that may return this value include cuEventQuery() and cuStreamQuery().

CUDA_ERROR_ILLEGAL_ADDRESS = 700
While executing a kernel, the device encountered a load or store instruction on an invalid memory address. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES = 701
This indicates that a launch did not occur because it did not have appropriate resources. This error usually indicates that the user has attempted to pass too many arguments to the device kernel, or the kernel launch specifies too many threads for the kernel’s register count. Passing arguments of the wrong size (i.e. a 64-bit pointer when a 32-bit int is expected) is equivalent to passing too many arguments and can also result in this error.

CUDA_ERROR_LAUNCH_TIMEOUT = 702
This indicates that the device kernel took too long to execute. This can only occur if timeouts are enabled - see the device attribute `CU_DEVICE_ATTRIBUTE_KERNEL_EXEC_TIMEOUT` for more information. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING = 703
This error indicates a kernel launch that uses an incompatible texturing mode.

CUDA_ERROR_PEER_ACCESS_ALREADY_ENABLED = 704
This error indicates that a call to `cuCtxEnablePeerAccess()` is trying to re-enable peer access to a context which has already had peer access to it enabled.

CUDA_ERROR_PEER_ACCESS_NOT_ENABLED = 705
This error indicates that `cuCtxDisablePeerAccess()` is trying to disable peer access which has not been enabled yet via `cuCtxEnablePeerAccess()`.

CUDA_ERROR_PRIMARY_CONTEXT_ACTIVE = 708
This error indicates that the primary context for the specified device has already been initialized.

CUDA_ERROR_CONTEXT_IS_DESTROYED = 709
This error indicates that the context current to the calling thread has been destroyed using `cuCtxDestroy`, or is a primary context which has not yet been initialized.

CUDA_ERROR_ASSERT = 710
A device-side assert triggered during kernel execution. The context cannot be used anymore, and must be destroyed. All existing device memory allocations from this context are invalid and must be reconstructed if the program is to continue using CUDA.

CUDA_ERROR_TOO_MANY_PEERS = 711
This error indicates that the hardware resources required to enable peer access have been exhausted for one or more of the devices passed to `cuCtxEnablePeerAccess()`.

CUDA_ERROR_HOST_MEMORY_ALREADY_REGISTERED = 712
This error indicates that the memory range passed to `cuMemHostRegister()` has already been registered.

CUDA_ERROR_HOST_MEMORY_NOT_REGISTERED = 713
This error indicates that the pointer passed to `cuMemHostUnregister()` does not correspond to any currently registered memory region.

CUDA_ERROR_HARDWARE_STACK_ERROR = 714
While executing a kernel, the device encountered a stack error. This can be due to stack corruption or exceeding the stack size limit. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_ILLEGAL_INSTRUCTION = 715
While executing a kernel, the device encountered an illegal instruction. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.
CUDA_ERROR_MISALIGNED_ADDRESS = 716
While executing a kernel, the device encountered a load or store instruction on a memory address which is not aligned. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_INVALID_ADDRESS_SPACE = 717
While executing a kernel, the device encountered an instruction which can only operate on memory locations in certain address spaces (global, shared, or local), but was supplied a memory address not belonging to an allowed address space. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_INVALID_PC = 718
While executing a kernel, the device program counter wrapped its address space. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_LAUNCH_FAILED = 719
An exception occurred on the device while executing a kernel. Common causes include dereferencing an invalid device pointer and accessing out of bounds shared memory. Less common cases can be system specific - more information about these cases can be found in the system specific user guide. This leaves the process in an inconsistent state and any further CUDA work will return the same error. To continue using CUDA, the process must be terminated and relaunched.

CUDA_ERROR_COOPERATIVE_LAUNCH_TOO_LARGE = 720
This error indicates that the number of blocks launched per grid for a kernel that was launched via either cuLaunchCooperativeKernel or cuLaunchCooperativeKernelMultiDevice exceeds the maximum number of blocks as allowed by cuOccupancyMaxActiveBlocksPerMultiprocessor or cuOccupancyMaxActiveBlocksPerMultiprocessorWithFlags times the number of multiprocessors as specified by the device attribute CU_DEVICE_ATTRIBUTE_MULTIPROCESSOR_COUNT.

CUDA_ERROR_NOT_PERMITTED = 800
This error indicates that the attempted operation is not permitted.

CUDA_ERROR_NOT_SUPPORTED = 801
This error indicates that the attempted operation is not supported on the current system or device.

CUDA_ERROR_SYSTEM_NOT_READY = 802
This error indicates that the system is not yet ready to start any CUDA work. To continue using CUDA, verify the system configuration is in a valid state and all required driver daemons are actively running. More information about this error can be found in the system specific user guide.

CUDA_ERROR_SYSTEM_DRIVER_MISMATCH = 803
This error indicates that there is a mismatch between the versions of the display driver and the CUDA driver. Refer to the compatibility documentation for supported versions.

**CUDA_ERROR_COMPAT_NOT_SUPPORTED_ON_DEVICE = 804**

This error indicates that the system was upgraded to run with forward compatibility but the visible hardware detected by CUDA does not support this configuration. Refer to the compatibility documentation for the supported hardware matrix or ensure that only supported hardware is visible during initialization via the CUDA_VISIBLE_DEVICES environment variable.

**CUDA_ERROR_STREAM_CAPTURE_UNSUPPORTED = 900**

This error indicates that the operation is not permitted when the stream is capturing.

**CUDA_ERROR_STREAM_CAPTURE_INVALIDATED = 901**

This error indicates that the current capture sequence on the stream has been invalidated due to a previous error.

**CUDA_ERROR_STREAM_CAPTURE_MERGE = 902**

This error indicates that the operation would have resulted in a merge of two independent capture sequences.

**CUDA_ERROR_STREAM_CAPTURE_UNMATCHED = 903**

This error indicates that the capture was not initiated in this stream.

**CUDA_ERROR_STREAM_CAPTURE_UNJOINED = 904**

This error indicates that the capture sequence contains a fork that was not joined to the primary stream.

**CUDA_ERROR_STREAM_CAPTURE_ISOLATION = 905**

This error indicates that a dependency would have been created which crosses the capture sequence boundary. Only implicit in-stream ordering dependencies are allowed to cross the boundary.

**CUDA_ERROR_STREAM_CAPTURE_IMPLICIT = 906**

This error indicates a disallowed implicit dependency on a current capture sequence from cudaStreamLegacy.

**CUDA_ERROR_CAPTURED_EVENT = 907**

This error indicates that the operation is not permitted on an event which was last recorded in a capturing stream.

**CUDA_ERROR_STREAM_CAPTURE_WRONG_THREAD = 908**

A stream capture sequence not initiated with the 
CU_STREAM_CAPTURE_MODE_RELAXED argument to cuStreamBeginCapture 
was passed to cuStreamEndCapture in a different thread.

**CUDA_ERROR_UNKNOWN = 999**

This indicates that an unknown internal error has occurred.

---

**enum CUshared_carveout**

Shared memory carveout configurations. These may be passed to cuFuncSetAttribute
Values

CU_SHARED_MEM_CARVEOUT_DEFAULT = -1
  No preference for shared memory or L1 (default)
CU_SHARED_MEM_CARVEOUT_MAX_SHARED = 100
  Prefer maximum available shared memory, minimum L1 cache
CU_SHARED_MEM_CARVEOUT_MAX_L1 = 0
  Prefer maximum available L1 cache, minimum shared memory

enum CUsharedconfig

Shared memory configurations

Values

CU_SHARED_MEM_CONFIG_DEFAULT_BANK_SIZE = 0x00
  set default shared memory bank size
CU_SHARED_MEM_CONFIG_FOUR_BYTE_BANK_SIZE = 0x01
  set shared memory bank width to four bytes
CU_SHARED_MEM_CONFIG_EIGHT_BYTE_BANK_SIZE = 0x02
  set shared memory bank width to eight bytes

enum CUstream_flags

Stream creation flags

Values

CU_STREAM_DEFAULT = 0x0
  Default stream flag
CU_STREAM_NON_BLOCKING = 0x1
  Stream does not synchronize with stream 0 (the NULL stream)

enum CUstreamBatchMemOpType

Operations for cuStreamBatchMemOp

Values

CU_STREAM_MEM_OP_WAIT_VALUE_32 = 1
  Represents a cuStreamWaitValue32 operation
CU_STREAM_MEM_OP_WRITE_VALUE_32 = 2
  Represents a cuStreamWriteValue32 operation
CU_STREAM_MEM_OP_WAIT_VALUE_64 = 4
  Represents a cuStreamWaitValue64 operation
CU_STREAM_MEM_OP_WRITE_VALUE_64 = 5
  Represents a cuStreamWriteValue64 operation
CU_STREAM_MEM_OP_FLUSH_REMOTE_WRITES = 3
This has the same effect as CU_STREAM_WAIT_VALUE_FLUSH, but as a standalone operation.

enum CUstreamCaptureMode

Possible modes for stream capture thread interactions. For more details see cuStreamBeginCapture and cuThreadExchangeStreamCaptureMode

Values

CU_STREAM_CAPTURE_MODE_GLOBAL = 0
CU_STREAM_CAPTURE_MODE_THREAD_LOCAL = 1
CU_STREAM_CAPTURE_MODE_RELAXED = 2

enum CUstreamCaptureStatus

Possible stream capture statuses returned by cuStreamIsCapturing

Values

CU_STREAM_CAPTURE_STATUS_NONE = 0
Stream is not capturing
CU_STREAM_CAPTURE_STATUS_ACTIVE = 1
Stream is actively capturing
CU_STREAM_CAPTURE_STATUS_INVALIDATED = 2
Stream is part of a capture sequence that has been invalidated, but not terminated

enum CUstreamWaitValue_flags

Flags for cuStreamWaitValue32 and cuStreamWaitValue64

Values

CU_STREAM_WAIT_VALUE_GEQ = 0x0
Wait until (int32_t)(*addr - value) >= 0 (or int64_t for 64 bit values). Note this is a cyclic comparison which ignores wraparound. (Default behavior.)
CU_STREAM_WAIT_VALUE_EQ = 0x1
Wait until *addr == value.
CU_STREAM_WAIT_VALUE_AND = 0x2
Wait until (*addr & value) != 0.
CU_STREAM_WAIT_VALUE_NOR = 0x3
Wait until ~(*addr | value) != 0. Support for this operation can be queried with cuDeviceGetAttribute() and CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_WAIT_VALUE_NOR.
CU_STREAM_WAIT_VALUE_FLUSH = 1<<30
Follow the wait operation with a flush of outstanding remote writes. This means that, if a remote write operation is guaranteed to have reached the device before the wait can be satisfied, that write is guaranteed to be visible to downstream device work. The device is permitted to reorder remote writes internally. For example, this flag would be required if two remote writes arrive in a defined order, the wait is satisfied by the second write, and downstream work needs to observe the first write. Support for this operation is restricted to selected platforms and can be queried with `CU_DEVICE_ATTRIBUTE_CAN_USE_WAIT_VALUE_FLUSH`.

```plaintext
class enum CUstreamWriteValue_flags

Flags for `cuStreamWriteValue32`

Values

- `CU_STREAM_WRITE_VALUE_DEFAULT = 0x0`
- `CU_STREAM_WRITE_VALUE_NO_MEMORY_BARRIER = 0x1`

Permits the write to be reordered with writes which were issued before it, as a performance optimization. Normally, `cuStreamWriteValue32` will provide a memory fence before the write, which has similar semantics to `__threadfence_system()` but is scoped to the stream rather than a CUDA thread.
```

typedef struct CUarray_st *CUarray

CUDA array

typedef struct CUctx_st *CUcontext

CUDA context

typedef int CUdevice

CUDA device

typedef unsigned int CUdeviceptr

CUDA device pointer CUdeviceptr is defined as an unsigned integer type whose size matches the size of a pointer on the target platform.

typedef struct CUeglStreamConnection_st *CUeglStreamConnection

CUDA EGLStream Connection
typedef struct CUevent_st *CUevent
CUDA event

typedef struct CUextMemory_st *CUexternalMemory
CUDA external memory

typedef struct CUextSemaphore_st *CUexternalSemaphore
CUDA external semaphore

typedef struct CUfunc_st *CUfunction
CUDA function

typedef struct CUgraph_st *CUgraph
CUDA graph

typedef struct CUgraphExec_st *CUgraphExec
CUDA executable graph

typedef struct CUgraphicsResource_st *CUgraphicsResource
CUDA graphics interop resource

typedef struct CUgraphNode_st *CUgraphNode
CUDA graph node

typedef void (CUDA_CB *CUhostFn) (void* userData)
CUDA host function

typedef struct CUmipmappedArray_st *CUmipmappedArray
CUDA mipmapped array
typedef struct CUmod_st *CUmodule
CUDA module

typedef size_t (CUDA_CB *CUoccupancyB2DSize) (int blockSize)
Block size to per-block dynamic shared memory mapping for a certain kernel

typedef struct CUstream_st *CUstream
CUDA stream

typedef void (CUDA_CB *CUstreamCallback) (CUstream hStream, CUresult status, void* userData)
CUDA stream callback

typedef unsigned long long CUsurfObject
An opaque value that represents a CUDA surface object

typedef struct CUsurfref_st *CUsurfref
CUDA surface reference

typedef unsigned long long CUtexObject
An opaque value that represents a CUDA texture object

typedef struct CUtexref_st *CUtexref
CUDA texture reference

#define CU_DEVICE_CPU ((CUdevice)-1)
Device that represents the CPU

#define CU_DEVICE_INVALID ((CUdevice)-2)
Device that represents an invalid device
#define CU_IPC_HANDLE_SIZE 64
CUDA IPC handle size

#define CU_LAUNCH_PARAM_BUFFER_POINTER ((void*)0x01)
Indicator that the next value in the extra parameter to cuLaunchKernel will be a pointer to a buffer containing all kernel parameters used for launching kernel f. This buffer needs to honor all alignment/padding requirements of the individual parameters. If CU_LAUNCH_PARAM_BUFFER_SIZE is not also specified in the extra array, then CU_LAUNCH_PARAM_BUFFER_POINTER will have no effect.

#define CU_LAUNCH_PARAM_BUFFER_SIZE ((void*)0x02)
Indicator that the next value in the extra parameter to cuLaunchKernel will be a pointer to a size_t which contains the size of the buffer specified with CU_LAUNCH_PARAM_BUFFER_POINTER. It is required that CU_LAUNCH_PARAM_BUFFER_POINTER also be specified in the extra array if the value associated with CU_LAUNCH_PARAM_BUFFER_SIZE is not zero.

#define CU_LAUNCH_PARAM_END ((void*)0x00)
End of array terminator for the extra parameter to cuLaunchKernel

#define CU_MEMHOSTALLOC_DEVICEMAP 0x02
If set, host memory is mapped into CUDA address space and cuMemHostGetDevicePointer() may be called on the host pointer. Flag for cuMemHostAlloc()

#define CU_MEMHOSTALLOC_PORTABLE 0x01
If set, host memory is portable between CUDA contexts. Flag for cuMemHostAlloc()

#define CU_MEMHOSTALLOC_WRITECOMBINED 0x04
If set, host memory is allocated as write-combined - fast to write, faster to DMA, slow to read except via SSE4 streaming load instruction (MOVNTDQA). Flag for cuMemHostAlloc()
#define CU_MEMHOSTREGISTER_DEVICEMAP 0x02

If set, host memory is mapped into CUDA address space and `cuMemHostGetDevicePointer()` may be called on the host pointer. Flag for `cuMemHostRegister()`

#define CU_MEMHOSTREGISTER_IOMEMORY 0x04

If set, the passed memory pointer is treated as pointing to some memory-mapped I/O space, e.g. belonging to a third-party PCIe device. On Windows the flag is a no-op. On Linux that memory is marked as non cache-coherent for the GPU and is expected to be physically contiguous. It may return CUDA_ERROR_NOT_PERMITTED if run as an unprivileged user, CUDA_ERROR_NOT_SUPPORTED on older Linux kernel versions. On all other platforms, it is not supported and CUDA_ERROR_NOT_SUPPORTED is returned. Flag for `cuMemHostRegister()`

#define CU_MEMHOSTREGISTER_PORTABLE 0x01

If set, host memory is portable between CUDA contexts. Flag for `cuMemHostRegister()`

#define CU_PARAM_TR_DEFAULT -1

For texture references loaded into the module, use default texunit from texture reference.

#define CU_STREAM_LEGACY ((CUstream)0x1)

Legacy stream handle

Stream handle that can be passed as a CUstream to use an implicit stream with legacy synchronization behavior.

See details of the synchronization behavior.

#define CU_STREAM_PER_THREAD ((CUstream)0x2)

Per-thread stream handle

Stream handle that can be passed as a CUstream to use an implicit stream with per-thread synchronization behavior.

See details of the synchronization behavior.
#define CU_TRSA_OVERRIDE_FORMAT 0x01
Override the texref format with a format inferred from the array. Flag for cuTexRefSetArray()

#define CU_TRSF_NORMALIZED_COORDINATES 0x02
Use normalized texture coordinates in the range [0,1) instead of [0,dim). Flag for cuTexRefSetFlags()

#define CU_TRSF_READ_AS_INTEGER 0x01
Read the texture as integers rather than promoting the values to floats in the range [0,1]. Flag for cuTexRefSetFlags()

#define CU_TRSF_SRGB 0x10
Perform sRGB->linear conversion during texture read. Flag for cuTexRefSetFlags()

#define CUDA_ARRAY3D_2DARRAY 0x01
Deprecated, use CUDA_ARRAY3D_LAYERED

#define CUDA_ARRAY3D_COLOR_ATTACHMENT 0x20
This flag indicates that the CUDA array may be bound as a color target in an external graphics API

#define CUDA_ARRAY3D_CUBEMAP 0x04
If set, the CUDA array is a collection of six 2D arrays, representing faces of a cube. The width of such a CUDA array must be equal to its height, and Depth must be six. If CUDA_ARRAY3D_LAYERED flag is also set, then the CUDA array is a collection of cubemaps and Depth must be a multiple of six.

#define CUDA_ARRAY3D_DEPTH_TEXTURE 0x10
This flag if set indicates that the CUDA array is a DEPTH_TEXTURE.

#define CUDA_ARRAY3D_LAYERED 0x01
If set, the CUDA array is a collection of layers, where each layer is either a 1D or a 2D array and the Depth member of CUDA_ARRAY3D_DESCRIPTOR specifies the number of layers, not the depth of a 3D array.
#define CUDA_ARRAY3D_SURFACE_LDST 0x02
This flag must be set in order to bind a surface reference to the CUDA array

#define CUDA_ARRAY3D_TEXTURE_GATHER 0x08
This flag must be set in order to perform texture gather operations on a CUDA array.

#define CUDA_COOPERATIVE_LAUNCH_MULTI_DEVICE_NO_POST_LAUNCH_SYNC 0x02
If set, any subsequent work pushed in a stream that participated in a call to cuLaunchCooperativeKernelMultiDevice will only wait for the kernel launched on the GPU corresponding to that stream to complete before it begins execution.

#define CUDA_COOPERATIVE_LAUNCH_MULTI_DEVICE_NO_PRE_LAUNCH_SYNC 0x01
If set, each kernel launched as part of cuLaunchCooperativeKernelMultiDevice only waits for prior work in the stream corresponding to that GPU to complete before the kernel begins execution.

#define CUDA_EXTERNAL_MEMORY_DEDICATED 0x1
Indicates that the external memory object is a dedicated resource

#define CUDA_VERSION 10010
CUDA API version number

#define MAX_PLANES 3
Maximum number of planes per frame

5.2. Error Handling

This section describes the error handling functions of the low-level CUDA driver application programming interface.
CUresult cuGetErrorName (CUresult error, const char **pStr)

Gets the string representation of an error code enum name.

Parameters

error
- Error code to convert to string

pStr
- Address of the string pointer.

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE

Description

Sets *pStr to the address of a NULL-terminated string representation of the name of the enum error code error. If the error code is not recognized, CUDA_ERROR_INVALID_VALUE will be returned and *pStr will be set to the NULL address.

See also:
CUresult, cudaGetErrorName

CUresult cuGetErrorString (CUresult error, const char **pStr)

Gets the string description of an error code.

Parameters

error
- Error code to convert to string

pStr
- Address of the string pointer.

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE
Description

Sets \*pStr to the address of a NULL-terminated string description of the error code error. If the error code is not recognized, CUDA_ERROR_INVALID_VALUE will be returned and \*pStr will be set to the NULL address.

See also:
CUresult, cudaGetErrorString

5.3. Initialization

This section describes the initialization functions of the low-level CUDA driver application programming interface.

CUresult cuInit (unsigned int Flags)
Initialize the CUDA driver API.

Parameters
Flags
- Initialization flag for CUDA.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_INVALID_DEVICE, CUDA_ERROR_SYSTEM_DRIVER_MISMATCH,
CUDA_ERROR_COMPAT_NOT_SUPPORTED_ON_DEVICE

Description

Initializes the driver API and must be called before any other function from the driver API. Currently, the Flags parameter must be 0. If cuInit() has not been called, any function from the driver API will return CUDA_ERROR_NOT_INITIALIZED.

Note that this function may also return error codes from previous, asynchronous launches.

5.4. Version Management

This section describes the version management functions of the low-level CUDA driver application programming interface.
CUresult cuDriverGetVersion (int *driverVersion)
Returns the latest CUDA version supported by driver.

Parameters

driverVersion
- Returns the CUDA driver version

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE

Description

Returns in *driverVersion the version of CUDA supported by the driver. The version is returned as (1000 major + 10 minor). For example, CUDA 9.2 would be represented by 9020.

This function automatically returns CUDA_ERROR_INVALID_VALUE if driverVersion is NULL.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cudaDriverGetVersion, cudaRuntimeGetVersion

5.5. Device Management

This section describes the device management functions of the low-level CUDA driver application programming interface.

CUresult cuDeviceGet (CUdevice *device, int ordinal)
Returns a handle to a compute device.

Parameters

device
- Returned device handle

ordinal
- Device number to get handle for
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description

Returns in *device a device handle given an ordinal in the range [0, cuDeviceGetCount()-1].

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuDeviceGetAttribute, cuDeviceGetCount, cuDeviceGetName, cuDeviceGetUuid,
cuDeviceGetLuid, cuDeviceTotalMem

CUresult cuDeviceGetAttribute (int *pi,
CUdevice_attribute attrib, CUdevice dev)

Returns information about the device.

Parameters

pi
  - Returned device attribute value
attrib
  - Device attribute to query
dev
  - Device handle

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description

Returns in *pi the integer value of the attribute attrib on device dev. The supported attributes are:

- CU_DEVICE_ATTRIBUTE_MAX_THREADS_PER_BLOCK: Maximum number of threads per block;
- **CU_DEVICE_ATTRIBUTE_MAX_BLOCK_DIM_X**: Maximum x-dimension of a block;
- **CU_DEVICE_ATTRIBUTE_MAX_BLOCK_DIM_Y**: Maximum y-dimension of a block;
- **CU_DEVICE_ATTRIBUTE_MAX_BLOCK_DIM_Z**: Maximum z-dimension of a block;
- **CU_DEVICE_ATTRIBUTE_MAX_GRID_DIM_X**: Maximum x-dimension of a grid;
- **CU_DEVICE_ATTRIBUTE_MAX_GRID_DIM_Y**: Maximum y-dimension of a grid;
- **CU_DEVICE_ATTRIBUTE_MAX_GRID_DIM_Z**: Maximum z-dimension of a grid;
- **CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_BLOCK**: Maximum amount of shared memory available to a thread block in bytes;
- **CU_DEVICE_ATTRIBUTE_TOTAL_CONSTANT_MEMORY**: Memory available on device for __constant__ variables in a CUDA C kernel in bytes;
- **CU_DEVICE_ATTRIBUTE_WARP_SIZE**: Warp size in threads;
- **CU_DEVICE_ATTRIBUTE_MAX_PITCH**: Maximum pitch in bytes allowed by the memory copy functions that involve memory regions allocated through cuMemAllocPitch();
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_WIDTH**: Maximum 1D texture width;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LINEAR_WIDTH**: Maximum width for a 1D texture bound to linear memory;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_MIPMAPPED_WIDTH**: Maximum mipmapped 1D texture width;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_WIDTH**: Maximum 2D texture width;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_HEIGHT**: Maximum 2D texture height;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_WIDTH**: Maximum width for a 2D texture bound to linear memory;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_HEIGHT**: Maximum height for a 2D texture bound to linear memory;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_PITCH**: Maximum pitch in bytes for a 2D texture bound to linear memory;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_MIPMAPPED_WIDTH**: Maximum mipmapped 2D texture width;
- **CUDEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_MIPMAPPED_HEIGHT**: Maximum mipmapped 2D texture height;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_WIDTH**: Maximum 3D texture width;
- **CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_HEIGHT**: Maximum 3D texture height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_DEPTH: Maximum 3D texture depth;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_WIDTH_ALTERNATE: Alternate maximum 3D texture width, 0 if no alternate maximum 3D texture size is supported;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_HEIGHT_ALTERNATE: Alternate maximum 3D texture height, 0 if no alternate maximum 3D texture size is supported;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE3D_DEPTH_ALTERNATE: Alternate maximum 3D texture depth, 0 if no alternate maximum 3D texture size is supported;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURECUBEMAP_WIDTH: Maximum cubemap texture width or height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LAYERED_WIDTH: Maximum 1D layered texture width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LAYERED_LAYERS: Maximum layers in a 1D layered texture;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_WIDTH: Maximum 2D layered texture width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_HEIGHT: Maximum 2D layered texture height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LAYERED_LAYERS: Maximum layers in a 2D layered texture;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURECUBEMAP_LAYERED_WIDTH: Maximum cubemap layered texture width or height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURECUBEMAP_LAYERED_LAYERS: Maximum layers in a cubemap layered texture;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE1D_WIDTH: Maximum 1D surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_WIDTH: Maximum 2D surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_HEIGHT: Maximum 2D surface height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE3D_WIDTH: Maximum 3D surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE3D_HEIGHT: Maximum 3D surface height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE3D_DEPTH: Maximum 3D surface depth;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE1D_LAYERED_WIDTH: Maximum 1D layered surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE1D_LAYERED_LAYERS: Maximum layers in a 1D layered surface;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_LAYERED_WIDTH: Maximum 2D layered surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_LAYERED_HEIGHT: Maximum 2D layered surface height;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACE2D_LAYERED_LAYERS: Maximum layers in a 2D layered surface;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_WIDTH: Maximum cubemap surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_LAYERED_WIDTH: Maximum cubemap layered surface width;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_LAYERED_LAYERS: Maximum layers in a cubemap layered surface;
CU_DEVICE_ATTRIBUTE_MAXIMUM_SURFACECUBEMAP_LAYERED_LAYERS: Maximum layers in a cubemap layered surface;
CU_DEVICE_ATTRIBUTE_MAX_REGISTERS_PER_BLOCK: Maximum number of 32-bit registers available to a thread block;
CU_DEVICE_ATTRIBUTE_CLOCK_RATE: The typical clock frequency in kilohertz;
CU_DEVICE_ATTRIBUTE_TEXTURE_ALIGNMENT: Alignment requirement; texture base addresses aligned to textureAlign bytes do not need an offset applied to texture fetches;
CU_DEVICE_ATTRIBUTE_TEXTURE_PITCH_ALIGNMENT: Pitch alignment requirement for 2D texture references bound to pitched memory;
CU_DEVICE_ATTRIBUTE_GPU_OVERLAP: 1 if the device can concurrently copy memory between host and device while executing a kernel, or 0 if not;
CU_DEVICE_ATTRIBUTE_MULTIPROCESSOR_COUNT: Number of multiprocessors on the device;
CU_DEVICE_ATTRIBUTE_KERNEL_EXEC_TIMEOUT: 1 if there is a run time limit for kernels executed on the device, or 0 if not;
CU_DEVICE_ATTRIBUTE_INTEGRATED: 1 if the device is integrated with the memory subsystem, or 0 if not;
CU_DEVICE_ATTRIBUTE_CAN_MAP_HOST_MEMORY: 1 if the device can map host memory into the CUDA address space, or 0 if not;
CU_DEVICE_ATTRIBUTE_COMPUTE_MODE: Compute mode that device is currently in. Available modes are as follows:
  - CU_COMPUTEMODE_DEFAULT: Default mode - Device is not restricted and can have multiple CUDA contexts present at a single time.
  - CU_COMPUTEMODE_PROHIBITED: Compute-prohibited mode - Device is prohibited from creating new CUDA contexts.
  - CU_COMPUTEMODE_EXCLUSIVE_PROCESS: Compute-exclusive-process mode - Device can have only one context used by a single process at a time.
CU_DEVICE_ATTRIBUTE_CONCURRENT_KERNELS: 1 if the device supports executing multiple kernels within the same context simultaneously, or 0 if not. It is not guaranteed that multiple kernels will be resident on the device concurrently so this feature should not be relied upon for correctness;

CU_DEVICE_ATTRIBUTE_ECC_ENABLED: 1 if error correction is enabled on the device, 0 if error correction is disabled or not supported by the device;

CU_DEVICE_ATTRIBUTE_PCI_BUS_ID: PCI bus identifier of the device;

CU_DEVICE_ATTRIBUTE_PCI_DEVICE_ID: PCI device (also known as slot) identifier of the device;

CU_DEVICE_ATTRIBUTE_PCI_DOMAIN_ID: PCI domain identifier of the device;

CU_DEVICE_ATTRIBUTE_TCC_DRIVER: 1 if the device is using a TCC driver. TCC is only available on Tesla hardware running Windows Vista or later;

CU_DEVICE_ATTRIBUTE_MEMORY_CLOCK_RATE: Peak memory clock frequency in kilohertz;

CU_DEVICE_ATTRIBUTE_GLOBAL_MEMORY_BUS_WIDTH: Global memory bus width in bits;

CU_DEVICE_ATTRIBUTE_L2_CACHE_SIZE: Size of L2 cache in bytes. 0 if the device doesn’t have L2 cache;

CU_DEVICE_ATTRIBUTE_MAX_THREADS_PER_MULTIPROCESSOR: Maximum resident threads per multiprocessor;

CU_DEVICE_ATTRIBUTE_UNIFIED_ADDRESSING: 1 if the device shares a unified address space with the host, or 0 if not;

CU_DEVICE_ATTRIBUTE_COMPUTE_CAPABILITY_MAJOR: Major compute capability version number;

CU_DEVICE_ATTRIBUTE_COMPUTE_CAPABILITY_MINOR: Minor compute capability version number;

CU_DEVICE_ATTRIBUTE_GLOBAL_L1_CACHE_SUPPORTED: 1 if device supports caching globals in L1 cache, 0 if caching globals in L1 cache is not supported by the device;

CU_DEVICE_ATTRIBUTE_LOCAL_L1_CACHE_SUPPORTED: 1 if device supports caching locals in L1 cache, 0 if caching locals in L1 cache is not supported by the device;

CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_MULTIPROCESSOR: Maximum amount of shared memory available to a multiprocessor in bytes; this amount is shared by all thread blocks simultaneously resident on a multiprocessor;

CU_DEVICE_ATTRIBUTE_MAX_REGISTERS_PER_MULTIPROCESSOR: Maximum number of 32-bit registers available to a multiprocessor; this number is shared by all thread blocks simultaneously resident on a multiprocessor;

CU_DEVICE_ATTRIBUTE_MANAGED_MEMORY: 1 if device supports allocating managed memory on this system, 0 if allocating managed memory is not supported by the device on this system.
- **CU_DEVICE_ATTRIBUTE_MULTI_GPU_BOARD**: 1 if device is on a multi-GPU board, 0 if not.
- **CU_DEVICE_ATTRIBUTE_MULTI_GPU_BOARD_GROUP_ID**: Unique identifier for a group of devices associated with the same board. Devices on the same multi-GPU board will share the same identifier.
- **CU_DEVICE_ATTRIBUTE_HOST_NATIVE_ATOMIC_SUPPORTED**: 1 if Link between the device and the host supports native atomic operations.
- **CU_DEVICE_ATTRIBUTE_SINGLE_TO_DOUBLE_PRECISION_PERF_RATIO**: Ratio of single precision performance (in floating-point operations per second) to double precision performance.
- **CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS**: Device supports coherently accessing pageable memory without calling cudaHostRegister on it.
- **CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS**: Device can coherently access managed memory concurrently with the CPU.
- **CU_DEVICE_ATTRIBUTE_COMPUTE_PREEMPTION_SUPPORTED**: Device supports Compute Preemption.
- **CU_DEVICE_ATTRIBUTE_CAN_USE_HOST_POINTER_FOR_REGISTERED_MEM**: Device can access host registered memory at the same virtual address as the CPU.
- **CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_BLOCK_OPTIN**: The maximum per block shared memory supported on this device. This is the maximum value that can be opted into when using the cuFuncSetAttribute() call. For more details see **CU_FUNC_ATTRIBUTE_MAX_DYNAMIC_SHARED_SIZE_BYTES**.
- **CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS_USES_HOST_PAGE_TABLES**: Device accesses pageable memory via the host's page tables.
- **CU_DEVICE_ATTRIBUTE_DIRECT_MANAGED_MEM_ACCESS_FROM_HOST**: The host can directly access managed memory on the device without migration.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuDeviceGetCount, cuDeviceGetName, cuDeviceGetUuid, cuDeviceGet, cuDeviceTotalMem, cudaDeviceGetAttribute, cudaGetDeviceProperties
CUresult cuDeviceGetCount (int *count)
Returns the number of compute-capable devices.

Parameters

count
- Returned number of compute-capable devices

Returns
CUDASUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Returns in *count the number of devices with compute capability greater than or equal
to 2.0 that are available for execution. If there is no such device, cuDeviceGetCount()
returns 0.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuDeviceGetAttribute, cuDeviceGetName, cuDeviceGetUuid, cuDeviceGetLuid,
cuDeviceGet, cuDeviceTotalMem, cudaGetDeviceCount

CUresult cuDeviceGetLuid (char *luid, unsigned int
*deviceNodeMask, CUdevice dev)
Return an LUID and device node mask for the device.

Parameters

luid
- Returned LUID
deviceNodeMask
- Returned device node mask
dev
- Device to get identifier string for
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_INVALID_DEVICE

Description

Return identifying information (luid and deviceNodeMask) to allow matching device
with graphics APIs.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuDeviceGetAttribute, cuDeviceGetCount, cuDeviceGetName, cuDeviceGet,
cuDeviceTotalMem, cudaGetDeviceProperties

CUresult cuDeviceGetName (char *name, int len, 
CUdevice dev)

Returns an identifier string for the device.

Parameters

name
  - Returned identifier string for the device
len
  - Maximum length of string to store in name
dev
  - Device to get identifier string for

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description

Returns an ASCII string identifying the device dev in the NULL-terminated string
pointed to by name. len specifies the maximum length of the string that may be
returned.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuDeviceGetAttribute, cuDeviceGetUuid, cuDeviceGetLuid, cuDeviceGetCount, cuDeviceGet, cuDeviceTotalMem, cudaGetDeviceProperties

CUresult cuDeviceGetUuid (CUuuid *uuid, CUdevice dev)

Return an UUID for the device.

Parameters

uuid
- Returned UUID
dev
- Device to get identifier string for

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description

Returns 16-octets identifying the device dev in the structure pointed by the uuid.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuDeviceGetAttribute, cuDeviceGetCount, cuDeviceGetName, cuDeviceGetLuid, cuDeviceGet, cuDeviceTotalMem, cudaGetDeviceProperties
CUresult cuDeviceTotalMem (size_t *bytes, CUdevice dev)
Returns the total amount of memory on the device.

Parameters
bytes
- Returned memory available on device in bytes
dev
- Device handle

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description
Returns in *bytes the total amount of memory available on the device dev in bytes.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuDeviceGetAttribute, cuDeviceGetCount, cuDeviceGetName, cuDeviceGetUuid,
cuDeviceGet, cudaMemGetInfo

5.6. Device Management [DEPRECATED]
This section describes the device management functions of the low-level CUDA driver
application programming interface.
CUresult cuDeviceComputeCapability (int *major, int *minor, CUdevice dev)

Returns the compute capability of the device.

**Parameters**

- **major**
  - Major revision number
- **minor**
  - Minor revision number
- **dev**
  - Device handle

**Returns**

- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

**Description**

*Deprecated*

This function was deprecated as of CUDA 5.0 and its functionality superceded by `cuDeviceGetAttribute()`.

Returns in `*major` and `*minor` the major and minor revision numbers that define the compute capability of the device `dev`.

Note that this function may also return error codes from previous, asynchronous launches.

**See also:**

cuDeviceGetAttribute, cuDeviceGetCount, cuDeviceGetName, cuDeviceGetUuid, cuDeviceGet, cuDeviceTotalMem
CUresult cuDeviceGetProperties (CUdevprop *prop, CUdevice dev)

Returns properties for a selected device.

Parameters

prop
- Returned properties of device
dev
- Device to get properties for

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description

 Deprecated

This function was deprecated as of CUDA 5.0 and replaced by cuDeviceGetAttribute().

Returns in *prop the properties of device dev. The CUdevprop structure is defined as:

```c
typedef struct CUdevprop_st {
    int maxThreadsPerBlock;
    int maxThreadsDim[3];
    int maxGridSize[3];
    int sharedMemPerBlock;
    int totalConstantMemory;
    int SIMDWidth;
    int memPitch;
    int regsPerBlock;
    int clockRate;
    int textureAlign
} CUdevprop;
```

where:

- maxThreadsPerBlock is the maximum number of threads per block;
- maxThreadsDim[3] is the maximum sizes of each dimension of a block;
- maxGridSize[3] is the maximum sizes of each dimension of a grid;
- sharedMemPerBlock is the total amount of shared memory available per block in bytes;
- totalConstantMemory is the total amount of constant memory available on the device in bytes;
- SIMDWidth is the warp size;
- memPitch is the maximum pitch allowed by the memory copy functions that involve memory regions allocated through cuMemAllocPitch();
- regsPerBlock is the total number of registers available per block;
- clockRate is the clock frequency in kilohertz;
- textureAlign is the alignment requirement; texture base addresses that are aligned to textureAlign bytes do not need an offset applied to texture fetches.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuDeviceGetAttribute, cuDeviceGetCount, cuDeviceGetName, cuDeviceGetUuid, cuDeviceGet, cuDeviceTotalMem

5.7. Primary Context Management

This section describes the primary context management functions of the low-level CUDA driver application programming interface.

The primary context is unique per device and shared with the CUDA runtime API. These functions allow integration with other libraries using CUDA.

CUresult cuDevicePrimaryCtxGetState (CUdevice dev, unsigned int *flags, int *active)

Get the state of the primary context.

Parameters

dev
- Device to get primary context flags for
flags
- Pointer to store flags
active
- Pointer to store context state; 0 = inactive, 1 = active

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_DEVICE,
CUDA_ERROR_INVALID_VALUE,
Description

Returns in `*flags` the flags for the primary context of `dev`, and in `*active` whether it is active. See `cuDevicePrimaryCtxSetFlags` for flag values.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
`cuDevicePrimaryCtxSetFlags, cuCtxGetFlags, cudaGetDeviceFlags`

**CUresult cuDevicePrimaryCtxRelease (CUdevice dev)**

Release the primary context on the GPU.

**Parameters**

- `dev` - Device which primary context is released

**Returns**

- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_DEVICE`

**Description**

Releases the primary context interop on the device by decreasing the usage count by 1. If the usage drops to 0 the primary context of device `dev` will be destroyed regardless of how many threads it is current to.

Please note that unlike `cuCtxDestroy()` this method does not pop the context from stack in any circumstances.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
`cuDevicePrimaryCtxRetain, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize`
CUresult cuDevicePrimaryCtxReset (CUdevice dev)
Destroy all allocations and reset all state on the primary context.

Parameters

dev
- Device for which primary context is destroyed

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_DEVICE,
CUDA_ERROR_PRIMARY_CONTEXT_ACTIVE

Description

Explicitly destroys and cleans up all resources associated with the current device in the current process.

Note that it is responsibility of the calling function to ensure that no other module in the process is using the device any more. For that reason it is recommended to use cuDevicePrimaryCtxRelease() in most cases. However it is safe for other modules to call cuDevicePrimaryCtxReset() even after resetting the device.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuDevicePrimaryCtxRetain, cuDevicePrimaryCtxRelease, cuCtxGetApiVersion,
cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit,
cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit,
cuCtxSynchronize, cudaDeviceReset

CUresult cuDevicePrimaryCtxRetain (CUcontext *pctx, CUdevice dev)
Retain the primary context on the GPU.

Parameters

pctx
- Returned context handle of the new context
CUDA.result cuDevicePrimaryCtxSetFlags (CUdevice dev, unsigned int flags)

Set flags for the primary context.

Parameters

dev
- Device for which the primary context flags are set

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_DEVICE, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Retains the primary context on the device, creating it if necessary, increasing its usage count. The caller must call cuDevicePrimaryCtxRelease() when done using the context. Unlike cuCtxCreate() the newly created context is not pushed onto the stack.

Context creation will fail with CUDA_ERROR_UNKNOWN if the compute mode of the device is CU_COMPUTEMODE_PROHIBITED. The function cuDeviceGetAttribute() can be used with CU_DEVICE_ATTRIBUTE_COMPUTE_MODE to determine the compute mode of the device. The nvidia-smi tool can be used to set the compute mode for devices. Documentation for nvidia-smi can be obtained by passing a -h option to it.

Please note that the primary context always supports pinned allocations. Other flags can be specified by cuDevicePrimaryCtxSetFlags().

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuDevicePrimaryCtxRelease, cuDevicePrimaryCtxSetFlags, cuCtxCreate, 
cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, 
cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, 
cuCtxSetLimit, cuCtxSynchronize
flags
- New flags for the device

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_DEVICE,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_PRIMARY_CONTEXT_ACTIVE

Description
Sets the flags for the primary context on the device overwriting perviously set ones. If
the primary context is already created CUDA_ERROR_PRIMARY_CONTEXT_ACTIVE
is returned.

The three LSBs of the flags parameter can be used to control how the OS thread, which
owns the CUDA context at the time of an API call, interacts with the OS scheduler when
waiting for results from the GPU. Only one of the scheduling flags can be set when
creating a context.

- **CU_CTX_SCHED_SPIN**: Instruct CUDA to actively spin when waiting for results
  from the GPU. This can decrease latency when waiting for the GPU, but may lower
  the performance of CPU threads if they are performing work in parallel with the
  CUDA thread.

- **CU_CTX_SCHED_YIELD**: Instruct CUDA to yield its thread when waiting for
  results from the GPU. This can increase latency when waiting for the GPU, but can
  increase the performance of CPU threads performing work in parallel with the GPU.

- **CU_CTX_SCHED_BLOCKING_SYNC**: Instruct CUDA to block the CPU thread on a
  synchronization primitive when waiting for the GPU to finish work.

- **CU_CTX_BLOCKING_SYNC**: Instruct CUDA to block the CPU thread on a
  synchronization primitive when waiting for the GPU to finish work.

  **Deprecated**: This flag was deprecated as of CUDA 4.0 and was replaced with
  CU_CTX_SCHED_BLOCKING_SYNC.

- **CU_CTX_SCHED_AUTO**: The default value if the flags parameter is zero, uses
  a heuristic based on the number of active CUDA contexts in the process C and
  the number of logical processors in the system P. If C > P, then CUDA will yield to
  other OS threads when waiting for the GPU (CU_CTX_SCHED_YIELD), otherwise
  CUDA will not yield while waiting for results and actively spin on the processor
  (CU_CTX_SCHED_SPIN). Additionally, on Tegra devices, CU_CTX_SCHED_AUTO
  uses a heuristic based on the power profile of the platform and may choose
  CU_CTX_SCHED_BLOCKING_SYNC for low-powered devices.

- **CU_CTX_LMEM_RESIZE_TO_MAX**: Instruct CUDA to not reduce local memory
  after resizing local memory for a kernel. This can prevent thrashing by local memory
allocations when launching many kernels with high local memory usage at the cost of potentially increased memory usage.

Note that this function may also return error codes from previous, asynchronous launches.

cuDevicePrimaryCtxRetain, cuDevicePrimaryCtxGetState, cuCtxCreate, cuCtxGetFlags, cudaSetDeviceFlags

5.8. Context Management

This section describes the context management functions of the low-level CUDA driver application programming interface.

Please note that some functions are described in Primary Context Management section.

CUresult cuCtxCreate (CUcontext *pctx, unsigned int flags, CUdevice dev)

Create a CUDA context.

Parameters

pctx
  - Returned context handle of the new context
flags
  - Context creation flags
dev
  - Device to create context on

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_DEVICE, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

In most cases it is recommended to use cuDevicePrimaryCtxRetain.
Creates a new CUDA context and associates it with the calling thread. The flags parameter is described below. The context is created with a usage count of 1 and the caller of cuCtxCreate() must call cuCtxDestroy() or when done using the context. If a context is already current to the thread, it is supplanted by the newly created context and may be restored by a subsequent call to cuCtxPopCurrent().

The three LSBs of the flags parameter can be used to control how the OS thread, which owns the CUDA context at the time of an API call, interacts with the OS scheduler when waiting for results from the GPU. Only one of the scheduling flags can be set when creating a context.

- **CU_CTX_SCHED_SPIN**: Instruct CUDA to actively spin when waiting for results from the GPU. This can decrease latency when waiting for the GPU, but may lower the performance of CPU threads if they are performing work in parallel with the CUDA thread.

- **CU_CTX_SCHED_YIELD**: Instruct CUDA to yield its thread when waiting for results from the GPU. This can increase latency when waiting for the GPU, but can increase the performance of CPU threads performing work in parallel with the GPU.

- **CU_CTX_SCHED_BLOCKING_SYNC**: Instruct CUDA to block the CPU thread on a synchronization primitive when waiting for the GPU to finish work.

- **CU_CTX_BLOCKING_SYNC**: Instruct CUDA to block the CPU thread on a synchronization primitive when waiting for the GPU to finish work.

**Deprecated**: This flag was deprecated as of CUDA 4.0 and was replaced with **CU_CTX_SCHED_BLOCKING_SYNC**.

- **CU_CTX_SCHED_AUTO**: The default value if the flags parameter is zero, uses a heuristic based on the number of active CUDA contexts in the process C and the number of logical processors in the system P. If C > P, then CUDA will yield to other OS threads when waiting for the GPU (**CU_CTX_SCHED_YIELD**), otherwise CUDA will not yield while waiting for results and actively spin on the processor (**CU_CTX_SCHED_SPIN**). Additionally, on Tegra devices, **CU_CTX_SCHED_AUTO** uses a heuristic based on the power profile of the platform and may choose **CU_CTX_SCHED_BLOCKING_SYNC** for low-powered devices.

- **CU_CTX_MAP_HOST**: Instruct CUDA to support mapped pinned allocations. This flag must be set in order to allocate pinned host memory that is accessible to the GPU.

- **CU_CTX_LMEM_RESIZE_TO_MAX**: Instruct CUDA to not reduce local memory after resizing local memory for a kernel. This can prevent thrashing by local memory allocations when launching many kernels with high local memory usage at the cost of potentially increased memory usage.

Context creation will fail with **CUDA_ERROR_UNKNOWN** if the compute mode of the device is **CU_COMPUTEMODE_PROHIBITED**. The function cuDeviceGetAttribute()
can be used with `CU_DEVICE_ATTRIBUTE_COMPUTE_MODE` to determine the compute mode of the device. The nvidia-smi tool can be used to set the compute mode for * devices. Documentation for nvidia-smi can be obtained by passing a `-h` option to it.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize

**CUresult cuCtxDestroy (CUcontext ctx)**

Destroy a CUDA context.

**Parameters**

- **ctx**
  - Context to destroy

**Returns**

- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_VALUE`

**Description**

Destroys the CUDA context specified by `ctx`. The context `ctx` will be destroyed regardless of how many threads it is current to. It is the responsibility of the calling function to ensure that no API call issues using `ctx` while `cuCtxDestroy()` is executing.

If `ctx` is current to the calling thread then `ctx` will also be popped from the current thread’s context stack (as though `cuCtxPopCurrent()` were called). If `ctx` is current to other threads, then `ctx` will remain current to those threads, and attempting to access `ctx` from those threads will result in the error `CUDA_ERROR_CONTEXT_IS_DESTROYED`.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
CUresult cuCtxGetApiVersion (CUcontext ctx, unsigned int *version)

Gets the context’s API version.

**Parameters**

- **ctx**
  - Context to check
- **version**
  - Pointer to version

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_UNKNOWN

**Description**

Returns a version number in version corresponding to the capabilities of the context (e.g. 3010 or 3020), which library developers can use to direct callers to a specific API version. If ctx is NULL, returns the API version used to create the currently bound context.

Note that new API versions are only introduced when context capabilities are changed that break binary compatibility, so the API version and driver version may be different. For example, it is valid for the API version to be 3020 while the driver version is 4020.

Note that this function may also return error codes from previous, asynchronous launches.

**See also:**

cuCtxCreate, cuCtxDestroy, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize
CUresult cuCtxGetCacheConfig (CUfunc_cache *pconfig)

Returns the preferred cache configuration for the current context.

Parameters

pconfig
- Returned cache configuration

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

On devices where the L1 cache and shared memory use the same hardware resources,
this function returns through pconfig the preferred cache configuration for the current
context. This is only a preference. The driver will use the requested configuration if
possible, but it is free to choose a different configuration if required to execute functions.

This will return a pconfig of CU_FUNC_CACHE_PREFER_NONE on devices where
the size of the L1 cache and shared memory are fixed.

The supported cache configurations are:

- CU_FUNC_CACHE_PREFER_NONE: no preference for shared memory or L1
  (default)
- CU_FUNC_CACHE_PREFER_SHARED: prefer larger shared memory and smaller
  L1 cache
- CU_FUNC_CACHE_PREFER_L1: prefer larger L1 cache and smaller shared
  memory
- CU_FUNC_CACHE_PREFER_EQUAL: prefer equal sized L1 cache and shared
  memory

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetDevice, cuCtxGetFlags,
cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig,
cuCtxSetLimit, cuCtxSynchronize, cuFuncSetCacheConfig, cudaDeviceGetCacheConfig
CUresult cuCtxGetCurrent (CUcontext *pctx)
Returns the CUDA context bound to the calling CPU thread.

Parameters
pctx
- Returned context handle

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED,

Description
Returns in *pctx the CUDA context bound to the calling CPU thread. If no context is bound to the calling CPU thread then *pctx is set to NULL and CUDA_SUCCESS is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxSetCurrent, cuCtxCreate, cuCtxDestroy, cudaGetDevice

CUresult cuCtxGetDevice (CUdevice *device)
Returns the device ID for the current context.

Parameters
device
- Returned device ID for the current context

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE,

Description
Returns in *device the ordinal of the current context's device.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSyncronize, cudaGetDevice

CUresult cuCtxGetFlags (unsigned int *flags)
Returns the flags for the current context.

Parameters
flags
   - Pointer to store flags of current context

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE,

Description
Returns in *flags the flags of the current context. See cuCtxCreate for flag values.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetCurrent,
cuCtxGetDevice cuCtxGetLimit, cuCtxGetSharedMemConfig,
cuCtxGetStreamPriorityRange, cudaGetDeviceFlags

CUresult cuCtxGetLimit (size_t *pvalue, CUlimit limit)
Returns resource limits.

Parameters
pvalue
   - Returned size of limit
limit
   - Limit to query

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_UNSUPPORTED_LIMIT

Description
Returns in *pvalue the current size of limit. The supported CULimit values are:

- CU_LIMIT_STACK_SIZE: stack size in bytes of each GPU thread.
- CU_LIMIT_PRINTF_FIFO_SIZE: size in bytes of the FIFO used by the printf() device system call.
- CU_LIMIT_MALLOC_HEAP_SIZE: size in bytes of the heap used by the malloc() and free() device system calls.
- CU_LIMIT_DEV_RUNTIME_SYNC_DEPTH: maximum grid depth at which a thread can issue the device runtime call cudaDeviceSynchronize() to wait on child grid launches to complete.
- CU_LIMIT_DEV_RUNTIME_PENDING_LAUNCH_COUNT: maximum number of outstanding device runtime launches that can be made from this context.
- CU_LIMIT_MAX_L2_FETCH_GRANULARITY: L2 cache fetch granularity.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize, cudaDeviceGetLimit

CUresult cuCtxGetSharedMemConfig (CUsharedconfig *pConfig)
Returns the current shared memory configuration for the current context.

Parameters
pConfig
   - returned shared memory configuration
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
This function will return in pConfig the current size of shared memory banks in the current context. On devices with configurable shared memory banks, cuCtxSetSharedMemConfig can be used to change this setting, so that all subsequent kernel launches will by default use the new bank size. When cuCtxGetSharedMemConfig is called on devices without configurable shared memory, it will return the fixed bank size of the hardware.

The returned bank configurations can be either:

- CU_SHARED_MEM_CONFIG_FOUR_BYTE_BANK_SIZE: shared memory bank width is four bytes.
- CU_SHARED_MEM_CONFIG_EIGHT_BYTE_BANK_SIZE: shared memory bank width will eight bytes.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig,
cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent,
cuCtxSetLimit, cuCtxSynchronize, cuCtxGetSharedMemConfig, cuFuncSetCacheConfig,
cudaDeviceGetSharedMemConfig

CResult cuCtxGetStreamPriorityRange (int *leastPriority, int *greatestPriority)
Returns numerical values that correspond to the least and greatest stream priorities.

Parameters
leastPriority
- Pointer to an int in which the numerical value for least stream priority is returned

greatestPriority
- Pointer to an int in which the numerical value for greatest stream priority is returned
Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,

Description

Returns in *leastPriority and *greatestPriority the numerical values that correspond to the least and greatest stream priorities respectively. Stream priorities follow a convention where lower numbers imply greater priorities. The range of meaningful stream priorities is given by [*greatestPriority, *leastPriority]. If the user attempts to create a stream with a priority value that is outside the meaningful range as specified by this API, the priority is automatically clamped down or up to either *leastPriority or *greatestPriority respectively. See cuStreamCreateWithPriority for details on creating a priority stream. A NULL may be passed in for *leastPriority or *greatestPriority if the value is not desired.

This function will return '0' in both *leastPriority and *greatestPriority if the current context's device does not support stream priorities (see cuDeviceGetAttribute).

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuStreamCreateWithPriority, cuStreamGetPriority, cuCtxGetDevice, cuCtxGetFlags, cuCtxSetLimit, cuCtxSynchronize, cudaDeviceGetStreamPriorityRange

CUresult cuCtxPopCurrent (CUcontext *pctx)
Pops the current CUDA context from the current CPU thread.

Parameters

pctx
- Returned new context handle

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT

Description

Pops the current CUDA context from the CPU thread and passes back the old context handle in *pctx. That context may then be made current to a different CPU thread by calling cuCtxPushCurrent().
If a context was current to the CPU thread before cuCtxCreate() or cuCtxPushCurrent() was called, this function makes that context current to the CPU thread again.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize

CUresult cuCtxPushCurrent (CUcontext ctx)
Pushes a context on the current CPU thread.

Parameters
ctx
  - Context to push

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Pushes the given context ctx onto the CPU thread’s stack of current contexts. The specified context becomes the CPU thread’s current context, so all CUDA functions that operate on the current context are affected.

The previous current context may be made current again by calling cuCtxDestroy() or cuCtxPopCurrent().

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize
CUresult cuCtxSetCacheConfig (CUfunc_cache config)

Sets the preferred cache configuration for the current context.

Parameters

config
- Requested cache configuration

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

On devices where the L1 cache and shared memory use the same hardware resources, this sets through config the preferred cache configuration for the current context. This is only a preference. The driver will use the requested configuration if possible, but it is free to choose a different configuration if required to execute the function. Any function preference set via cuFuncSetCacheConfig() will be preferred over this context-wide setting. Setting the context-wide cache configuration to CU_FUNC_CACHE_PREFER_NONE will cause subsequent kernel launches to prefer to not change the cache configuration unless required to launch the kernel.

This setting does nothing on devices where the size of the L1 cache and shared memory are fixed.

Launching a kernel with a different preference than the most recent preference setting may insert a device-side synchronization point.

The supported cache configurations are:

- CU_FUNC_CACHE_PREFER_NONE: no preference for shared memory or L1 (default)
- CU_FUNC_CACHE_PREFER_SHARED: prefer larger shared memory and smaller L1 cache
- CU_FUNC_CACHE_PREFER_L1: prefer larger L1 cache and smaller shared memory
- CU_FUNC_CACHE_PREFER_EQUAL: prefer equal sized L1 cache and shared memory

Note that this function may also return error codes from previous, asynchronous launches.
See also:

cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig,
cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent,
cuCtxSetLimit, cuCtxSynchronize, cuFuncSetCacheConfig, cudaDeviceSetCacheConfig

CUresult cuCtxGetCurrent (CUcontext ctx)
Binds the specified CUDA context to the calling CPU thread.

Parameters

ctx
- Context to bind to the calling CPU thread

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT

Description
Binds the specified CUDA context to the calling CPU thread. If ctx is NULL then
the CUDA context previously bound to the calling CPU thread is unbound and
CUDA_SUCCESS is returned.

If there exists a CUDA context stack on the calling CPU thread, this will replace the top
of that stack with ctx. If ctx is NULL then this will be equivalent to popping the top
of the calling CPU thread’s CUDA context stack (or a no-op if the calling CPU thread’s
CUDA context stack is empty).

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuCtxGetCurrent, cuCtxCreate, cuCtxDestroy, cudaSetDevice

CUresult cuCtxSetLimit (CUlimit limit, size_t value)
Set resource limits.

Parameters

limit
- Limit to set

www.nvidia.com
CUDA Driver API

TRM-06703-001 _vRelease Version | 84
value
- Size of limit

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_UNSUPPORTED_LIMIT, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_INVALID_CONTEXT

Description
Setting limit to value is a request by the application to update the current limit maintained by the context. The driver is free to modify the requested value to meet h/w requirements (this could be clamping to minimum or maximum values, rounding up to nearest element size, etc). The application can use cuCtxGetLimit() to find out exactly what the limit has been set to.

Setting each CUlimit has its own specific restrictions, so each is discussed here.

‣ CU_LIMIT_STACK_SIZE controls the stack size in bytes of each GPU thread. Note that the CUDA driver will set the limit to the maximum of value and what the kernel function requires.

‣ CU_LIMIT_PRINTF_FIFO_SIZE controls the size in bytes of the FIFO used by the printf() device system call. Setting CU_LIMIT_PRINTF_FIFO_SIZE must be performed before launching any kernel that uses the printf() device system call, otherwise CUDA_ERROR_INVALID_VALUE will be returned.

‣ CU_LIMIT_MALLOC_HEAP_SIZE controls the size in bytes of the heap used by the malloc() and free() device system calls. Setting CU_LIMIT_MALLOC_HEAP_SIZE must be performed before launching any kernel that uses the malloc() or free() device system calls, otherwise CUDA_ERROR_INVALID_VALUE will be returned.

‣ CU_LIMIT_DEV_RUNTIME_SYNC_DEPTH controls the maximum nesting depth of a grid at which a thread can safely call cudaDeviceSynchronize(). Setting this limit must be performed before any launch of a kernel that uses the device runtime and calls cudaDeviceSynchronize() above the default sync depth, two levels of grids. Calls to cudaDeviceSynchronize() will fail with error code cudaErrorSyncDepthExceeded if the limitation is violated. This limit can be set smaller than the default or up the maximum launch depth of 24. When setting this limit, keep in mind that additional levels of sync depth require the driver to reserve large amounts of device memory which can no longer be used for user allocations. If these reservations of device memory fail, cuCtxSetLimit will return CUDA_ERROR_OUT_OF_MEMORY, and the limit can be reset to a lower value. This limit is only applicable to devices of compute capability 3.5 and higher. Attempting to set this limit on devices of compute capability less than 3.5 will result in the error CUDA_ERROR_UNSUPPORTED_LIMIT being returned.
CU_LIMIT_DEV_RUNTIME_PENDING_LAUNCH_COUNT controls the maximum number of outstanding device runtime launches that can be made from the current context. A grid is outstanding from the point of launch up until the grid is known to have been completed. Device runtime launches which violate this limitation fail and return cudaErrorLaunchPendingCountExceeded when cudaGetLastError() is called after launch. If more pending launches than the default (2048 launches) are needed for a module using the device runtime, this limit can be increased. Keep in mind that being able to sustain additional pending launches will require the driver to reserve larger amounts of device memory upfront which can no longer be used for allocations. If these reservations fail, cuCtxSetLimit will return CUDA_ERROR_OUT_OF_MEMORY, and the limit can be reset to a lower value. This limit is only applicable to devices of compute capability 3.5 and higher. Attempting to set this limit on devices of compute capability less than 3.5 will result in the error CUDA_ERROR_UNSUPPORTED_LIMIT being returned.

CU_LIMIT_MAX_L2_FETCH_GRANULARITY controls the L2 cache fetch granularity. Values can range from 0B to 128B. This is purely a performance hint and it can be ignored or clamped depending on the platform.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSynchronize, cudaDeviceSetLimit

CUresult cuCtxSetSharedMemConfig (CUsharedconfig config)
Sets the shared memory configuration for the current context.

Parameters

config
- requested shared memory configuration

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE
Description

On devices with configurable shared memory banks, this function will set the context’s shared memory bank size which is used for subsequent kernel launches.

Changed the shared memory configuration between launches may insert a device side synchronization point between those launches.

Changing the shared memory bank size will not increase shared memory usage or affect occupancy of kernels, but may have major effects on performance. Larger bank sizes will allow for greater potential bandwidth to shared memory, but will change what kinds of accesses to shared memory will result in bank conflicts.

This function will do nothing on devices with fixed shared memory bank size.

The supported bank configurations are:

- **CU_SHARED_MEM_CONFIG_DEFAULT_BANK_SIZE**: set bank width to the default initial setting (currently, four bytes).
- **CU_SHARED_MEM_CONFIG_FOUR_BYTE_BANK_SIZE**: set shared memory bank width to be natively four bytes.
- **CU_SHARED_MEM_CONFIG_EIGHT_BYTE_BANK_SIZE**: set shared memory bank width to be natively eight bytes.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetLimit, cuCtxSynchronize, cuCtxGetSharedMemConfig, cuFuncSetCacheConfig, cudaDeviceSetSharedMemConfig

CUresult cuCtxSynchronize (void)

Block for a context’s tasks to complete.

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT

Description

Blocks until the device has completed all preceding requested tasks. cuCtxSynchronize() returns an error if one of the preceding tasks failed. If the context was created with the
CU_CTX_SCHED_BLOCKING_SYNC flag, the CPU thread will block until the GPU context has finished its work.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cudaDeviceSynchronize

5.9. Context Management [DEPRECATED]

This section describes the deprecated context management functions of the low-level CUDA driver application programming interface.

CUresult cuCtxAttach (CUcontext *pctx, unsigned int flags)
Increment a context's usage-count.

Parameters
pctx
  - Returned context handle of the current context
flags
  - Context attach flags (must be 0)

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Note that this function is deprecated and should not be used.

Increments the usage count of the context and passes back a context handle in *pctx that must be passed to cuCtxDetach() when the application is done with the context. cuCtxAttach() fails if there is no context current to the thread.

Currently, the flags parameter must be 0.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxCreate, cuCtxDestroy, cuCtxDetach, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize

CUresult cuCtxDetach (CUcontext ctx)
Decrement a context’s usage-count.

Parameters

ctx
- Context to destroy

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT

Description

Deprecated

Note that this function is deprecated and should not be used.

Decrement the usage count of the context ctx, and destroys the context if the usage count goes to 0. The context must be a handle that was passed back by cuCtxCreate() or cuCtxAttach(), and must be current to the calling thread.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxCreate, cuCtxDestroy, cuCtxGetApiVersion, cuCtxGetCacheConfig, cuCtxGetDevice, cuCtxGetFlags, cuCtxGetLimit, cuCtxPopCurrent, cuCtxPushCurrent, cuCtxSetCacheConfig, cuCtxSetLimit, cuCtxSynchronize
5.10. Module Management

This section describes the module management functions of the low-level CUDA driver application programming interface.

CUresult cuLinkAddData (CUlinkState state, CUjitInputType type, void *data, size_t size, const char *name, unsigned int numOptions, CUjit_option *options, void **optionValues)

Add an input to a pending linker invocation.

Parameters

state
A pending linker action.

type
The type of the input data.

data
The input data. PTX must be NULL-terminated.

size
The length of the input data.

name
An optional name for this input in log messages.

numOptions
Size of options.

options
Options to be applied only for this input (overrides options from cuLinkCreate).

optionValues
Array of option values, each cast to void *.

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_IMAGE,
CUDA_ERROR_INVALID_PTX, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_NO_BINARY_FOR_GPU

Description

Ownership of data is retained by the caller. No reference is retained to any inputs after this call returns.
This method accepts only compiler options, which are used if the data must be compiled from PTX, and does not accept any of \texttt{CU\_JIT\_WALL\_TIME}, \texttt{CU\_JIT\_INFO\_LOG\_BUFFER}, \texttt{CU\_JIT\_ERROR\_LOG\_BUFFER}, \texttt{CU\_JIT\_TARGET\_FROM\_CUCONTEXT}, or \texttt{CU\_JIT\_TARGET}.

See also:
\texttt{cuLinkCreate}, \texttt{cuLinkAddFile}, \texttt{cuLinkComplete}, \texttt{cuLinkDestroy}

\begin{verbatim}
CUresult cuLinkAddFile (CUlinkState state,
                        CUjitInputType type, const char *path,
                        unsigned int numOptions, CUjit_option *options,
                        void **optionValues)
\end{verbatim}

Add a file input to a pending linker invocation.

\textbf{Parameters}

\begin{description}
\item[state] A pending linker action
\item[type] The type of the input data
\item[path] Path to the input file
\item[numOptions] Size of options
\item[options] Options to be applied only for this input (overrides options from \texttt{cuLinkCreate})
\item[optionValues] Array of option values, each cast to \texttt{void *}
\end{description}

\textbf{Returns}

\begin{verbatim}
CUDA\_SUCCESS, CUDA\_ERROR\_FILE\_NOT\_FOUND,
CUDA\_ERROR\_INVALID\_HANDLE, CUDA\_ERROR\_INVALID\_VALUE,
CUDA\_ERROR\_INVALID\_IMAGE, CUDA\_ERROR\_INVALID\_PTX,
CUDA\_ERROR\_OUT\_OF\_MEMORY, CUDA\_ERROR\_NO\_BINARY\_FOR\_GPU
\end{verbatim}

\textbf{Description}

No reference is retained to any inputs after this call returns.

This method accepts only compiler options, which are used if the input must be compiled from PTX, and does not accept any of \texttt{CU\_JIT\_WALL\_TIME}, \texttt{CU\_JIT\_INFO\_LOG\_BUFFER}, \texttt{CU\_JIT\_ERROR\_LOG\_BUFFER}, \texttt{CU\_JIT\_TARGET\_FROM\_CUCONTEXT}, or \texttt{CU\_JIT\_TARGET}.
This method is equivalent to invoking `cuLinkAddData` on the contents of the file.

See also:

`cuLinkCreate`, `cuLinkAddData`, `cuLinkComplete`, `cuLinkDestroy`

CUresult `cuLinkComplete (CUlinkState state, void **cubinOut, size_t *sizeOut)`

Complete a pending linker invocation.

Parameters

`state`
A pending linker invocation

`cubinOut`
On success, this will point to the output image

`sizeOut`
Optional parameter to receive the size of the generated image

Returns

`CUDA_SUCCESS`, `CUDA_ERROR_INVALID_HANDLE`, `CUDA_ERROR_OUT_OF_MEMORY`

Description

Completes the pending linker action and returns the cubin image for the linked device code, which can be used with `cuModuleLoadData`. The cubin is owned by `state`, so it should be loaded before `state` is destroyed via `cuLinkDestroy`. This call does not destroy `state`.

See also:

`cuLinkCreate`, `cuLinkAddData`, `cuLinkAddFile`, `cuLinkDestroy`, `cuModuleLoadData`

CUresult `cuLinkCreate (unsigned int numOptions, CUjit_option *options, void **optionValues, CUlinkState *stateOut)`

Creates a pending JIT linker invocation.

Parameters

`numOptions`
Size of options arrays
options
   Array of linker and compiler options

optionValues
   Array of option values, each cast to void *

stateOut
   On success, this will contain a CUlinkState to specify and complete this action

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_JIT_COMPILER_NOT_FOUND

Description

If the call is successful, the caller owns the returned CUlinkState, which should eventually be destroyed with cuLinkDestroy. The device code machine size (32 or 64 bit) will match the calling application.

Both linker and compiler options may be specified. Compiler options will be applied to inputs to this linker action which must be compiled from PTX. The options CU_JIT_WALL_TIME, CU_JIT_INFO_LOG_BUFFER_SIZE_BYTES, and CU_JIT_ERROR_LOG_BUFFER_SIZE_BYTES will accumulate data until the CUlinkState is destroyed.

optionValues must remain valid for the life of the CUlinkState if output options are used. No other references to inputs are maintained after this call returns.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuLinkAddData, cuLinkAddFile, cuLinkComplete, cuLinkDestroy

CUresult cuLinkDestroy (CUlinkState state)

Destroys state for a JIT linker invocation.

Parameters

state
   State object for the linker invocation
Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE

Description
See also:
cuLinkCreate

CUresult cuModuleGetFunction (CUfunction *hfunc, 
CUmodule hmod, const char *name)
Returns a function handle.

Parameters
hfunc
- Returned function handle
hmod
- Module to retrieve function from
name
- Name of function to retrieve

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, 
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, 
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND

Description
Returns in *hfunc the handle of the function of name name located in module 
hmod. If no function of that name exists, cuModuleGetFunction() returns 
CUDA_ERROR_NOT_FOUND.

Note that this function may also return error codes from previous, asynchronous 
launches.

See also:
cuModuleGetGlobal, cuModuleGetTexRef, cuModuleLoad, cuModuleLoadData, 
cuModuleLoadDataEx, cuModuleLoadFatBinary, cuModuleUnload
CUresult cuModuleGetGlobal (CUdeviceptr *dptr, size_t *bytes, CUmodule hmod, const char *name)
Returns a global pointer from a module.

Parameters

dptr
- Returned global device pointer

bytes
- Returned global size in bytes

hmod
- Module to retrieve global from

name
- Name of global to retrieve

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND

Description

Returns in *dptr and *bytes the base pointer and size of the global of name name located in module hmod. If no variable of that name exists, cuModuleGetGlobal() returns CUDA_ERROR_NOT_FOUND. Both parameters dptr and bytes are optional. If one of them is NULL, it is ignored.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuModuleGetFunction, cuModuleGetTexRef, cuModuleLoad, cuModuleLoadData,
cuModuleLoadDataEx, cuModuleLoadFatBinary, cuModuleUnload,
cudaGetSymbolAddress, cudaGetSymbolSize
CUresult cuModuleGetSurfRef (CUsurfref *pSurfRef, CUmodule hmod, const char *name)

Returns a handle to a surface reference.

Parameters
pSurfRef
- Returned surface reference
hmod
- Module to retrieve surface reference from
name
- Name of surface reference to retrieve

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND

Description
Returns in *pSurfRef the handle of the surface reference of name name in the module hmod. If no surface reference of that name exists, cuModuleGetSurfRef() returns CUDA_ERROR_NOT_FOUND.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuModuleGetFunction, cuModuleGetGlobal, cuModuleGetTexRef, cuModuleLoad, cuModuleLoadData, cuModuleLoadDataEx, cuModuleLoadFatBinary, cuModuleUnload, cudaGetSurfaceReference

CUresult cuModuleGetTexRef (CUTexref *pTexRef, CUmodule hmod, const char *name)

Returns a handle to a texture reference.

Parameters
pTexRef
- Returned texture reference
hmod
  - Module to retrieve texture reference from
name
  - Name of texture reference to retrieve

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND

Description
Returns in *pTexRef the handle of the texture reference of name name in the module
hmod. If no texture reference of that name exists, cuModuleGetTexRef() returns
CUDA_ERROR_NOT_FOUND. This texture reference handle should not be destroyed,
since it will be destroyed when the module is unloaded.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuModuleGetFunction, cuModuleGetGlobal, cuModuleGetSurfRef, cuModuleLoad,
cuModuleLoadData, cuModuleLoadDataEx, cuModuleLoadFatBinary,
cuModuleUnload, cudaGetTextureReference

CUresult cuModuleLoad (CUmodule *module, const char *fname)
Loads a compute module.

Parameters
module
  - Returned module
fname
  - Filename of module to load

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_PTX,
CUDA_ERROR_NOT_FOUND, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_FILE_NOT_FOUND, CUDA_ERROR_NO_BINARY_FOR_GPU, CUDA_ERROR_SHARED_OBJECT_SYMBOL_NOT_FOUND, CUDA_ERROR_SHARED_OBJECT_INIT_FAILED, CUDA_ERROR_JIT_COMPILER_NOT_FOUND

Description
Takes a filename `fname` and loads the corresponding module `module` into the current context. The CUDA driver API does not attempt to lazily allocate the resources needed by a module; if the memory for functions and data (constant and global) needed by the module cannot be allocated, `cuModuleLoad()` fails. The file should be a cubin file as output by `nvcc`, or a PTX file either as output by `nvcc` or handwritten, or a fatbin file as output by `nvcc` from toolchain 4.0 or later.

See also:
cuModuleGetFunction, cuModuleGetGlobal, cuModuleGetTexRef, cuModuleLoadData, cuModuleLoadDataEx, cuModuleLoadFatBinary, cuModuleUnload

```
CUresult cuModuleLoadData (CUmodule *module, const void *image)
```
Load a module’s data.

Parameters
- **module**
  - Returned module
- **image**
  - Module data to load

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_PTX, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_NO_BINARY_FOR_GPU, CUDA_ERROR_SHARED_OBJECT_SYMBOL_NOT_FOUND, CUDA_ERROR_SHARED_OBJECT_INIT_FAILED, CUDA_ERROR_JIT_COMPILER_NOT_FOUND
Description
Takes a pointer `image` and loads the corresponding module `module` into the current context. The pointer may be obtained by mapping a cubin or PTX or fatbin file, passing a cubin or PTX or fatbin file as a NULL-terminated text string, or incorporating a cubin or fatbin object into the executable resources and using operating system calls such as Windows `FindResource()` to obtain the pointer.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuModuleGetFunction, cuModuleGetGlobal, cuModuleGetTexRef, cuModuleLoad, cuModuleLoadDataEx, cuModuleLoadFatBinary, cuModuleUnload

`CUresult cuModuleLoadDataEx (CUmodule *module, const void *image, unsigned int numOptions, CUjit_option *options, void **optionValues)`
Load a module's data with options.

Parameters

`module`
- Returned module

`image`
- Module data to load

`numOptions`
- Number of options

`options`
- Options for JIT

`optionValues`
- Option values for JIT

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_PTX, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_NO_BINARY_FOR_GPU, CUDA_ERROR_SHARED_OBJECT_SYMBOL_NOT_FOUND, CUDA_ERROR_SHARED_OBJECT_INIT_FAILED, CUDA_ERROR_JIT_COMPILER_NOT_FOUND
Description

Takes a pointer `image` and loads the corresponding module `module` into the current context. The pointer may be obtained by mapping a cubin or PTX or fatbin file, passing a cubin or PTX or fatbin file as a NULL-terminated text string, or incorporating a cubin or fatbin object into the executable resources and using operating system calls such as Windows `FindResource()` to obtain the pointer. Options are passed as an array via `options` and any corresponding parameters are passed in `optionValues`. The number of total options is supplied via `numOptions`. Any outputs will be returned via `optionValues`.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuModuleGetFunction`, `cuModuleGetGlobal`, `cuModuleGetTexRef`, `cuModuleLoad`, `cuModuleLoadData`, `cuModuleLoadFatBinary`, `cuModuleUnload`

**CUresult cuModuleLoadFatBinary (CUmodule *module, const void *fatCubin)**

Load a module's data.

**Parameters**

- `module` - Returned module
- `fatCubin` - Fat binary to load

**Returns**

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_VALUE`, `CUDA_ERROR_INVALID_PTX`, `CUDA_ERROR_NOT_FOUND`, `CUDA_ERROR_OUT_OF_MEMORY`, `CUDA_ERROR_NO_BINARY_FOR_GPU`, `CUDA_ERROR/shared_object_symbol_not_found`, `CUDA_ERROR/shared_object_init_failed`, `CUDA_ERROR/JIT_COMPILER_NOT_FOUND`
Description

Takes a pointer `fatCubin` and loads the corresponding module `module` into the current context. The pointer represents a fat binary object, which is a collection of different cubin and/or PTX files, all representing the same device code, but compiled and optimized for different architectures.

Prior to CUDA 4.0, there was no documented API for constructing and using fat binary objects by programmers. Starting with CUDA 4.0, fat binary objects can be constructed by providing the `-fatbin` option to `nvcc`. More information can be found in the `nvcc` document.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuModuleGetFunction, cuModuleGetGlobal, cuModuleGetTexRef, cuModuleLoad, cuModuleLoadData, cuModuleLoadDataEx, cuModuleUnload`

**CUresult cuModuleUnload (CUmodule hmod)**

Unloads a module.

Parameters

`hmod`

- Module to unload

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Unloads a module `hmod` from the current context.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
5.11. Memory Management

This section describes the memory management functions of the low-level CUDA driver application programming interface.

CUresult cuArray3DCreate (CUarray *pHandle, const CUDA_ARRAY3D_DESCRIPTOR *pAllocateArray)

Creates a 3D CUDA array.

Parameters

pHandle
- Returned array

pAllocateArray
- 3D array descriptor

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Creates a CUDA array according to the CUDA_ARRAY3D_DESCRIPTOR structure pAllocateArray and returns a handle to the new CUDA array in *pHandle. The CUDA_ARRAY3D_DESCRIPTOR is defined as:

```c
typedef struct {
    unsigned int Width;
    unsigned int Height;
    unsigned int Depth;
    CUarray_format Format;
    unsigned int NumChannels;
    unsigned int Flags;
} CUDA_ARRAY3D_DESCRIPTOR;
```

where:

- **Width**, **Height**, and **Depth** are the width, height, and depth of the CUDA array (in elements); the following types of CUDA arrays can be allocated:
  - A 1D array is allocated if **Height** and **Depth** extents are both zero.
  - A 2D array is allocated if only **Depth** extent is zero.
- A 3D array is allocated if all three extents are non-zero.
- A 1D layered CUDA array is allocated if only Height is zero and the CUDA_ARRAY3D_LAYERED flag is set. Each layer is a 1D array. The number of layers is determined by the depth extent.
- A 2D layered CUDA array is allocated if all three extents are non-zero and the CUDA_ARRAY3D_LAYERED flag is set. Each layer is a 2D array. The number of layers is determined by the depth extent.
- A cubemap CUDA array is allocated if all three extents are non-zero and the CUDA_ARRAY3D_CUBEMAP flag is set. Width must be equal to Height, and Depth must be six. A cubemap is a special type of 2D layered CUDA array, where the six layers represent the six faces of a cube. The order of the six layers in memory is the same as that listed in CUarray_cubemap_face.
- A cubemap layered CUDA array is allocated if all three extents are non-zero, and both, CUDA_ARRAY3D_CUBEMAP and CUDA_ARRAY3D_LAYERED flags are set. Width must be equal to Height, and Depth must be a multiple of six. A cubemap layered CUDA array is a special type of 2D layered CUDA array that consists of a collection of cubemaps. The first six layers represent the first cubemap, the next six layers form the second cubemap, and so on.

- Format specifies the format of the elements; CUarray_format is defined as:

```c
typedef enum CUarray_format_enum {
    CU_AD_FORMAT_UNSIGNED_INT8 = 0x01,
    CU_AD_FORMAT_UNSIGNED_INT16 = 0x02,
    CU_AD_FORMAT_UNSIGNED_INT32 = 0x03,
    CU_AD_FORMAT_SIGNED_INT8 = 0x08,
    CU_AD_FORMAT_SIGNED_INT16 = 0x09,
    CU_AD_FORMAT_SIGNED_INT32 = 0x0a,
    CU_AD_FORMAT_HALF = 0x10,
    CU_AD_FORMAT_FLOAT = 0x20
} CUarray_format;
```

- NumChannels specifies the number of packed components per CUDA array element; it may be 1, 2, or 4;

- Flags may be set to
  - CUDA_ARRAY3D_LAYERED to enable creation of layered CUDA arrays. If this flag is set, Depth specifies the number of layers, not the depth of a 3D array.
  - CUDA_ARRAY3D_SURFACE_LDST to enable surface references to be bound to the CUDA array. If this flag is not set, cuSurfRefSetArray will fail when attempting to bind the CUDA array to a surface reference.
  - CUDA_ARRAY3D_CUBEMAP to enable creation of cubemaps. If this flag is set, Width must be equal to Height, and Depth must be six. If the CUDA_ARRAY3D_LAYERED flag is also set, then Depth must be a multiple of six.
  - CUDA_ARRAY3D_TEXTURE_GATHER to indicate that the CUDA array will be used for texture gather. Texture gather can only be performed on 2D CUDA arrays.
Width, Height and Depth must meet certain size requirements as listed in the following table. All values are specified in elements. Note that for brevity’s sake, the full name of the device attribute is not specified. For ex., TEXTURE1D_WIDTH refers to the device attribute CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_WIDTH.

Note that 2D CUDA arrays have different size requirements if the CUDA_ARRAY3D_TEXTURE_GATHER flag is set. Width and Height must not be greater than CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_GATHER_WIDTH and CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_GATHER_HEIGHT respectively, in that case.

Here are examples of CUDA array descriptions:
Description for a CUDA array of 2048 floats:
```c
CUDA_ARRAY3D_DESCRIPTOR desc;
    desc.Format = CU_AD_FORMAT_FLOAT;
    desc.NumChannels = 1;
    desc.Width = 2048;
    desc.Height = 0;
    desc.Depth = 0;
```

Description for a 64 x 64 CUDA array of floats:
```c
CUDA_ARRAY3D_DESCRIPTOR desc;
    desc.Format = CU_AD_FORMAT_FLOAT;
    desc.NumChannels = 1;
    desc.Width = 64;
    desc.Height = 64;
    desc.Depth = 0;
```

Description for a width x height x depth CUDA array of 64-bit, 4x16-bit float16's:
```c
CUDA_ARRAY3D_DESCRIPTOR desc;
    desc.FormatFlags = CU_AD_FORMAT_HALF;
    desc.NumChannels = 4;
    desc.Width = width;
    desc.Height = height;
    desc.Depth = depth;
```

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuArray3DGetDescriptor
(CUDA_ARRAY3D_DESCRIPTOR *pArrayDescriptor, CUarray hArray)
Get a 3D CUDA array descriptor.

Parameters
pArrayDescriptor
- Returned 3D array descriptor
hArray
- 3D array to get descriptor of

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_CONTEXT_IS_DESTROYED

Description

Returns in *pArrayDescriptor a descriptor containing information on the format and dimensions of the CUDA array hArray. It is useful for subroutines that have been passed a CUDA array, but need to know the CUDA array parameters for validation or other purposes.

This function may be called on 1D and 2D arrays, in which case the Height and/or Depth members of the descriptor struct will be set to 0.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuArrayCreate (CUarray *pHandle, const CUDA_ARRAY_DESCRIPTOR *pAllocateArray)

Creates a 1D or 2D CUDA array.

Parameters

pHandle
- Returned array
pAllocateArray
- Array descriptor

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description
Creates a CUDA array according to the CUDA_ARRAY_DESCRIPTOR structure pAllocateArray and returns a handle to the new CUDA array in *pHandle. The CUDA_ARRAY_DESCRIPTOR is defined as:

```
typedef struct {
    unsigned int Width;
    unsigned int Height;
    CUarray_format Format;
    unsigned int NumChannels;
} CUDA_ARRAY_DESCRIPTOR;
```

where:

- Width, and Height are the width, and height of the CUDA array (in elements); the CUDA array is one-dimensional if height is 0, two-dimensional otherwise;
- Format specifies the format of the elements; CUarray_format is defined as:

```
typedef enum CUarray_format_enum {
    CU_AD_FORMAT_UNSIGNED_INT8 = 0x01,
    CU_AD_FORMAT_UNSIGNED_INT16 = 0x02,
    CU_AD_FORMAT_UNSIGNED_INT32 = 0x03,
    CU_AD_FORMAT_SIGNED_INT8 = 0x08,
    CU_AD_FORMAT_SIGNED_INT16 = 0x09,
    CU_AD_FORMAT_SIGNED_INT32 = 0x0a,
    CU_AD_FORMAT_HALF = 0x10,
    CU_AD_FORMAT_FLOAT = 0x20
} CUarray_format;
```

- NumChannels specifies the number of packed components per CUDA array element; it may be 1, 2, or 4;

Here are examples of CUDA array descriptions:

Description for a CUDA array of 2048 floats:
```
CUDA_ARRAY_DESCRIPTOR desc;
desc.Format = CU_AD_FORMAT_FLOAT;
desc.NumChannels = 1;
desc.Width = 2048;
desc.Height = 1;
```

Description for a 64 x 64 CUDA array of floats:
```
CUDA_ARRAY_DESCRIPTOR desc;
desc.Format = CU_AD_FORMAT_FLOAT;
desc.NumChannels = 1;
desc.Width = 64;
desc.Height = 64;
```
Description for a width x height CUDA array of 64-bit, 4x16-bit float16's:

```c
CUDA_ARRAY_DESCRIPTOR desc;
    desc.FormatFlags = CU_AD_FORMAT_HALF;
    desc.NumChannels = 4;
    desc.Width = width;
    desc.Height = height;
```

Description for a width x height CUDA array of 16-bit elements, each of which is two 8-bit unsigned chars:

```c
CUDA_ARRAY_DESCRIPTOR arrayDesc;
    desc.FormatFlags = CU_AD_FORMAT_UNSIGNED_INT8;
    desc.NumChannels = 2;
    desc.Width = width;
    desc.Height = height;
```

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuArrayDestroy (CUarray hArray)

Destroys a CUDA array.

Parameters
hArray
   - Array to destroy

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ARRAY_IS_MAPPED, CUDA_ERROR_CONTEXT_IS_DESTROYED
Description
Destroys the CUDA array hArray.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuArrayGetDescriptor
(CUDA_ARRAY_DESCRIPTOR *pArrayDescriptor, CUarray hArray)
Get a 1D or 2D CUDA array descriptor.

Parameters
pArrayDescriptor
- Returned array descriptor
hArray
- Array to get descriptor of

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Returns in *pArrayDescriptor a descriptor containing information on the format and dimensions of the CUDA array hArray. It is useful for subroutines that have been passed a CUDA array, but need to know the CUDA array parameters for validation or other purposes.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuDeviceGetByPCIBusId (CUdevice *dev, const char *pciBusId)
Returns a handle to a compute device.

Parameters

dev
- Returned device handle

pciBusId
- String in one of the following forms: [domain]:[bus]:[device].[function] [domain]:[bus]:[device] [bus]:[device].[function] where domain, bus, device, and function are all hexadecimal values

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_INVALID_DEVICE

Description

Returns in *device a device handle given a PCI bus ID string.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuDeviceGet, cuDeviceGetAttribute, cuDeviceGetPCIBusId, cudaDeviceGetByPCIBusId

CUresult cuDeviceGetPCIBusId (char *pciBusId, int len, CUdevice dev)

Returns a PCI Bus Id string for the device.

Parameters

pciBusId
- Returned identifier string for the device in the following format [domain]:[bus]:
  [device]:[function] where domain, bus, device, and function are all hexadecimal
  values. pciBusId should be large enough to store 13 characters including the NULL-
  terminator.

len
- Maximum length of string to store in name

dev
- Device to get identifier string for

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_INVALID_DEVICE

Description

Returns an ASCII string identifying the device dev in the NULL-terminated string
pointed to by pciBusId. len specifies the maximum length of the string that may be
returned.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuDeviceGet, cuDeviceGetAttribute, cuDeviceGetByPCIBusId, cudaDeviceGetPCIBusId
CUresult cuIpcCloseMemHandle (CUdeviceptr dptr)
Close memory mapped with cuIpcOpenMemHandle.

Parameters

dptr
- Device pointer returned by cuIpcOpenMemHandle

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_MAP_FAILED, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE

Description

Unmaps memory returned by cuIpcOpenMemHandle. The original allocation in the exporting process as well as imported mappings in other processes will be unaffected.

Any resources used to enable peer access will be freed if this is the last mapping using them.

IPC functionality is restricted to devices with support for unified addressing on Linux and Windows operating systems. IPC functionality on Windows is restricted to GPUs in TCC mode

See also:
cuMemAlloc, cuMemFree, cuIpcGetEventHandle, cuIpcOpenEventHandle, cuIpcGetMemHandle, cuIpcOpenMemHandle, cudaIpcCloseMemHandle

CUresult cuIpcGetEventHandle (CUipcEventHandle *pHandle, CUevent event)
Gets an interprocess handle for a previously allocated event.

Parameters

pHandle
- Pointer to a user allocated CUipcEventHandle in which to return the opaque event handle

event
- Event allocated with CU_EVENT_INTERPROCESS and CU_EVENT_DISABLE_TIMING flags.
Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_MAP_FAILED,
CUDA_ERROR_INVALID_VALUE

Description
Takes as input a previously allocated event. This event must have been created
with the CU_EVENT_INTERPROCESS and CU_EVENT_DISABLE_TIMING flags
set. This opaque handle may be copied into other processes and opened with
culpcOpenEventHandle to allow efficient hardware synchronization between GPU work
in different processes.

After the event has been opened in the importing process, cuEventRecord,
cuEventSynchronize, cuStreamWaitEvent and cuEventQuery may be used in either
process. Performing operations on the imported event after the exported event has been
freed with cuEventDestroy will result in undefined behavior.

IPC functionality is restricted to devices with support for unified addressing on Linux
and Windows operating systems. IPC functionality on Windows is restricted to GPUs in
TCC mode

See also:
cuEventCreate, cuEventDestroy, cuEventSynchronize, cuEventQuery,
cuStreamWaitEvent, culpcOpenEventHandle, culpcGetMemHandle,
culpcOpenMemHandle, culpcCloseMemHandle, cudaIpcGetEventHandle

CUresult culpcGetMemHandle (CUipcMemHandle
*pHandle, C Ud eviceptr dptr)
Gets an interprocess memory handle for an existing device memory allocation.

Parameters
pHandle
- Pointer to user allocated CUipcMemHandle to return the handle in.
dptr
- Base pointer to previously allocated device memory

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_MAP_FAILED,
CUDA_ERROR_INVALID_VALUE
Description
Takes a pointer to the base of an existing device memory allocation created with `cuMemAlloc` and exports it for use in another process. This is a lightweight operation and may be called multiple times on an allocation without adverse effects.

If a region of memory is freed with `cuMemFree` and a subsequent call to `cuMemAlloc` returns memory with the same device address, `cuIpcGetMemHandle` will return a unique handle for the new memory.

IPC functionality is restricted to devices with support for unified addressing on Linux and Windows operating systems. IPC functionality on Windows is restricted to GPUs in TCC mode.

See also:
`cuMemAlloc`, `cuMemFree`, `cuIpcGetEventHandle`, `cuIpcOpenEventHandle`, `cuIpcOpenMemHandle`, `cuIpcCloseMemHandle`, `cudaIpcGetMemHandle`

`CUresult cuIpcOpenEventHandle (CUevent *phEvent, CUipcEventHandle handle)`
Opens an interprocess event handle for use in the current process.

Parameters
`phEvent`
- Returns the imported event
`handle`
- Interprocess handle to open

Returns
`CUDA_SUCCESS`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_MAP_FAILED`, `CUDA_ERROR_PEER_ACCESS_UNSUPPORTED`, `CUDA_ERROR_INVALID_HANDLE`, `CUDA_ERROR_INVALID_VALUE`

Description
Opens an interprocess event handle exported from another process with `cuIpcGetEventHandle`. This function returns a `CUevent` that behaves like a locally created event with the `CU_EVENT_DISABLE_TIMING` flag specified. This event must be freed with `cuEventDestroy`.

Performing operations on the imported event after the exported event has been freed with `cuEventDestroy` will result in undefined behavior.
IPC functionality is restricted to devices with support for unified addressing on Linux and Windows operating systems. IPC functionality on Windows is restricted to GPUs in TCC mode.

See also:

`cuEventCreate`, `cuEventDestroy`, `cuEventSynchronize`, `cuEventQuery`, `cuStreamWaitEvent`, `cuIpcGetEventHandle`, `cuIpcGetMemHandle`, `cuIpcOpenMemHandle`, `cuIpcCloseMemHandle`, `cudaIpcOpenEventHandle`

### CUresult cuIpcOpenMemHandle (CUdeviceptr *pdptr, CUipcMemHandle handle, unsigned int Flags)

Opens an interprocess memory handle exported from another process and returns a device pointer usable in the local process.

#### Parameters

- **pdptr**
  - Returned device pointer
- **handle**
  - CUipcMemHandle to open
- **Flags**
  - Flags for this operation. Must be specified as `CU_IPC_MEM_LAZY_ENABLE_PEER_ACCESS`

#### Returns

`CUDA_SUCCESS`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_MAP_FAILED`, `CUDA_ERROR_INVALID_HANDLE`, `CUDA_ERROR_TOO_MANY_PEERS`, `CUDA_ERROR_INVALID_VALUE`

#### Description

Maps memory exported from another process with `cuIpcGetMemHandle` into the current device address space. For contexts on different devices, `cuIpcOpenMemHandle` can attempt to enable peer access between the devices as if the user called `cuCtxEnablePeerAccess`. This behavior is controlled by the `CU_IPC_MEM_LAZY_ENABLE_PEER_ACCESS` flag. `cuDeviceCanAccessPeer` can determine if a mapping is possible.

`cuIpcOpenMemHandle` can open handles to devices that may not be visible in the process calling the API.

Contexts that may open CUipcMemHandles are restricted in the following way. CUipcMemHandles from each `CUdevice` in a given process may only be opened by one `CUcontext` per `CUdevice` per other process.
Memory returned from cuIpcOpenMemHandle must be freed with cuIpcCloseMemHandle.

Calling cuMemFree on an exported memory region before calling cuIpcCloseMemHandle in the importing context will result in undefined behavior.

IPC functionality is restricted to devices with support for unified addressing on Linux and Windows operating systems. IPC functionality on Windows is restricted to GPUs in TCC mode.

No guarantees are made about the address returned in *pdptr. In particular, multiple processes may not receive the same address for the same handle.

See also:

cuMemAlloc, cuMemFree, cuIpcGetEventHandle, cuIpcOpenEventHandle, cuIpcGetMemHandle, cuIpcCloseMemHandle, cuCtxEnablePeerAccess, cuDeviceCanAccessPeer, cudaIpcOpenMemHandle

CUresult cuMemAlloc (CUdeviceptr *dptr, size_t bytesize)

Allocates device memory.

Parameters

dptr
  - Returned device pointer
bytesize
  - Requested allocation size in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

Description

Allocates bytesize bytes of linear memory on the device and returns in *dptr a pointer to the allocated memory. The allocated memory is suitably aligned for any kind of variable. The memory is not cleared. If bytesize is 0, cuMemAlloc() returns CUDA_ERROR_INVALID_VALUE.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

**CUresult cuMemAllocHost (void **pp, size_t bytesize)**

Allocates page-locked host memory.

**Parameters**

**PP**
- Returned host pointer to page-locked memory

**bytesize**
- Requested allocation size in bytes

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

**Description**

Allocates bytesize bytes of host memory that is page-locked and accessible to the device. The driver tracks the virtual memory ranges allocated with this function and automatically accelerates calls to functions such as cuMemcpy(). Since the memory can be accessed directly by the device, it can be read or written with much higher bandwidth than pageable memory obtained with functions such as malloc(). Allocating excessive amounts of memory with cuMemAllocHost() may degrade system performance, since it reduces the amount of memory available to the system for paging. As a result, this function is best used sparingly to allocate staging areas for data exchange between host and device.
Note all host memory allocated using `cuMemHostAlloc()` will automatically be immediately accessible to all contexts on all devices which support unified addressing (as may be queried using `CU_DEVICE_ATTRIBUTE_UNIFIED_ADDRESSING`). The device pointer that may be used to access this host memory from those contexts is always equal to the returned host pointer `*pp`. See Unified Addressing for additional details.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

**CUresult cuMemAllocManaged (CUdeviceptr *dptr, size_t bytesize, unsigned int flags)**

Allocates memory that will be automatically managed by the Unified Memory system.

**Parameters**

- **dptr**
  - Returned device pointer
- **bytesize**
  - Requested allocation size in bytes
- **flags**
  - Must be one of `CU_MEM_ATTACH_GLOBAL` or `CU_MEM_ATTACH_HOST`

**Returns**

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_NOT_SUPPORTED`, `CUDA_ERROR_INVALID_VALUE`, `CUDA_ERROR_OUT_OF_MEMORY`
Description

Allocates `bytesize` bytes of managed memory on the device and returns a pointer to the allocated memory. If the device doesn't support allocating managed memory, CUDA_ERROR_NOT_SUPPORTED is returned.

Support for managed memory can be queried using the device attribute `CU_DEVICE_ATTRIBUTE_MANAGED_MEMORY`. The allocated memory is suitably aligned for any kind of variable. The memory is not cleared. If `bytesize` is 0, `cuMemAllocManaged` returns CUDA_ERROR_INVALID_VALUE. The pointer is valid on the CPU and on all GPUs in the system that support managed memory. All accesses to this pointer must obey the Unified Memory programming model.

`flags` specifies the default stream association for this allocation. `flags` must be one of `CU_MEM_ATTACH_GLOBAL` or `CU_MEM_ATTACH_HOST`. If `CU_MEM_ATTACH_GLOBAL` is specified, then this memory is accessible from any stream on any device. If `CU_MEM_ATTACH_HOST` is specified, then the allocation should not be accessed from devices that have a zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS`; an explicit call to `cuStreamAttachMemAsync` will be required to enable access on such devices.

If the association is later changed via `cuStreamAttachMemAsync` to a single stream, the default association as specified during `cuMemAllocManaged` is restored when that stream is destroyed. For __managed__ variables, the default association is always `CU_MEM_ATTACH_GLOBAL`. Note that destroying a stream is an asynchronous operation, and as a result, the change to default association won't happen until all work in the stream has completed.

Memory allocated with `cuMemAllocManaged` should be released with `cuMemFree`.

Device memory oversubscription is possible for GPUs that have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS`. Managed memory on such GPUs may be evicted from device memory to host memory at any time by the Unified Memory driver in order to make room for other allocations.

In a multi-GPU system where all GPUs have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS`, managed memory may not be populated when this API returns and instead may be populated on access. In such systems, managed memory can migrate to any processor's memory at any time. The Unified Memory driver will employ heuristics to maintain data locality and prevent excessive page faults to the extent possible. The application can also guide the driver about memory usage patterns via `cuMemAdvise`. The application can also explicitly migrate memory to a desired processor's memory via `cuMemPrefetchAsync`.

In a multi-GPU system where all of the GPUs have a zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS` and all the GPUs have peer-to-peer support with each other, the physical storage for managed memory is created on the GPU which is active at the time `cuMemAllocManaged` is called. All other
GPUs will reference the data at reduced bandwidth via peer mappings over the PCIe bus. The Unified Memory driver does not migrate memory among such GPUs.

In a multi-GPU system where not all GPUs have peer-to-peer support with each other and where the value of the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS` is zero for at least one of those GPUs, the location chosen for physical storage of managed memory is system-dependent.

- On Linux, the location chosen will be device memory as long as the current set of active contexts are on devices that either have peer-to-peer support with each other or have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS`. If there is an active context on a GPU that does not have a non-zero value for that device attribute and it does not have peer-to-peer support with the other devices that have active contexts on them, then the location for physical storage will be ‘zero-copy’ or host memory. Note that this means that managed memory that is located in device memory is migrated to host memory if a new context is created on a GPU that doesn't have a non-zero value for the device attribute and does not support peer-to-peer with at least one of the other devices that has an active context. This in turn implies that context creation may fail if there is insufficient host memory to migrate all managed allocations.

- On Windows, the physical storage is always created in ‘zero-copy’ or host memory. All GPUs will reference the data at reduced bandwidth over the PCIe bus. In these circumstances, use of the environment variable `CUDA_VISIBLE_DEVICES` is recommended to restrict CUDA to only use those GPUs that have peer-to-peer support. Alternatively, users can also set `CUDA_MANAGED_FORCE_DEVICE_ALLOC` to a non-zero value to force the driver to always use device memory for physical storage. When this environment variable is set to a non-zero value, all contexts created in that process on devices that support managed memory have to be peer-to-peer compatible with each other. Context creation will fail if a context is created on a device that supports managed memory and is not peer-to-peer compatible with any of the other managed memory supporting devices on which contexts were previously created, even if those contexts have been destroyed. These environment variables are described in the CUDA programming guide under the "CUDA environment variables" section.

- On ARM, managed memory is not available on discrete gpu with Drive PX-2.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuMemAllocPitch (CUdeviceptr *dptr, size_t *pPitch, size_t WidthInBytes, size_t Height, unsigned int ElementSizeBytes)
Allocates pitched device memory.

Parameters

dptr
- Returned device pointer

pPitch
- Returned pitch of allocation in bytes

WidthInBytes
- Requested allocation width in bytes

Height
- Requested allocation height in rows

ElementSizeBytes
- Size of largest reads/writes for range

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

Description

Allocates at least WidthInBytes * Height bytes of linear memory on the device and returns in *dptr a pointer to the allocated memory. The function may pad the allocation to ensure that corresponding pointers in any given row will continue to meet the alignment requirements for coalescing as the address is updated from row to row. ElementSizeBytes specifies the size of the largest reads and writes that will be performed on the memory range. ElementSizeBytes may be 4, 8 or 16 (since coalesced memory transactions are not possible on other data sizes). If
ElementSizeBytes is smaller than the actual read/write size of a kernel, the kernel will run correctly, but possibly at reduced speed. The pitch returned in *pPitch by cuMemAllocPitch() is the width in bytes of the allocation. The intended usage of pitch is as a separate parameter of the allocation, used to compute addresses within the 2D array. Given the row and column of an array element of type T, the address is computed as:

\[
T^* \text{pElement} = (T^*)(\text{char^*} \text{BaseAddress} + \text{Row} \times \text{Pitch} + \text{Column});
\]

The pitch returned by cuMemAllocPitch() is guaranteed to work with cuMemcpy2D() under all circumstances. For allocations of 2D arrays, it is recommended that programmers consider performing pitch allocations using cuMemAllocPitch(). Due to alignment restrictions in the hardware, this is especially true if the application will be performing 2D memory copies between different regions of device memory (whether linear memory or CUDA arrays).

The byte alignment of the pitch returned by cuMemAllocPitch() is guaranteed to match or exceed the alignment requirement for texture binding with cuTexRefSetAddress2D().

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuMemcpy (CUdeviceptr dst, CUdeviceptr src, size_t ByteCount)
Copies memory.

Parameters

dst
  - Destination unified virtual address space pointer
src
  - Source unified virtual address space pointer

www.nvidia.com
CUDA Driver API
ByteCount
- Size of memory copy in bytes

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Copies data between two pointers. dst and src are base pointers of the destination and source, respectively. ByteCount specifies the number of bytes to copy. Note that this function infers the type of the transfer (host to host, host to device, device to device, or device to host) from the pointer values. This function is only allowed in contexts which support unified addressing.

Note that this function may also return error codes from previous, asynchronous launches.

This function exhibits synchronous behavior for most use cases.

CUresult cuMemcpy2D (const CUDA_MEMCPY2D *pCopy)
Copies memory for 2D arrays.

Parameters

pCopy
- Parameters for the memory copy
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Perform a 2D memory copy according to the parameters specified in pCopy. The CUDA_MEMCPY2D structure is defined as:

```c
typedef struct CUDA_MEMCPY2D_st {
    unsigned int srcXInBytes, srcY;
    CUmemorytype srcMemoryType;
    const void *srcHost;
    CUdeviceptr srcDevice;
    CUarray srcArray;
    unsigned int srcPitch;

    unsigned int dstXInBytes, dstY;
    CUmemorytype dstMemoryType;
    void *dstHost;
    CUdeviceptr dstDevice;
    CUarray dstArray;
    unsigned int dstPitch;

    unsigned int WidthInBytes;
    unsigned int Height;
} CUDA_MEMCPY2D;
```

where:

- srcMemoryType and dstMemoryType specify the type of memory of the source and destination, respectively; CUmemorytype_enum is defined as:

```c
typedef enum CUmemorytype_enum {
    CU_MEMORYTYPE_HOST = 0x01,
    CU_MEMORYTYPE_DEVICE = 0x02,
    CU_MEMORYTYPE_ARRAY = 0x03,
    CU_MEMORYTYPE_UNIFIED = 0x04
} CUmemorytype;
```

If srcMemoryType is CU_MEMORYTYPE_UNIFIED, srcDevice and srcPitch specify the (unified virtual address space) base address of the source data and the bytes per row to apply. srcArray is ignored. This value may be used only if unified addressing is supported in the calling context.

If srcMemoryType is CU_MEMORYTYPE_HOST, srcHost and srcPitch specify the (host) base address of the source data and the bytes per row to apply. srcArray is ignored.

If srcMemoryType is CU_MEMORYTYPE_DEVICE, srcDevice and srcPitch specify the (device) base address of the source data and the bytes per row to apply. srcArray is ignored.

If srcMemoryType is CU_MEMORYTYPE_ARRAY, srcArray specifies the handle of the source data. srcHost, srcDevice and srcPitch are ignored.
If $\text{dstMemoryType}$ is $\text{CU_MEMORYTYPE_HOST}$, $\text{dstHost}$ and $\text{dstPitch}$ specify the (host) base address of the destination data and the bytes per row to apply. $\text{dstArray}$ is ignored.

If $\text{dstMemoryType}$ is $\text{CU_MEMORYTYPE_UNIFIED}$, $\text{dstDevice}$ and $\text{dstPitch}$ specify the (unified virtual address space) base address of the source data and the bytes per row to apply. $\text{dstArray}$ is ignored. This value may be used only if unified addressing is supported in the calling context.

If $\text{dstMemoryType}$ is $\text{CU_MEMORYTYPE_DEVICE}$, $\text{dstDevice}$ and $\text{dstPitch}$ specify the (device) base address of the destination data and the bytes per row to apply. $\text{dstArray}$ is ignored.

If $\text{dstMemoryType}$ is $\text{CU_MEMORYTYPE_ARRAY}$, $\text{dstArray}$ specifies the handle of the destination data. $\text{dstHost}$, $\text{dstDevice}$ and $\text{dstPitch}$ are ignored.

- srcXInBytes and srcY specify the base address of the source data for the copy.

For host pointers, the starting address is

```c
void* Start = (void*)((char*)srcHost+srcY*srcPitch + srcXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr Start = srcDevice+srcY*srcPitch+srcXInBytes;
```

For CUDA arrays, srcXInBytes must be evenly divisible by the array element size.

- dstXInBytes and dstY specify the base address of the destination data for the copy.

For host pointers, the base address is

```c
void* dstStart = (void*)((char*)dstHost+dstY*dstPitch + dstXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr dstStart = dstDevice+dstY*dstPitch+dstXInBytes;
```

For CUDA arrays, dstXInBytes must be evenly divisible by the array element size.

- WidthInBytes and Height specify the width (in bytes) and height of the 2D copy being performed.

  - If specified, srcPitch must be greater than or equal to WidthInBytes + srcXInBytes, and dstPitch must be greater than or equal to WidthInBytes + dstXInBytes.

$\text{cuMemcpy2D()}$ returns an error if any pitch is greater than the maximum allowed (
$\text{CU DEVICE_ATTRIBUTE_MAX_PITCH}$). $\text{cuMemAllocPitch()}$ passes back pitches that always work with $\text{cuMemcpy2D()}$. On intra-device memory copies (device to device, CUDA array to device, CUDA array to CUDA array), $\text{cuMemcpy2D()}$ may fail for pitches not computed by $\text{cuMemAllocPitch()}$. $\text{cuMemcpy2DUnaligned()}$ does not have
this restriction, but may run significantly slower in the cases where \texttt{cuMemcpy2D()} would have returned an error code.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits \textit{synchronous} behavior for most use cases.

void CUDAResult cuMemcpy2DAsync (const CUDA_MEMCPY2D *pCopy, CUstream hStream)
\end{verbatim}

Copies memory for 2D arrays.

\textbf{Parameters}

\begin{itemize}
  \item \textbf{pCopy} - Parameters for the memory copy
  \item \textbf{hStream} - Stream identifier
\end{itemize}

\textbf{Returns}

\begin{verbatim}
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE
\end{verbatim}
Description

Perform a 2D memory copy according to the parameters specified in pCopy. The CUDA_MEMCPY2D structure is defined as:

```c
typedef struct CUDA_MEMCPY2D_st {
    unsigned int srcXInBytes, srcY;
    CUmemorytype srcMemoryType;
    const void *srcHost;
    CUdeviceptr srcDevice;
    CUarray srcArray;
    unsigned int srcPitch;
    unsigned int dstXInBytes, dstY;
    CUmemorytype dstMemoryType;
    void *dstHost;
    CUdeviceptr dstDevice;
    CUarray dstArray;
    unsigned int dstPitch;
    unsigned int WidthInBytes;
    unsigned int Height;
} CUDA_MEMCPY2D;
```

where:

- srcMemoryType and dstMemoryType specify the type of memory of the source and destination, respectively; CUmemorytype_enum is defined as:

```c
typedef enum CUmemorytype_enum {
    CU_MEMORYTYPE_HOST = 0x01,
    CU_MEMORYTYPE_DEVICE = 0x02,
    CU_MEMORYTYPE_ARRAY = 0x03,
    CU_MEMORYTYPE_UNIFIED = 0x04
} CUmemorytype;
```

If srcMemoryType is CU_MEMORYTYPE_HOST, srcHost and srcPitch specify the (host) base address of the source data and the bytes per row to apply. srcArray is ignored.

If srcMemoryType is CU_MEMORYTYPE_UNIFIED, srcDevice and srcPitch specify the (unified virtual address space) base address of the source data and the bytes per row to apply. srcArray is ignored. This value may be used only if unified addressing is supported in the calling context.

If srcMemoryType is CU_MEMORYTYPE_DEVICE, srcDevice and srcPitch specify the (device) base address of the source data and the bytes per row to apply. srcArray is ignored.

If srcMemoryType is CU_MEMORYTYPE_ARRAY, srcArray specifies the handle of the source data. srcHost, srcDevice and srcPitch are ignored.

If dstMemoryType is CU_MEMORYTYPE_UNIFIED, dstDevice and dstPitch specify the (unified virtual address space) base address of the source data and the bytes per row to apply. dstArray is ignored. This value may be used only if unified addressing is supported in the calling context.
If dstMemoryType is `CU_MEMORYTYPE_HOST`, dstHost and dstPitch specify the (host) base address of the destination data and the bytes per row to apply. dstArray is ignored.

If dstMemoryType is `CU_MEMORYTYPEDEVICE`, dstDevice and dstPitch specify the (device) base address of the destination data and the bytes per row to apply. dstArray is ignored.

If dstMemoryType is `CU_MEMORYTYPE_ARRAY`, dstArray specifies the handle of the destination data. dstHost, dstDevice and dstPitch are ignored.

- srcXInBytes and srcY specify the base address of the source data for the copy.

For host pointers, the starting address is

```c
void* Start = (void*)((char*)srcHost+srcY*srcPitch + srcXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr Start = srcDevice+srcY*srcPitch+srcXInBytes;
```

For CUDA arrays, srcXInBytes must be evenly divisible by the array element size.

- dstXInBytes and dstY specify the base address of the destination data for the copy.

For host pointers, the base address is

```c
void* dstStart = (void*)((char*)dstHost+dstY*dstPitch + dstXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr dstStart = dstDevice+dstY*dstPitch+dstXInBytes;
```

For CUDA arrays, dstXInBytes must be evenly divisible by the array element size.

- WidthInBytes and Height specify the width (in bytes) and height of the 2D copy being performed.
- If specified, srcPitch must be greater than or equal to WidthInBytes + srcXInBytes, and dstPitch must be greater than or equal to WidthInBytes + dstXInBytes.
- If specified, srcPitch must be greater than or equal to WidthInBytes + srcXInBytes, and dstPitch must be greater than or equal to WidthInBytes + dstXInBytes.
- If specified, srcHeight must be greater than or equal to Height + srcY, and dstHeight must be greater than or equal to Height + dstY.

cuMemcpy2DAsync() returns an error if any pitch is greater than the maximum allowed (CU_DEVICE_ATTRIBUTE_MAX_PITCH). cuMemAllocPitch() passes back pitches that always work with cuMemcpy2D(). On intra-device memory copies (device to device, CUDA array to device, CUDA array to CUDA array), cuMemcpy2DAsync() may fail for pitches not computed by cuMemAllocPitch().
Note that this function may also return error codes from previous, asynchronous launches.

This function exhibits asynchronous behavior for most use cases.

This function uses standard default stream semantics.

CUresult cuMemcpy2DUnaligned (const CUDA_MEMCPY2D *pCopy)

Copies memory for 2D arrays.

Parameters

- pCopy
  
  - Parameters for the memory copy

Returns

- CUDA_SUCCESS
- CUDA_ERROR_DEINITIALIZED
- CUDA_ERROR_NOT_INITIALIZED
- CUDA_ERROR_INVALID_CONTEXT
- CUDA_ERROR_INVALID_VALUE
Description

Perform a 2D memory copy according to the parameters specified in pCopy. The CUDA_MEMCPY2D structure is defined as:

```
typedef struct CUDA_MEMCPY2D_st {
    unsigned int srcXInBytes, srcY;
    CUmemorytype srcMemoryType;
    const void *srcHost;
    CUdeviceptr srcDevice;
    CUarray srcArray;
    unsigned int srcPitch;
    unsigned int dstXInBytes, dstY;
    CUmemorytype dstMemoryType;
    void *dstHost;
    CUdeviceptr dstDevice;
    CUarray dstArray;
    unsigned int dstPitch;
    unsigned int WidthInBytes;
    unsigned int Height;
} CUDA_MEMCPY2D;
```

where:

- `srcMemoryType` and `dstMemoryType` specify the type of memory of the source and destination, respectively; `CUmemorytype_enum` is defined as:

```
typedef enum CUmemorytype_enum {
    CU_MEMORYTYPE_HOST = 0x01,
    CU_MEMORYTYPE_DEVICE = 0x02,
    CU_MEMORYTYPE_ARRAY = 0x03,
    CU_MEMORYTYPE_UNIFIED = 0x04
} CUmemorytype;
```

If `srcMemoryType` is `CU_MEMORYTYPE_UNIFIED`, `srcDevice` and `srcPitch` specify the (unified virtual address space) base address of the source data and the bytes per row to apply. `srcArray` is ignored. This value may be used only if unified addressing is supported in the calling context.

If `srcMemoryType` is `CU_MEMORYTYPE_HOST`, `srcHost` and `srcPitch` specify the (host) base address of the source data and the bytes per row to apply. `srcArray` is ignored.

If `srcMemoryType` is `CU_MEMORYTYPE_DEVICE`, `srcDevice` and `srcPitch` specify the (device) base address of the source data and the bytes per row to apply. `srcArray` is ignored.

If `srcMemoryType` is `CU_MEMORYTYPE_ARRAY`, `srcArray` specifies the handle of the source data. `srcHost`, `srcDevice` and `srcPitch` are ignored.

If `dstMemoryType` is `CU_MEMORYTYPE_UNIFIED`, `dstDevice` and `dstPitch` specify the (unified virtual address space) base address of the source data and the bytes per row to apply. `dstArray` is ignored. This value may be used only if unified addressing is supported in the calling context.
If `dstMemoryType` is `CU_MEMORYTYPE_HOST`, `dstHost` and `dstPitch` specify the (host) base address of the destination data and the bytes per row to apply. `dstArray` is ignored.

If `dstMemoryType` is `CU_MEMORYTYPE_DEVICE`, `dstDevice` and `dstPitch` specify the (device) base address of the destination data and the bytes per row to apply. `dstArray` is ignored.

If `dstMemoryType` is `CU_MEMORYTYPE_ARRAY`, `dstArray` specifies the handle of the destination data. `dstHost`, `dstDevice` and `dstPitch` are ignored.

- `srcXInBytes` and `srcY` specify the base address of the source data for the copy.

For host pointers, the starting address is

```c
void* Start = (void*)((char*)srcHost+srcY*srcPitch + srcXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr Start = srcDevice+srcY*srcPitch+srcXInBytes;
```

For CUDA arrays, `srcXInBytes` must be evenly divisible by the array element size.

- `dstXInBytes` and `dstY` specify the base address of the destination data for the copy.

For host pointers, the base address is

```c
void* dstStart = (void*)((char*)dstHost+dstY*dstPitch + dstXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr dstStart = dstDevice+dstY*dstPitch+dstXInBytes;
```

For CUDA arrays, `dstXInBytes` must be evenly divisible by the array element size.

- `WidthInBytes` and `Height` specify the width (in bytes) and height of the 2D copy being performed.

  - If specified, `srcPitch` must be greater than or equal to `WidthInBytes + srcXInBytes`, and `dstPitch` must be greater than or equal to `WidthInBytes + dstXInBytes`.

`cuMemcp2D()` returns an error if any pitch is greater than the maximum allowed (`CU_DEVICE_ATTRIBUTE_MAX_PITCH`). `cuMemAllocPitch()` passes back pitches that always work with `cuMemcp2D()`. On intra-device memory copies (device to device, CUDA array to device, CUDA array to CUDA array), `cuMemcp2D()` may fail for pitches not computed by `cuMemAllocPitch()`. `cuMemcp2DUnaligned()` does not have this restriction, but may run significantly slower in the cases where `cuMemcp2D()` would have returned an error code.

- Note that this function may also return error codes from previous, asynchronous launches.
This function exhibits synchronous behavior for most use cases.

CUresult cuMemcpy3D (const CUDA_MEMCPY3D *pCopy)
Copies memory for 3D arrays.

Parameters
pCopy
- Parameters for the memory copy

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE
Description

Perform a 3D memory copy according to the parameters specified in pCopy. The `CUDA_MEMCPY3D` structure is defined as:

```c
typedef struct CUDA_MEMCPY3D_st {
    unsigned int srcXInBytes, srcY, srcZ;
    unsigned int srcLOD;
    CUmemorytype srcMemoryType;
    const void *srcHost;
    CUdeviceptr srcDevice;
    CUarray srcArray;
    unsigned int srcPitch;  // ignored when src is array
    unsigned int srcHeight; // ignored when src is array; may be 0 if Depth==1
    unsigned int dstXInBytes, dstY, dstZ;
    unsigned int dstLOD;
    CUmemorytype dstMemoryType;
    void *dstHost;
    CUdeviceptr dstDevice;
    CUarray dstArray;
    unsigned int dstPitch;  // ignored when dst is array
    unsigned int dstHeight; // ignored when dst is array; may be 0 if Depth==1
    unsigned int WidthInBytes;
    unsigned int Height;
    unsigned int Depth;
} CUDA_MEMCPY3D;
```

where:

- `srcMemoryType` and `dstMemoryType` specify the type of memory of the source and destination, respectively; `CUmemorytype_enum` is defined as:

```c
typedef enum CUmemorytype_enum {
    CU_MEMORYTYPE_HOST = 0x01,
    CU_MEMORYTYPE_DEVICE = 0x02,
    CU_MEMORYTYPE_ARRAY = 0x03,
    CU_MEMORYTYPE_UNIFIED = 0x04
} CUmemorytype;
```

If `srcMemoryType` is `CU_MEMORYTYPE_UNIFIED`, `srcDevice` and `srcPitch` specify the (unified virtual address space) base address of the source data and the bytes per row to apply. `srcArray` is ignored. This value may be used only if unified addressing is supported in the calling context.

If `srcMemoryType` is `CU_MEMORYTYPE_HOST`, `srcHost`, `srcPitch` and `srcHeight` specify the (host) base address of the source data, the bytes per row, and the height of each 2D slice of the 3D array. `srcArray` is ignored.

If `srcMemoryType` is `CU_MEMORYTYPE_DEVICE`, `srcDevice`, `srcPitch` and `srcHeight` specify the (device) base address of the source data, the bytes per row, and the height of each 2D slice of the 3D array. `srcArray` is ignored.
If srcMemoryType is `CU_MEMORYTYPE_ARRAY`, srcArray specifies the handle of the source data. srcHost, srcDevice, srcPitch and srcHeight are ignored.

If dstMemoryType is `CU_MEMORYTYPE_UNIFIED`, dstDevice and dstPitch specify the (unified virtual address space) base address of the source data and the bytes per row to apply. dstArray is ignored. This value may be used only if unified addressing is supported in the calling context.

If dstMemoryType is `CU_MEMORYTYPE_HOST`, dstHost and dstPitch specify the (host) base address of the destination data, the bytes per row, and the height of each 2D slice of the 3D array. dstArray is ignored.

If dstMemoryType is `CU_MEMORYTYPE_DEVICE`, dstDevice and dstPitch specify the (device) base address of the destination data, the bytes per row, and the height of each 2D slice of the 3D array. dstArray is ignored.

If dstMemoryType is `CU_MEMORYTYPE_ARRAY`, dstArray specifies the handle of the destination data. dstHost, dstDevice, dstPitch and dstHeight are ignored.

- srcXInBytes, srcY and srcZ specify the base address of the source data for the copy.

For host pointers, the starting address is

```c
void* Start = (void*)((char*)srcHost+(srcZ*srcHeight+srcY)*srcPitch + srcXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr Start = srcDevice+(srcZ*srcHeight+srcY)*srcPitch+srcXInBytes;
```

For CUDA arrays, srcXInBytes must be evenly divisible by the array element size.

- dstXInBytes, dstY and dstZ specify the base address of the destination data for the copy.

For host pointers, the base address is

```c
void* dstStart = (void*)((char*)dstHost+(dstZ*dstHeight+dstY)*dstPitch + dstXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr dstStart = dstDevice+(dstZ*dstHeight+dstY)*dstPitch+dstXInBytes;
```

For CUDA arrays, dstXInBytes must be evenly divisible by the array element size.

- WidthInBytes, Height and Depth specify the width (in bytes), height and depth of the 3D copy being performed.
- If specified, srcPitch must be greater than or equal to WidthInBytes + srcXInBytes, and dstPitch must be greater than or equal to WidthInBytes + dstXInBytes.
- If specified, srcHeight must be greater than or equal to Height + srcY, and dstHeight must be greater than or equal to Height + dstY.
cuMemcpy3D() returns an error if any pitch is greater than the maximum allowed (CU_DEVICE_ATTRIBUTE_MAX_PITCH).

The srcLOD and dstLOD members of the CUDA_MEMCPY3D structure must be set to 0.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits synchronous behavior for most use cases.

See also:

**CUresult cuMemcpy3DAsync (const CUDA_MEMCPY3D *pCopy, CUstream hStream)**

Copies memory for 3D arrays.

**Parameters**

pCopy
- Parameters for the memory copy

hStream
- Stream identifier

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE
Description

Perform a 3D memory copy according to the parameters specified in pCopy. The CUDA_MEMCPY3D structure is defined as:

```c
typedef struct CUDA_MEMCPY3D_st {
    unsigned int srcXInBytes, srcY, srcZ;
    unsigned int srcLOD;
    CUmemorytype srcMemoryType;
    const void *srcHost;
    CUDeviceptr srcDevice;
    CUarray srcArray;
    unsigned int srcPitch;  // ignored when src is array
    unsigned int srcHeight; // ignored when src is array; may be 0 if Depth==1
    unsigned int dstXInBytes, dstY, dstZ;
    unsigned int dstLOD;
    CUmemorytype dstMemoryType;
    void *dstHost;
    CUDeviceptr dstDevice;
    CUarray dstArray;
    unsigned int dstPitch;  // ignored when dst is array
    unsigned int dstHeight; // ignored when dst is array; may be 0 if Depth==1
    unsigned int WidthInBytes;
    unsigned int Height;
    unsigned int Depth;
} CUDA_MEMCPY3D;
```

where:

- srcMemoryType and dstMemoryType specify the type of memory of the source and destination, respectively; CUmemorytype_enum is defined as:

```c
typedef enum CUmemorytype_enum {
    CU_MEMORYTYPE_HOST = 0x01,
    CU_MEMORYTYPE_DEVICE = 0x02,
    CU_MEMORYTYPE_ARRAY = 0x03,
    CU_MEMORYTYPE_UNIFIED = 0x04
} CUmemorytype;
```

If srcMemoryType is CU_MEMORYTYPE_UNIFIED, srcDevice and srcPitch specify the (unified virtual address space) base address of the source data and the bytes per row to apply. srcArray is ignored. This value may be used only if unified addressing is supported in the calling context.

If srcMemoryType is CU_MEMORYTYPE_HOST, srcHost, srcPitch and srcHeight specify the (host) base address of the source data, the bytes per row, and the height of each 2D slice of the 3D array. srcArray is ignored.

If srcMemoryType is CU_MEMORYTYPE_DEVICE, srcDevice, srcPitch and srcHeight specify the (device) base address of the source data, the bytes per row, and the height of each 2D slice of the 3D array. srcArray is ignored.
If srcMemoryType is `CU_MEMORYTYPE_ARRAY`, srcArray specifies the handle of the source data. srcHost, srcDevice, srcPitch and srcHeight are ignored.

If dstMemoryType is `CU_MEMORYTYPE_UNIFIED`, dstDevice and dstPitch specify the (unified virtual address space) base address of the source data and the bytes per row to apply. dstArray is ignored. This value may be used only if unified addressing is supported in the calling context.

If dstMemoryType is `CU_MEMORYTYPE_HOST`, dstHost and dstPitch specify the (host) base address of the destination data, the bytes per row, and the height of each 2D slice of the 3D array. dstArray is ignored.

If dstMemoryType is `CU_MEMORYTYPE_DEVICE`, dstDevice and dstPitch specify the (device) base address of the destination data, the bytes per row, and the height of each 2D slice of the 3D array. dstArray is ignored.

If dstMemoryType is `CU_MEMORYTYPE_ARRAY`, dstArray specifies the handle of the destination data. dstHost, dstDevice, dstPitch and dstHeight are ignored.

- srcXInBytes, srcY and srcZ specify the base address of the source data for the copy.

For host pointers, the starting address is

```c
void* Start = (void*)((char*)srcHost+(srcZ*srcHeight+srcY)*srcPitch + srcXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr Start = srcDevice+(srcZ*srcHeight+srcY)*srcPitch+srcXInBytes;
```

For CUDA arrays, srcXInBytes must be evenly divisible by the array element size.

- dstXInBytes, dstY and dstZ specify the base address of the destination data for the copy.

For host pointers, the base address is

```c
void* dstStart = (void*)((char*)dstHost+(dstZ*dstHeight+dstY)*dstPitch + dstXInBytes);
```

For device pointers, the starting address is

```c
CUdeviceptr dstStart = dstDevice+(dstZ*dstHeight+dstY)*dstPitch+dstXInBytes;
```

For CUDA arrays, dstXInBytes must be evenly divisible by the array element size.

- WidthInBytes, Height and Depth specify the width (in bytes), height and depth of the 3D copy being performed.

- If specified, srcPitch must be greater than or equal to WidthInBytes + srcXInBytes, and dstPitch must be greater than or equal to WidthInBytes + dstXInBytes.

- If specified, srcHeight must be greater than or equal to Height + srcY, and dstHeight must be greater than or equal to Height + dstY.
cuMemcpy3DAsync() returns an error if any pitch is greater than the maximum allowed (CU_DEVICE_ATTRIBUTE_MAX_PITCH).

The srcLOD and dstLOD members of the CUDA_MEMCPY3D structure must be set to 0.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

See also:

CUresult cuMemcpy3DPeer (const CUDA_MEMCPY3D_PEER *pCopy)
Copies memory between contexts.

Parameters

pCopy
- Parameters for the memory copy

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE
Description

Perform a 3D memory copy according to the parameters specified in `pCopy`. See the definition of the `CUDA_MEMCPY3D_PEER` structure for documentation of its parameters.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits synchronous behavior for most use cases.

See also:

`cuMemcpyDtoD`, `cuMemcpyPeer`, `cuMemcpyDtoDAsync`, `cuMemcpyPeerAsync`, `cuMemcpy3DPeerAsync`, `cudaMemcpy3DPeer`

`CUresult cuMemcpy3DPeerAsync (const CUDA_MEMCPY3D_PEER *pCopy, CUstream hStream)`

Copies memory between contexts asynchronously.

Parameters

- `pCopy` - Parameters for the memory copy
- `hStream` - Stream identifier

Returns

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_VALUE`

Description

Perform a 3D memory copy according to the parameters specified in `pCopy`. See the definition of the `CUDA_MEMCPY3D_PEER` structure for documentation of its parameters.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.
CUresult cuMemcpyAsync (CUdeviceptr dst, CUdeviceptr src, size_t ByteCount, CUstream hStream)

Copies memory asynchronously.

Parameters

dst - Destination unified virtual address space pointer
src - Source unified virtual address space pointer
ByteCount - Size of memory copy in bytes
hStream - Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description

Copies data between two pointers. dst and src are base pointers of the destination and source, respectively. ByteCount specifies the number of bytes to copy. Note that this function infers the type of the transfer (host to host, host to device, device to device, or device to host) from the pointer values. This function is only allowed in contexts which support unified addressing.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

See also:

cuArray3DCreate, cuArray3DGetDescriptor, cuArrayCreate, cuArrayDestroy, cuArrayGetDescriptor, cuMemAlloc, cuMemAllocHost, cuMemAllocPitch, cuMemcpy2D, cuMemcpy2DAsync, cuMemcpy2DUnaligned, cuMemcpy3D,

CUresult cuMemcpyAtoA (CUarray dstArray, size_t dstOffset, CUarray srcArray, size_t srcOffset, size_t ByteCount)

Copies memory from Array to Array.

Parameters

dstArray
- Destination array
dstOffset
- Offset in bytes of destination array
srcArray
- Source array
srcOffset
- Offset in bytes of source array
ByteCount
- Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Copies from one 1D CUDA array to another. dstArray and srcArray specify the handles of the destination and source CUDA arrays for the copy, respectively. dstOffset and srcOffset specify the destination and source offsets in bytes into the CUDA arrays. ByteCount is the number of bytes to be copied. The size of the elements in the CUDA arrays need not be the same format, but the elements must be the same size; and count must be evenly divisible by that size.
CUresult cuMemcpyAtoD (CUdeviceptr dstDevice, CUarray srcArray, size_t srcOffset, size_t ByteCount)

Copies memory from Array to Device.

Parameters

- **dstDevice**
  - Destination device pointer
- **srcArray**
  - Source array
- **srcOffset**
  - Offset in bytes of source array
- **ByteCount**
  - Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Copies from one 1D CUDA array to device memory. **dstDevice** specifies the base pointer of the destination and must be naturally aligned with the CUDA array elements. **srcArray** and **srcOffset** specify the CUDA array handle and the offset in bytes into
the array where the copy is to begin. **ByteCount** specifies the number of bytes to copy and must be evenly divisible by the array element size.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits **synchronous** behavior for most use cases.

**See also:**

**CUDA➲ cuMemcpyAtoH (void *dstHost, CUarray srcArray, size_t srcOffset, size_t ByteCount)**

Copies memory from Array to Host.

**Parameters**
- **dstHost**
  - Destination device pointer
- **srcArray**
  - Source array
- **srcOffset**
  - Offset in bytes of source array
- **ByteCount**
  - Size of memory copy in bytes

**Returns**
- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE
**Description**

Copies from one 1D CUDA array to host memory. `dstHost` specifies the base pointer of the destination. `srcArray` and `srcOffset` specify the CUDA array handle and starting offset in bytes of the source data. `ByteCount` specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits **synchronous** behavior for most use cases.

**See also:**

**CUresult cuMemcpyAtoHAsync (void *dstHost, CUarray srcArray, size_t srcOffset, size_t ByteCount, CUstream hStream)**

Copies memory from Array to Host.

**Parameters**

- **dstHost**
  - Destination pointer
- **srcArray**
  - Source array
- **srcOffset**
  - Offset in bytes of source array
- **ByteCount**
  - Size of memory copy in bytes
- **hStream**
  - Stream identifier
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Copies from one 1D CUDA array to host memory. dstHost specifies the base pointer of the destination. srcArray and srcOffset specify the CUDA array handle and starting offset in bytes of the source data. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

CUresult cuMemcpyDtoA (CUarray dstArray, size_t dstOffset, CUdeviceptr srcDevice, size_t ByteCount)
Copies memory from Device to Array.

Parameters
dstArray
- Destination array
dstOffset
- Offset in bytes of destination array
srcDevice
- Source device pointer

ByteCount
- Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Copies from device memory to a 1D CUDA array. dstArray and dstOffset specify the CUDA array handle and starting index of the destination data. srcDevice specifies the base pointer of the source. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits synchronous behavior for most use cases.

CUresult cuMemcpyDtoD (CUdeviceptr dstDevice, 
CUdeviceptr srcDevice, size_t ByteCount)

Copies memory from Device to Device.

Parameters

dstDevice
- Destination device pointer
srcDevice
- Source device pointer

ByteCount
- Size of memory copy in bytes

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Copies from device memory to device memory. dstDevice and srcDevice are the
base pointers of the destination and source, respectively. ByteCount specifies the
number of bytes to copy.

‣ Note that this function may also return error codes from previous, asynchronous
launches.
‣ This function exhibits synchronous behavior for most use cases.

srcDevice
- Source device pointer

ByteCount
- Size of memory copy in bytes

hStream
- Stream identifier

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Copies from device memory to device memory. dstDevice and srcDevice are the base pointers of the destination and source, respectively. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

See also:
CUresult cuMemcpyDtoH (void *dstHost, CUdeviceptr srcDevice, size_t ByteCount)

Copies memory from Device to Host.

Parameters

dstHost
  - Destination host pointer
srcDevice
  - Source device pointer
ByteCount
  - Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Copies from device to host memory. dstHost and srcDevice specify the base pointers of the destination and source, respectively. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits synchronous behavior for most use cases.

CUresult cuMemcpyDtoHAsync (void *dstHost, CUdeviceptr srcDevice, size_t ByteCount, CUstream hStream)

Copies memory from Device to Host.

Parameters

- **dstHost**
  - Destination host pointer
- **srcDevice**
  - Source device pointer
- **ByteCount**
  - Size of memory copy in bytes
- **hStream**
  - Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description

Copies from device to host memory. **dstHost** and **srcDevice** specify the base pointers of the destination and source, respectively. **ByteCount** specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

CUDA result cuMemcpyHtoA (CUarray dstArray, size_t dstOffset, const void *srcHost, size_t ByteCount)

Copies memory from Host to Array.

Parameters

dstArray
  - Destination array
dstOffset
  - Offset in bytes of destination array
srcHost
  - Source host pointer
ByteCount
  - Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Copies from host memory to a 1D CUDA array. dstArray and dstOffset specify the CUDA array handle and starting offset in bytes of the destination data. pSrc specifies the base address of the source. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits synchronous behavior for most use cases.

CUresult cuMemcpyHtoAAsync (CUarray dstArray, size_t dstOffset, const void *srcHost, size_t ByteCount, CUstream hStream)
Copies memory from Host to Array.

Parameters

dstArray
- Destination array
dstOffset
- Offset in bytes of destination array
srcHost
- Source host pointer
ByteCount
- Size of memory copy in bytes
hStream
- Stream identifier

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Copies from host memory to a 1D CUDA array. \texttt{dstArray} and \texttt{dstOffset} specify the CUDA array handle and starting offset in bytes of the destination data. \texttt{srcHost} specifies the base address of the source. \texttt{ByteCount} specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

CUresult cuMemcpyHtoD (CUdeviceptr dstDevice, const void *srcHost, size_t ByteCount)
Copies memory from Host to Device.

Parameters

dstDevice
- Destination device pointer

srcHost
- Source host pointer

ByteCount
- Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Copies from host memory to device memory. dstDevice and srcHost are the base addresses of the destination and source, respectively. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits synchronous behavior for most use cases.
See also:

CUresult cuMemcpyHtoDAsync (CUdeviceptr dstDevice, const void *srcHost, size_t ByteCount, CUstream hStream)
Copies memory from Host to Device.

Parameters

dstDevice
- Destination device pointer
srcHost
- Source host pointer
ByteCount
- Size of memory copy in bytes
hStream
- Stream identifier

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Copies from host memory to device memory. dstDevice and srcHost are the base addresses of the destination and source, respectively. ByteCount specifies the number of bytes to copy.

Note that this function may also return error codes from previous, asynchronous launches.
This function exhibits asynchronous behavior for most use cases.

This function uses standard default stream semantics.

CUresult cuMemcpyPeer (CUdeviceptr dstDevice,
CUcontext dstContext, CUdeviceptr srcDevice,
CUcontext srcContext, size_t ByteCount)

Copies device memory between two contexts.

Parameters

dstDevice
- Destination device pointer
dstContext
- Destination context
srcDevice
- Source device pointer
srcContext
- Source context
ByteCount
- Size of memory copy in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE
Description
Copies from device memory in one context to device memory in another context. 
dstDevice is the base device pointer of the destination memory and dstContext is 
the destination context. srcDevice is the base device pointer of the source memory and 
srcContext is the source pointer. ByteCount specifies the number of bytes to copy.

Note that this function may also return error codes from previous, asynchronous 
launches.

This function exhibits synchronous behavior for most use cases.

See also:
cuMemcpyDtoD, cuMemcpy3DPeer, cuMemcpyDtoDAsync, cuMemcpyPeerAsync,

CUresult cuMemcpyPeerAsync (CUdeviceptr dstDevice, 
CUcontext dstContext, CUdeviceptr srcDevice, 
CUcontext srcContext, size_t ByteCount, CUstream 
hStream)
Copies device memory between two contexts asynchronously.

Parameters

dstDevice
- Destination device pointer

dstContext
- Destination context

srcDevice
- Source device pointer

srcContext
- Source context

ByteCount
- Size of memory copy in bytes

hStream
- Stream identifier

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, 
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, 
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE
Description

Copies from device memory in one context to device memory in another context. 

dstDevice is the base device pointer of the destination memory and dstContext is the destination context. srcDevice is the base device pointer of the source memory and srcContext is the source pointer. ByteCount specifies the number of bytes to copy.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

See also:

cuMemcpyDtoD, cuMemcpyPeer, cuMemcpy3DPeer, cuMemcpyDtoDAsync, cuMemcpy3DPeerAsync, cudaMemcpyPeerAsync

CUresult cuMemFree (CUdeviceptr dptr)

Frees device memory.

Parameters

dptr
- Pointer to memory to free

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Frees the memory space pointed to by dptr, which must have been returned by a previous call to cuMemAlloc() or cuMemAllocPitch().

- Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuArray3DCreate, cuArray3DGetDescriptor, cuArrayCreate, cuArrayDestroy, cuArrayGetDescriptor, cuMemAlloc, cuMemAllocHost, cuMemAllocPitch,

**CUresult cuMemFreeHost (void *p)**

Frees page-locked host memory.

**Parameters**

**P**
- Pointer to memory to free

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

**Description**

Frees the memory space pointed to by `p`, which must have been returned by a previous call to `cuMemAllocHost()`.

---

**Note that this function may also return error codes from previous, asynchronous launches.**

**See also:**

CUresult cuMemGetAddressRange (CUdeviceptr *pbase, 
size_t *psize, CUdeviceptr dptr)

Get information on memory allocations.

Parameters

pbase
- Returned base address

psize
- Returned size of device memory allocation

dptr
- Device pointer to query

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, 
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, 
CUDA_ERROR_NOT_FOUND, CUDA_ERROR_INVALID_VALUE

Description

Returns the base address in *pbase and size in *psize of the allocation by 
cuMemAlloc() or cuMemAllocPitch() that contains the input pointer dptr. Both 
parameters pbase and psize are optional. If one of them is NULL, it is ignored.

Note that this function may also return error codes from previous, asynchronous 
launches.

cuMemsetD2D32, cuMemsetD8, cuMemsetD16, cuMemsetD32
CUresult cuMemGetInfo (size_t *free, size_t *total)

Gets free and total memory.

Parameters

free
- Returned free memory in bytes

total
- Returned total memory in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Returns in *free and *total respectively, the free and total amount of memory available for allocation by the CUDA context, in bytes.

Note that this function may also return error codes from previous, asynchronous launches.

CUresult cuMemHostAlloc (void **pp, size_t bytesize, unsigned int Flags)

Allocates page-locked host memory.

Parameters

pp
- Returned host pointer to page-locked memory
bytesize
- Requested allocation size in bytes
Flags
- Flags for allocation request

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

Description

Allocates bytesize bytes of host memory that is page-locked and accessible to the device. The driver tracks the virtual memory ranges allocated with this function and automatically accelerates calls to functions such as cuMemcpyHtoD(). Since the memory can be accessed directly by the device, it can be read or written with much higher bandwidth than pageable memory obtained with functions such as malloc(). Allocating excessive amounts of pinned memory may degrade system performance, since it reduces the amount of memory available to the system for paging. As a result, this function is best used sparingly to allocate staging areas for data exchange between host and device.

The Flags parameter enables different options to be specified that affect the allocation, as follows.

- **CU_MEMHOSTALLOC_PORTABLE**: The memory returned by this call will be considered as pinned memory by all CUDA contexts, not just the one that performed the allocation.

- **CU_MEMHOSTALLOC_DEVICEMAP**: Maps the allocation into the CUDA address space. The device pointer to the memory may be obtained by calling cuMemHostGetDevicePointer().

- **CU_MEMHOSTALLOC_WRITECOMBINED**: Allocates the memory as write-combined (WC). WC memory can be transferred across the PCI Express bus more quickly on some system configurations, but cannot be read efficiently by most CPUs. WC memory is a good option for buffers that will be written by the CPU and read by the GPU via mapped pinned memory or host->device transfers.
All of these flags are orthogonal to one another: a developer may allocate memory that is portable, mapped and/or write-combined with no restrictions.

The CUDA context must have been created with the CU_CTX_MAP_HOST flag in order for the CU_MEMHOSTALLOC_DEVICEMAP flag to have any effect.

The CU_MEMHOSTALLOC_DEVICEMAP flag may be specified on CUDA contexts for devices that do not support mapped pinned memory. The failure is deferred to cuMemHostGetDevicePointer() because the memory may be mapped into other CUDA contexts via the CU_MEMHOSTALLOC_PORTABLE flag.

The memory allocated by this function must be freed with cuMemFreeHost().

Note all host memory allocated using cuMemHostAlloc() will automatically be immediately accessible to all contexts on all devices which support unified addressing (as may be queried using CU_DEVICE_ATTRIBUTE_UNIFIED_ADDRESSING). Unless the flag CU_MEMHOSTALLOC_WRITECOMBINED is specified, the device pointer that may be used to access this host memory from those contexts is always equal to the returned host pointer *pp. If the flag CU_MEMHOSTALLOC_WRITECOMBINED is specified, then the function cuMemHostGetDevicePointer() must be used to query the device pointer, even if the context supports unified addressing. See Unified Addressing for additional details.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
CUresult cuMemHostGetDevicePointer (CUdeviceptr *pdptr, void *p, unsigned int Flags)

Passes back device pointer of mapped pinned memory.

**Parameters**

*pdptr*  
- Returned device pointer

*P*  
- Host pointer

*Flags*  
- Options (must be 0)

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

**Description**

Passes back the device pointer *pdptr* corresponding to the mapped, pinned host buffer *p* allocated by cuMemHostAlloc.

`cuMemHostGetDevicePointer()` will fail if the `CU_MEMHOSTALLOC_DEVICEMAP` flag was not specified at the time the memory was allocated, or if the function is called on a GPU that does not support mapped pinned memory.

For devices that have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CAN_USE_HOST_POINTER_FOR_REGISTERED_MEM`, the memory can also be accessed from the device using the host pointer *p*. The device pointer returned by `cuMemHostGetDevicePointer()` may or may not match the original host pointer *p* and depends on the devices visible to the application. If all devices visible to the application have a non-zero value for the device attribute, the device pointer returned by `cuMemHostGetDevicePointer()` will match the original pointer *p*. If any device visible to the application has a zero value for the device attribute, the device pointer returned by `cuMemHostGetDevicePointer()` will not match the original host pointer *p*, but it will be suitable for use on all devices provided Unified Virtual Addressing is enabled. In such systems, it is valid to access the memory using either pointer on devices that have a non-zero value for the device attribute. Note however that such devices should access the memory using only of the two pointers and not both.

*Flags* provides for future releases. For now, it must be set to 0.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuMemHostGetFlags (unsigned int *pFlags, void *p)

Passes back flags that were used for a pinned allocation.

Parameters

pFlags
- Returned flags word

p
- Host pointer

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Passes back the flags pFlags that were specified when allocating the pinned host buffer p allocated by cuMemHostAlloc.

cuMemHostGetFlags() will fail if the pointer does not reside in an allocation performed by cuMemAllocHost() or cuMemHostAlloc().
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuMemAllocHost, cuMemHostAlloc, cudaHostGetFlags

CUresult cuMemHostRegister (void *p, size_t bytesize, unsigned int Flags)
Registers an existing host memory range for use by CUDA.

Parameters

p
- Host pointer to memory to page-lock
bytesize
- Size in bytes of the address range to page-lock
Flags
- Flags for allocation request

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_HOST_MEMORY_ALREADY_REGISTERED,
CUDA_ERROR_NOT_PERMITTED, CUDA_ERROR_NOT_SUPPORTED

Description
Page-locks the memory range specified by p and bytesize and maps it for the device(s) as specified by Flags. This memory range also is added to the same tracking mechanism as cuMemHostAlloc to automatically accelerate calls to functions such as cuMemcpyHtoD(). Since the memory can be accessed directly by the device, it can be read or written with much higher bandwidth than pageable memory that has not been registered. Page-locking excessive amounts of memory may degrade system performance, since it reduces the amount of memory available to the system for paging. As a result, this function is best used sparingly to register staging areas for data exchange between host and device.

This function has limited support on Mac OS X. OS 10.7 or higher is required.

The Flags parameter enables different options to be specified that affect the allocation, as follows.
CU_MEMHOSTREGISTER_PORTABLE: The memory returned by this call will be considered as pinned memory by all CUDA contexts, not just the one that performed the allocation.

CU_MEMHOSTREGISTER_DEVICEMAP: Maps the allocation into the CUDA address space. The device pointer to the memory may be obtained by calling cuMemHostGetDevicePointer().

CU_MEMHOSTREGISTER_IOMEMORY: The pointer is treated as pointing to some I/O memory space, e.g. the PCI Express resource of a 3rd party device.

All of these flags are orthogonal to one another: a developer may page-lock memory that is portable or mapped with no restrictions.

The CUDA context must have been created with the CU_CTX_MAP_HOST flag in order for the CU_MEMHOSTREGISTER_DEVICEMAP flag to have any effect.

The CU_MEMHOSTREGISTER_DEVICEMAP flag may be specified on CUDA contexts for devices that do not support mapped pinned memory. The failure is deferred to cuMemHostGetDevicePointer() because the memory may be mapped into other CUDA contexts via the CU_MEMHOSTREGISTER_PORTABLE flag.

For devices that have a non-zero value for the device attribute CU_DEVICE_ATTRIBUTE_CAN_USE_HOST_POINTER_FORREGISTERED_MEM, the memory can also be accessed from the device using the host pointer p. The device pointer returned by cuMemHostGetDevicePointer() may or may not match the original host pointer ptr and depends on the devices visible to the application. If all devices visible to the application have a non-zero value for the device attribute, the device pointer returned by cuMemHostGetDevicePointer() will match the original pointer ptr. If any device visible to the application has a zero value for the device attribute, the device pointer returned by cuMemHostGetDevicePointer() will not match the original host pointer ptr, but it will be suitable for use on all devices provided Unified Virtual Addressing is enabled. In such systems, it is valid to access the memory using either pointer on devices that have a non-zero value for the device attribute. Note however that such devices should access the memory using only of the two pointers and not both.

The memory page-locked by this function must be unregistered with cuMemHostUnregister().

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuMemHostUnregister, cuMemHostGetFlags, cuMemHostGetDevicePointer, cudaHostRegister
CUresult cuMemHostUnregister (void *p)
Unregisters a memory range that was registered with cuMemHostRegister.

Parameters

p
- Host pointer to memory to unregister

Returns
CU_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_HOST_MEMORY_NOT_REGISTERED,

Description
Unmaps the memory range whose base address is specified by p, and makes it pageable
again.

The base address must be the same one specified to cuMemHostRegister().

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuMemHostRegister, cudaHostUnregister

CUresult cuMemsetD16 (CUdeviceptr dstDevice,
unsigned short us, size_t N)
Initializes device memory.

Parameters
dstDevice
- Destination device pointer
us
- Value to set
N
- Number of elements
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Sets the memory range of $N$ 16-bit values to the specified value $us$. The $dstDevice$
pointer must be two byte aligned.

- Note that this function may also return error codes from previous, asynchronous
  launches.
- See also memset synchronization details.

CUresult cuMemsetD16Async (CUdeviceptr dstDevice,
unsigned short us, size_t N, CUstream hStream)
Sets device memory.

Parameters
dstDevice
  - Destination device pointer
us
  - Value to set
N
  - Number of elements
hStream
- Stream identifier

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description
Sets the memory range of \( N \) 16-bit values to the specified value \( u_s \). The dstDevice pointer must be two byte aligned.

- Note that this function may also return error codes from previous, asynchronous launches.
- See also memset synchronization details.
- This function uses standard default stream semantics.

See also:

CUresult cuMemsetD2D16 (CUdeviceptr dstDevice, size_t dstPitch, unsigned short us, size_t Width, size_t Height)
Initializes device memory.

Parameters
dstDevice
- Destination device pointer
**dstPitch**
- Pitch of destination device pointer

**us**
- Value to set

**Width**
- Width of row

**Height**
- Number of rows

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

**Description**

Sets the 2D memory range of Width 16-bit values to the specified value us. Height specifies the number of rows to set, and dstPitch specifies the number of bytes between each row. The dstDevice pointer and dstPitch offset must be two byte aligned. This function performs fastest when the pitch is one that has been passed back by cuMemAllocPitch().

- Note that this function may also return error codes from previous, asynchronous launches.
- See also memset synchronization details.

CUresult cuMemsetD2D16Async (CUdeviceptr dstDevice, size_t dstPitch, unsigned short us, size_t Width, size_t Height, CUstream hStream)

Sets device memory.

Parameters

dstDevice
- Destination device pointer
dstPitch
- Pitch of destination device pointer
us
- Value to set
Width
- Width of row
Height
- Number of rows
hStream
- Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Sets the 2D memory range of Width 16-bit values to the specified value us. Height specifies the number of rows to set, and dstPitch specifies the number of bytes between each row. The dstDevice pointer and dstPitch offset must be two byte aligned. This function performs fastest when the pitch is one that has been passed back by cuMemAllocPitch().

CUresult cuMemsetD2D32 (CUdeviceptr dstDevice, 
size_t dstPitch, unsigned int ui, size_t Width, size_t Height)
Initializes device memory.

Parameters

dstDevice
  - Destination device pointer
dstPitch
  - Pitch of destination device pointer
ui
  - Value to set
Width
  - Width of row
Height
  - Number of rows

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, 
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, 
CUDA_ERROR_INVALID_VALUE

Description

Sets the 2D memory range of Width 32-bit values to the specified value ui. Height 
specifies the number of rows to set, and dstPitch specifies the number of bytes 
between each row. The dstDevice pointer and dstPitch offset must be four byte 
aligned. This function performs fastest when the pitch is one that has been passed back 
by cuMemAllocPitch().
CUresult cuMemsetD2D32Async (CUdeviceptr dstDevice, size_t dstPitch, unsigned int ui, size_t Width, size_t Height, CUstream hStream)

Sets device memory.

Parameters

dstDevice
  - Destination device pointer
dstPitch
  - Pitch of destination device pointer
ui
  - Value to set
Width
  - Width of row
Height
  - Number of rows
hStream
  - Stream identifier

See also memset synchronization details.
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Sets the 2D memory range of Width 32-bit values to the specified value \( \text{ui} \). \( \text{Height} \) specifies the number of rows to set, and \( \text{dstPitch} \) specifies the number of bytes between each row. The \( \text{dstDevice} \) pointer and \( \text{dstPitch} \) offset must be four byte aligned. This function performs fastest when the pitch is one that has been passed back by \text{cuMemAllocPitch}().

- Note that this function may also return error codes from previous, asynchronous launches.
- See also memset synchronization details.
- This function uses standard default stream semantics.

CUresult cuMemsetD2D8 (CUdeviceptr dstDevice, size_t \text{dstPitch}, unsigned char \text{uc}, size_t Width, size_t Height)
Initializes device memory.

Parameters
dstDevice
- Destination device pointer
dstPitch
  - Pitch of destination device pointer

uc
  - Value to set

Width
  - Width of row

Height
  - Number of rows

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Sets the 2D memory range of Width 8-bit values to the specified value uc. Height specifies the number of rows to set, and dstPitch specifies the number of bytes between each row. This function performs fastest when the pitch is one that has been passed back by cuMemAllocPitch().

Note that this function may also return error codes from previous, asynchronous launches.

See also: memset synchronization details.

See also:

CUresult cuMemsetD2D8Async (CUdeviceptr dstDevice, size_t dstPitch, unsigned char uc, size_t Width, size_t Height, CUstream hStream)

Sets device memory.

Parameters

dstDevice
  - Destination device pointer
dstPitch
  - Pitch of destination device pointer
uc
  - Value to set
Width
  - Width of row
Height
  - Number of rows
hStream
  - Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Sets the 2D memory range of Width 8-bit values to the specified value uc. Height specifies the number of rows to set, and dstPitch specifies the number of bytes between each row. This function performs fastest when the pitch is one that has been passed back by cuMemAllocPitch().

- Note that this function may also return error codes from previous, asynchronous launches.
- See also memset synchronization details.
- This function uses standard default stream semantics.

**CUresult cuMemsetD32 (CUdeviceptr dstDevice, unsigned int ui, size_t N)**

Initializes device memory.

**Parameters**

- **dstDevice**
  - Destination device pointer
- **ui**
  - Value to set
- **N**
  - Number of elements

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

**Description**

Sets the memory range of \( N \) 32-bit values to the specified value \( ui \). The \( dstDevice \) pointer must be four byte aligned.

- Note that this function may also return error codes from previous, asynchronous launches.
- See also `memset` synchronization details.

CUresult cuMemsetD32Async (CUdeviceptr dstDevice, unsigned int ui, size_t N, CUstream hStream)
Sets device memory.

Parameters

dstDevice
  - Destination device pointer
ui
  - Value to set
N
  - Number of elements
hStream
  - Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Sets the memory range of $N$ 32-bit values to the specified value $ui$. The $dstDevice$ pointer must be four byte aligned.

- Note that this function may also return error codes from previous, asynchronous launches.
- See also memset synchronization details.
- This function uses standard default stream semantics.

uc
- Value to set

N
- Number of elements

hStream
- Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Sets the memory range of N 8-bit values to the specified value uc.

- Note that this function may also return error codes from previous, asynchronous launches.
- See also memset synchronization details.
- This function uses standard default stream semantics.

CUresult cuMipmappedArrayCreate (CUmipmappedArray *pHandle, const CUDA_ARRAY3D_DESCRIPTOR *pMipmappedArrayDesc, unsigned int numMipmapLevels)

Creates a CUDA mipmapped array.

Parameters

pHandle
- Returned mipmapped array

pMipmappedArrayDesc
- Mipmapped array descriptor

numMipmapLevels
- Number of mipmap levels

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY,
CUDA_ERROR_UNKNOWN

Description

Creates a CUDA mipmapped array according to the CUDA_ARRAY3D_DESCRIPTOR structure pMipmappedArrayDesc and returns a handle to the new CUDA mipmapped array in *pHandle. numMipmapLevels specifies the number of mipmap levels to be allocated. This value is clamped to the range \([1, 1 + \text{floor}(\log_2(\max(\text{width}, \text{height}, \text{depth}))))\].
The `CUDA_ARRAY3D_DESCRIPTOR` is defined as:

```c
typedef struct {
    unsigned int Width;
    unsigned int Height;
    unsigned int Depth;
    CUarray_format Format;
    unsigned int NumChannels;
    unsigned int Flags;
} CUDA_ARRAY3D_DESCRIPTOR;
```

where:

- **Width**, **Height**, and **Depth** are the width, height, and depth of the CUDA array (in elements); the following types of CUDA arrays can be allocated:
  - A 1D mipmapped array is allocated if **Height** and **Depth** extents are both zero.
  - A 2D mipmapped array is allocated if only **Depth** extent is zero.
  - A 3D mipmapped array is allocated if all three extents are non-zero.
  - A 1D layered CUDA mipmapped array is allocated if only **Height** is zero and the **CUDA_ARRAY3D_LAYERED** flag is set. Each layer is a 1D array. The number of layers is determined by the depth extent.
  - A 2D layered CUDA mipmapped array is allocated if all three extents are non-zero and the **CUDA_ARRAY3D_LAYERED** flag is set. Each layer is a 2D array. The number of layers is determined by the depth extent.
  - A cubemap CUDA mipmapped array is allocated if all three extents are non-zero and the **CUDA_ARRAY3D_CUBEMAP** flag is set. **Width** must be equal to **Height**, and **Depth** must be six. A cubemap is a special type of 2D layered CUDA array, where the six layers represent the six faces of a cube. The order of the six layers in memory is the same as that listed in **CUarray_cubemap_face**.
  - A cubemap layered CUDA mipmapped array is allocated if all three extents are non-zero, and both, **CUDA_ARRAY3D_CUBEMAP** and **CUDA_ARRAY3D_LAYERED** flags are set. **Width** must be equal to **Height**, and **Depth** must be a multiple of six. A cubemap layered CUDA array is a special type of 2D layered CUDA array that consists of a collection of cubemaps. The first six layers represent the first cubemap, the next six layers form the second cubemap, and so on.

- **Format** specifies the format of the elements; **CUarray_format** is defined as:

```c
typedef enum CUarray_format_enum {
    CU_AD_FORMAT_UNSIGNED_INT8 = 0x01,
    CU_AD_FORMAT_UNSIGNED_INT16 = 0x02,
    CU_AD_FORMAT_UNSIGNED_INT32 = 0x03,
    CU_AD_FORMAT_SIGNED_INT8 = 0x08,
    CU_AD_FORMAT_SIGNED_INT16 = 0x09,
    CU_AD_FORMAT_SIGNED_INT32 = 0x0a,
    CU_AD_FORMAT_HALF = 0x10,
    CU_AD_FORMAT_FLOAT = 0x20
} CUarray_format;
```

- **NumChannels** specifies the number of packed components per CUDA array element; it may be 1, 2, or 4;
Flags may be set to

- **CUDA_ARRAY3D_LAYERED** to enable creation of layered CUDA mipmapped arrays. If this flag is set, Depth specifies the number of layers, not the depth of a 3D array.
- **CUDA_ARRAY3D_SURFACE_LDST** to enable surface references to be bound to individual mipmap levels of the CUDA mipmapped array. If this flag is not set, cuSurfRefSetArray will fail when attempting to bind a mipmap level of the CUDA mipmapped array to a surface reference.
- **CUDA_ARRAY3D_CUBEMAP** to enable creation of mipmapped cubemaps. If this flag is set, Width must be equal to Height, and Depth must be six. If the CUDA_ARRAY3D_LAYERED flag is also set, then Depth must be a multiple of six.
- **CUDA_ARRAY3D_TEXTURE_GATHER** to indicate that the CUDA mipmapped array will be used for texture gather. Texture gather can only be performed on 2D CUDA mipmapped arrays.

*Width, Height and Depth must meet certain size requirements as listed in the following table. All values are specified in elements. Note that for brevity’s sake, the full name of the device attribute is not specified. For ex., TEXTURE1D_MIPMAPPED_WIDTH refers to the device attribute CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_MIPMAPPED_WIDTH.*

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuMipmappedArrayDestroy, cuMipmappedArrayGetLevel, cuArrayCreate, cudaMallocMipmappedArray

CUresult cuMipmappedArrayDestroy
(CUmipmappedArray hMipmappedArray)

Destroys a CUDA mipmapped array.

Parameters

hMipmappedArray
- Mipmapped array to destroy

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ARRAY_IS_MAPPED, CUDA_ERROR_CONTEXT_IS_DESTROYED

Description

Destroys the CUDA mipmapped array hMipmappedArray.

Note that this function may also return error codes from previous, asynchronous launches.
See also:
cuMipmappedArrayCreate, cuMipmappedArrayGetLevel, cuArrayCreate, cudaFreeMipmappedArray

CUresult cuMipmappedArrayGetLevel (CUarray *pLevelArray, CUmipmappedArray hMipmappedArray, unsigned int level)
Gets a mipmap level of a CUDA mipmapped array.

Parameters
pLevelArray
- Returned mipmap level CUDA array
hMipmappedArray
- CUDA mipmapped array
level
- Mipmap level

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Returns in pLevelArray a CUDA array that represents a single mipmap level of the CUDA mipmapped array hMipmappedArray.

If level is greater than the maximum number of levels in this mipmapped array, CUDA_ERROR_INVALID_VALUE is returned.

Note that this function may also return error codes from previous, asynchronous launches.

cuMipmappedArrayCreate, cuMipmappedArrayDestroy, cuArrayCreate, cudaGetMipmappedArrayLevel
5.12. Unified Addressing

This section describes the unified addressing functions of the low-level CUDA driver application programming interface.

Overview

CUDA devices can share a unified address space with the host. For these devices there is no distinction between a device pointer and a host pointer -- the same pointer value may be used to access memory from the host program and from a kernel running on the device (with exceptions enumerated below).

Supported Platforms

Whether or not a device supports unified addressing may be queried by calling cuDeviceGetAttribute() with the device attribute CU_DEVICE_ATTRIBUTE_UNIFIED_ADDRESSING.

Unified addressing is automatically enabled in 64-bit processes

Looking Up Information from Pointer Values

It is possible to look up information about the memory which backs a pointer value. For instance, one may want to know if a pointer points to host or device memory. As another example, in the case of device memory, one may want to know on which CUDA device the memory resides. These properties may be queried using the function cuPointerGetAttribute()

Since pointers are unique, it is not necessary to specify information about the pointers specified to the various copy functions in the CUDA API. The function cuMemcpy() may be used to perform a copy between two pointers, ignoring whether they point to host or device memory (making cuMemcpyHtoD(), cuMemcpyDtoD(), and cuMemcpyDtoH() unnecessary for devices supporting unified addressing). For multidimensional copies, the memory type CU_MEMORYTYPE_UNIFIED may be used to specify that the CUDA driver should infer the location of the pointer from its value.

Automatic Mapping of Host Allocated Host Memory

All host memory allocated in all contexts using cuMemAllocHost() and cuMemHostAlloc() is always directly accessible from all contexts on all devices that support unified addressing. This is the case regardless of whether or not the flags CU_MEMHOSTALLOC_PORTABLE and CU_MEMHOSTALLOC_DEVICEMAP are specified.

The pointer value through which allocated host memory may be accessed in kernels on all devices that support unified addressing is the same as the pointer value through which that memory is accessed on the host, so it is not necessary to call cuMemHostGetDevicePointer() to get the device pointer for these allocations.
Note that this is not the case for memory allocated using the flag \texttt{CU_MEMHOSTALLOC_WRITECOMBINED}, as discussed below.

**Automatic Registration of Peer Memory**

Upon enabling direct access from a context that supports unified addressing to another peer context that supports unified addressing using \texttt{cuCtxEnablePeerAccess()} all memory allocated in the peer context using \texttt{cuMemAlloc()} and \texttt{cuMemAllocPitch()} will immediately be accessible by the current context. The device pointer value through which any peer memory may be accessed in the current context is the same pointer value through which that memory may be accessed in the peer context.

**Exceptions, Disjoint Addressing**

Not all memory may be accessed on devices through the same pointer value through which they are accessed on the host. These exceptions are host memory registered using \texttt{cuMemHostRegister()} and host memory allocated using the flag \texttt{CU_MEMHOSTALLOC_WRITECOMBINED}. For these exceptions, there exists a distinct host and device address for the memory. The device address is guaranteed to not overlap any valid host pointer range and is guaranteed to have the same value across all contexts that support unified addressing.

This device address may be queried using \texttt{cuMemHostGetDevicePointer()} when a context using unified addressing is current. Either the host or the unified device pointer value may be used to refer to this memory through \texttt{cuMemcpy()} and similar functions using the \texttt{CU_MEMORYTYPE_UNIFIED} memory type.

\texttt{CUresult cuMemAdvise (CUdeviceptr devPtr, size_t count, CUmem_advice advice, CUdevice device)}

Advise about the usage of a given memory range.

**Parameters**

- \texttt{devPtr} - Pointer to memory to set the advice for
- \texttt{count} - Size in bytes of the memory range
- \texttt{advice} - Advice to be applied for the specified memory range
- \texttt{device} - Device to apply the advice for

**Returns**

- \texttt{CUDA_SUCCESS}
- \texttt{CUDA_ERROR_INVALID_VALUE}
- \texttt{CUDA_ERROR_INVALID_DEVICE}
Description

Advise the Unified Memory subsystem about the usage pattern for the memory range starting at `devPtr` with a size of `count` bytes. The start address and end address of the memory range will be rounded down and rounded up respectively to be aligned to CPU page size before the advice is applied. The memory range must refer to managed memory allocated via `cuMemAllocManaged` or declared via `__managed__` variables. The memory range could also refer to system-allocated pageable memory provided it represents a valid, host-accessible region of memory and all additional constraints imposed by advice as outlined below are also satisfied. Specifying an invalid system-allocated pageable memory range results in an error being returned.

The `advice` parameter can take the following values:

- **CU_MEM_ADVISE_SET_READ_MOSTLY**: This implies that the data is mostly going to be read from and only occasionally written to. Any read accesses from any processor to this region will create a read-only copy of at least the accessed pages in that processor's memory. Additionally, if `cuMemPrefetchAsync` is called on this region, it will create a read-only copy of the data on the destination processor. If any processor writes to this region, all copies of the corresponding page will be invalidated except for the one where the write occurred. The `device` argument is ignored for this advice. Note that for a page to be read-duplicated, the accessing processor must either be the CPU or a GPU that has a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS`. Also, if a context is created on a device that does not have the device attribute `CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS` set, then read-duplication will not occur until all such contexts are destroyed. If the memory region refers to valid system-allocated pageable memory, then the accessing device must have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS` for a read-only copy to be created on that device. Note however that if the accessing device also has a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS_USES_HOST_PAGE_TABLES`, then setting this advice will not create a read-only copy when that device accesses this memory region.

- **CU_MEM_ADVISE_UNSET_READ_MOSTLY**: Undoes the effect of `CU_MEM_ADVISE_SET_READ_MOSTLY` and also prevents the Unified Memory driver from attempting heuristic read-duplication on the memory range. Any read-duplicated copies of the data will be collapsed into a single copy. The location for the collapsed copy will be the preferred location if the page has a preferred location and one of the read-duplicated copies was resident at that location. Otherwise, the location chosen is arbitrary.

- **CU_MEM_ADVISE_SET_PREFERRED_LOCATION**: This advice sets the preferred location for the data to be the memory belonging to `device`. Passing
in CU_DEVICE_CPU for device sets the preferred location as host memory. If device is a GPU, then it must have a non-zero value for the device attribute 
CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS. Setting the preferred location does not cause data to migrate to that location immediately. Instead, it guides the migration policy when a fault occurs on that memory region. If the data is already in its preferred location and the faultering processor can establish a mapping without requiring the data to be migrated, then data migration will be avoided. On the other hand, if the data is not in its preferred location or if a direct mapping cannot be established, then it will be migrated to the processor accessing it. It is important to note that setting the preferred location does not prevent data prefetching done using cuMemPrefetchAsync. Having a preferred location can override the page thrash detection and resolution logic in the Unified Memory driver. Normally, if a page is detected to be constantly thrashing between for example host and device memory, the page may eventually be pinned to host memory by the Unified Memory driver. But if the preferred location is set as device memory, then the page will continue to thrash indefinitely. If 
CU_MEM_ADVISE_SET_READ_MOSTLY is also set on this memory region or any subset of it, then the policies associated with that advice will override the policies of this advice, unless read accesses from device will not result in a read-only copy being created on that device as outlined in description for the advice 
CU_MEM_ADVISE_SET_READ_MOSTLY. If the memory region refers to valid system-allocated pageable memory, then device must have a non-zero value for the device attribute CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS. Additionally, if device has a non-zero value for the device attribute 
CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS_USES_HOST_PAGE_TABLES, then this call has no effect. Note however that this behavior may change in the future.

- **CU_MEM_ADVISE_UNSET_PREFERRED_LOCATION**: Undoes the effect of 
CU_MEM_ADVISE_SET_PREFERRED_LOCATION and changes the preferred location to none.

- **CU_MEM_ADVISE_SET_ACCESSED_BY**: This advice implies that the data will be accessed by device. Passing in CU_DEVICE_CPU for device will set the advice for the CPU. If device is a GPU, then the device attribute 
CUDEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS must be non-zero. This advice does not cause data migration and has no impact on the location of the data per se. Instead, it causes the data to always be mapped in the specified processor’s page tables, as long as the location of the data permits a mapping to be established. If the data gets migrated for any reason, the mappings are updated accordingly. This advice is recommended in scenarios where data locality is not important, but avoiding faults is. Consider for example a system containing multiple GPUs with peer-to-peer access enabled, where the data located on one GPU is occasionally accessed by peer GPUs. In such
scenarios, migrating data over to the other GPUs is not as important because the accesses are infrequent and the overhead of migration may be too high. But preventing faults can still help improve performance, and so having a mapping set up in advance is useful. Note that on CPU access of this data, the data may be migrated to host memory because the CPU typically cannot access device memory directly. Any GPU that had the `CU_MEM_ADVISE_SET_ACCESSSED_BY` flag set for this data will now have its mapping updated to point to the page in host memory. If `CU_MEM_ADVISE_SET_READ_MOSTLY` is also set on this memory region or any subset of it, then the policies associated with that advice will override the policies of this advice. Additionally, if the preferred location of this memory region or any subset of it is also device, then the policies associated with `CU_MEM_ADVISE_SET_PREFERRED_LOCATION` will override the policies of this advice. If the memory region refers to valid system-allocated pageable memory, then device must have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS`. Additionally, if device has a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS_USES_HOST_PAGE_TABLES`, then this call has no effect.

- `CU_MEM_ADVISE_UNSET_ACCESSSED_BY`: Undoes the effect of `CU_MEM_ADVISE_SET_ACCESSSED_BY`. Any mappings to the data from device may be removed at any time causing accesses to result in non-fatal page faults. If the memory region refers to valid system-allocated pageable memory, then device must have a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS`. Additionally, if device has a non-zero value for the device attribute `CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS_USES_HOST_PAGE_TABLES`, then this call has no effect.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

CUresult cuMemPrefetchAsync (CUdeviceptr devPtr, size_t count, CUdevice dstDevice, CUstream hStream)
Prefetches memory to the specified destination device.

Parameters

devPtr
- Pointer to be prefetched
count
- Size in bytes
dstDevice
- Destination device to prefetch to
hStream
- Stream to enqueue prefetch operation

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description
Prefetches memory to the specified destination device. devPtr is the base device pointer of the memory to be prefetched and dstDevice is the destination device. count specifies the number of bytes to copy. hStream is the stream in which the operation is enqueued. The memory range must refer to managed memory allocated via cuMemAllocManaged or declared via __managed__ variables.

Passing in CU_DEVICE_CPU for dstDevice will prefetch the data to host memory. If dstDevice is a GPU, then the device attribute CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS must be non-zero. Additionally, hStream must be associated with a device that has a non-zero value for the device attribute CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS.

The start address and end address of the memory range will be rounded down and rounded up respectively to be aligned to CPU page size before the prefetch operation is enqueued in the stream.

If no physical memory has been allocated for this region, then this memory region will be populated and mapped on the destination device. If there's insufficient memory to prefetch the desired region, the Unified Memory driver may evict pages from other cuMemAllocManaged allocations to host memory in order to make room. Device memory allocated using cuMemAlloc or cuArrayCreate will not be evicted.

By default, any mappings to the previous location of the migrated pages are removed and mappings for the new location are only setup on dstDevice. The exact behavior
however also depends on the settings applied to this memory range via `cuMemAdvise` as described below:

If `CU_MEM_ADVISE_SET_READ_MOSTLY` was set on any subset of this memory range, then that subset will create a read-only copy of the pages on `dstDevice`.

If `CU_MEM_ADVISE_SET_PREFERRED_LOCATION` was called on any subset of this memory range, then the pages will be migrated to `dstDevice` even if `dstDevice` is not the preferred location of any pages in the memory range.

If `CU_MEM_ADVISE_SET_ACCESSED_BY` was called on any subset of this memory range, then mappings to those pages from all the appropriate processors are updated to refer to the new location if establishing such a mapping is possible. Otherwise, those mappings are cleared.

Note that this API is not required for functionality and only serves to improve performance by allowing the application to migrate data to a suitable location before it is accessed. Memory accesses to this range are always coherent and are allowed even when the data is actively being migrated.

Note that this function is asynchronous with respect to the host and all work on other devices.

- Note that this function may also return error codes from previous, asynchronous launches.
- This function exhibits asynchronous behavior for most use cases.
- This function uses standard default stream semantics.

```c
CUresult cuMemRangeGetAttribute (void *data, size_t dataSize, CUmem_range_attribute attribute, CUdeviceptr devPtr, size_t count)
```

Query an attribute of a given memory range.

**Parameters**

`data`
- A pointer to a memory location where the result of each attribute query will be written to.
dataSize
- Array containing the size of data

attribute
- The attribute to query

devPtr
- Start of the range to query

count
- Size of the range to query

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description
Query an attribute about the memory range starting at devPtr with a size of count bytes. The memory range must refer to managed memory allocated via cuMemAllocManaged or declared via __managed__ variables.

The attribute parameter can take the following values:

- **CU_MEM_RANGE_ATTRIBUTE_READ_MOSTLY**: If this attribute is specified, data will be interpreted as a 32-bit integer, and dataSize must be 4. The result returned will be 1 if all pages in the given memory range have read-duplication enabled, or 0 otherwise.

- **CU_MEM_RANGE_ATTRIBUTE_PREFERRED_LOCATION**: If this attribute is specified, data will be interpreted as a 32-bit integer, and dataSize must be 4. The result returned will be a GPU device id if all pages in the memory range have that GPU as their preferred location, or it will be CU_DEVICE_CPU if all pages in the memory range have the CPU as their preferred location, or it will be CU_DEVICE_INVALID if either all the pages don't have the same preferred location or some of the pages don't have a preferred location at all. Note that the actual location of the pages in the memory range at the time of the query may be different from the preferred location.

- **CU_MEM_RANGE_ATTRIBUTE_ACCESSED_BY**: If this attribute is specified, data will be interpreted as an array of 32-bit integers, and dataSize must be a non-zero multiple of 4. The result returned will be a list of device ids that had CU_MEM_ADVISE_SET_ACCESSED_BY set for that entire memory range. If any device does not have that advice set for the entire memory range, that device will not be included. If data is larger than the number of devices that have that advice set for that memory range, CU_DEVICE_INVALID will be returned in all the extra space provided. For ex., if dataSize is 12 (i.e. data has 3 elements) and only device 0 has the advice set, then the result returned will be { 0, CU_DEVICE_INVALID, CU_DEVICE_INVALID }. If data is smaller than the number of devices that have that advice set, then only as many devices will be
returned as can fit in the array. There is no guarantee on which specific devices will be returned, however.

- **CU_MEM_RANGE_ATTRIBUTE_LAST_PREFETCH_LOCATION**: If this attribute is specified, `data` will be interpreted as a 32-bit integer, and `dataSize` must be 4. The result returned will be the last location to which all pages in the memory range were prefetched explicitly via `cuMemPrefetchAsync`. This will either be a GPU id or `CU_DEVICE_CPU` depending on whether the last location for prefetch was a GPU or the CPU respectively. If any page in the memory range was never explicitly prefetched or if all pages were not prefetched to the same location, `CU_DEVICE_INVALID` will be returned. Note that this simply returns the last location that the application requested to prefetch the memory range to. It gives no indication as to whether the prefetch operation to that location has completed or even begun.

  - Note that this function may also return error codes from previous, asynchronous launches.
  - This function exhibits asynchronous behavior for most use cases.
  - This function uses standard default stream semantics.

- `cudaMemRangeGetAttribute`

```c
CUresult cuMemRangeGetAttributes (void **data, size_t *dataSizes, CUmem_range_attribute *attributes, size_t numAttributes, CUdeviceptr devPtr, size_t count)
```

Query attributes of a given memory range.

**Parameters**

- **data**
  - A two-dimensional array containing pointers to memory locations where the result of each attribute query will be written to.

- **dataSizes**
  - Array containing the sizes of each result

- **attributes**
  - An array of attributes to query (`numAttributes` and the number of attributes in this array should match)

- **numAttributes**
  - Number of attributes to query
devPtr
  - Start of the range to query
count
  - Size of the range to query

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_INVALID_DEVICE

Description
Query attributes of the memory range starting at devPtr with a size of count bytes. The memory range must refer to managed memory allocated via cuMemAllocManaged or declared via __managed__ variables. The attributes array will be interpreted to have numAttributes entries. The dataSizes array will also be interpreted to have numAttributes entries. The results of the query will be stored in data.

The list of supported attributes are given below. Please refer to cuMemRangeGetAttribute for attribute descriptions and restrictions.

- CU_MEM_RANGE_ATTRIBUTE_READ_MOSTLY
- CU_MEM_RANGE_ATTRIBUTE_PREFERRED_LOCATION
- CU_MEM_RANGE_ATTRIBUTE_ACCESSED_BY
- CU_MEM_RANGE_ATTRIBUTE_LAST_PREFETCH_LOCATION

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuMemRangeGetAttribute, cuMemAdvise cuMemPrefetchAsync, cudaMemRangeGetAttributes

CUresult cuPointerGetAttribute (void *data,
CUpointer_attribute attribute, CUdeviceptr ptr)
Returns information about a pointer.

Parameters
data
  - Returned pointer attribute value
attribute
- Pointer attribute to query

ptr
- Pointer

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

Description
The supported attributes are:

► CU_POINTER_ATTRIBUTE_CONTEXT:
Returns in *data the CUcontext in which ptr was allocated or registered. The type of data must be CUcontext *.

If ptr was not allocated by, mapped by, or registered with a CUcontext which uses unified virtual addressing then CUDA_ERROR_INVALID_VALUE is returned.

► CU_POINTER_ATTRIBUTE_MEMORY_TYPE:
Returns in *data the physical memory type of the memory that ptr addresses as a CUmemorytype enumerated value. The type of data must be unsigned int.

If ptr addresses device memory then *data is set to CU_MEMORYTYPE_DEVICE.
The particular CUdevice on which the memory resides is the CUdevice of the CUcontext returned by the CU_POINTER_ATTRIBUTE_CONTEXT attribute of ptr.

If ptr addresses host memory then *data is set to CU_MEMORYTYPE_HOST.

If ptr was not allocated by, mapped by, or registered with a CUcontext which uses unified virtual addressing then CUDA_ERROR_INVALID_VALUE is returned.

If the current CUcontext does not support unified virtual addressing then CUDA_ERROR_INVALID_CONTEXT is returned.

► CU_POINTER_ATTRIBUTE_DEVICE_POINTER:
Returns in *data the device pointer value through which ptr may be accessed by kernels running in the current CUcontext. The type of data must be CUdeviceptr *.

If there exists no device pointer value through which kernels running in the current CUcontext may access ptr then CUDA_ERROR_INVALID_VALUE is returned.

If there is no current CUcontext then CUDA_ERROR_INVALID_CONTEXT is returned.

Except in the exceptional disjoint addressing cases discussed below, the value returned in *data will equal the input value ptr.
CU_POINTER_ATTRIBUTE_HOST_POINTER:

Returns in *data the host pointer value through which ptr may be accessed by by the host program. The type of data must be void **. If there exists no host pointer value through which the host program may directly access ptr then CUDA_ERROR_INVALID_VALUE is returned.

Except in the exceptional disjoint addressing cases discussed below, the value returned in *data will equal the input value ptr.

CU_POINTER_ATTRIBUTE_P2P_TOKENS:

Returns in *data two tokens for use with the nv-p2p.h Linux kernel interface. data must be a struct of type CUDA_POINTER_ATTRIBUTE_P2P_TOKENS.

ptr must be a pointer to memory obtained from :cuMemAlloc(). Note that p2pToken and vaSpaceToken are only valid for the lifetime of the source allocation. A subsequent allocation at the same address may return completely different tokens. Querying this attribute has a side effect of setting the attribute CU_POINTER_ATTRIBUTE_SYNC_MEMOPS for the region of memory that ptr points to.

CU_POINTER_ATTRIBUTE_SYNC_MEMOPS:

A boolean attribute which when set, ensures that synchronous memory operations initiated on the region of memory that ptr points to will always synchronize. See further documentation in the section titled "API synchronization behavior" to learn more about cases when synchronous memory operations can exhibit asynchronous behavior.

CU_POINTER_ATTRIBUTE_BUFFER_ID:

Returns in *data a buffer ID which is guaranteed to be unique within the process. data must point to an unsigned long long.

ptr must be a pointer to memory obtained from a CUDA memory allocation API. Every memory allocation from any of the CUDA memory allocation APIs will have a unique ID over a process lifetime. Subsequent allocations do not reuse IDs from previous freed allocations. IDs are only unique within a single process.

CU_POINTER_ATTRIBUTE_IS_MANAGED:

Returns in *data a boolean that indicates whether the pointer points to managed memory or not.

CU_POINTER_ATTRIBUTE_DEVICE_ORDINAL:

Returns in *data an integer representing a device ordinal of a device against which the memory was allocated or registered.

Note that for most allocations in the unified virtual address space the host and device pointer for accessing the allocation will be the same. The exceptions to this are
user memory registered using `cuMemHostRegister`

- host memory allocated using `cuMemHostAlloc` with the `CU_MEMHOSTALLOC_WRITECOMBINED` flag. For these types of allocation there will exist separate, disjoint host and device addresses for accessing the allocation. In particular,
- The host address will correspond to an invalid unmapped device address (which will result in an exception if accessed from the device).
- The device address will correspond to an invalid unmapped host address (which will result in an exception if accessed from the host). For these types of allocations, querying `CU_POINTER_ATTRIBUTE_HOST_POINTER` and `CU_POINTER_ATTRIBUTE_DEVICE_POINTER` may be used to retrieve the host and device addresses from either address.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

- `cuPointerSetAttribute`, `cuMemAlloc`, `cuMemFree`, `cuMemAllocHost`, `cuMemFreeHost`, `cuMemHostAlloc`, `cuMemHostRegister`, `cuMemHostUnregister`, `cudaPointerGetAttributes`

###CUresult cuPointerGetAttributes (unsigned int numAttributes, CUpointer_attribute *attributes, void **data, CUdeviceptr ptr)

Returns information about a pointer.

**Parameters**

- **numAttributes**
  - Number of attributes to query
- **attributes**
  - An array of attributes to query (numAttributes and the number of attributes in this array should match)
- **data**
  - A two-dimensional array containing pointers to memory locations where the result of each attribute query will be written to.
- **ptr**
  - Pointer to query
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_INVALID_DEVICE

Description

The supported attributes are (refer to cuPointerGetAttribute for attribute descriptions
and restrictions):
- CU_POINTER_ATTRIBUTE_CONTEXT
- CU_POINTER_ATTRIBUTE_MEMORY_TYPE
- CU_POINTER_ATTRIBUTE_DEVICE_POINTER
- CU_POINTER_ATTRIBUTE_HOST_POINTER
- CU_POINTER_ATTRIBUTE_SYNC_MEMOPS
- CU_POINTER_ATTRIBUTE_BUFFER_ID
- CU_POINTER_ATTRIBUTE_IS_MANAGED
- CU_POINTER_ATTRIBUTE_DEVICE_ORDINAL

Unlike cuPointerGetAttribute, this function will not return an error when the \texttt{ptr}
encountered is not a valid CUDA pointer. Instead, the attributes are assigned default
NULL values and CUDA_SUCCESS is returned.

If \texttt{ptr} was not allocated by, mapped by, or registered with a \texttt{CUcontext} which uses UVA
(Unified Virtual Addressing), CUDA_ERROR_INVALID_CONTEXT is returned.

\begin{tcolorbox}[colback=green!5!white,colframe=green!75!black]

Note that this function may also return error codes from previous, asynchronous
launches.

\end{tcolorbox}

See also:

cuPointerGetAttribute, cuPointerSetAttribute, cudaPointerGetAttributes

\textbf{CUresult cuPointerSetAttribute (const void *value,}
\textbf{CUpointer_attribute attribute, CUdeviceptr ptr)}

Set attributes on a previously allocated memory region.

Parameters

\textbf{value}
- Pointer to memory containing the value to be set

\textbf{attribute}
- Pointer attribute to set
ptr
- Pointer to a memory region allocated using CUDA memory allocation APIs

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_DEVICE

**Description**

The supported attributes are:

- **CU_POINTER_ATTRIBUTE_SYNC_MEMOPS:**

  A boolean attribute that can either be set (1) or unset (0). When set, the region of memory that `ptr` points to is guaranteed to always synchronize memory operations that are synchronous. If there are some previously initiated synchronous memory operations that are pending when this attribute is set, the function does not return until those memory operations are complete. See further documentation in the section titled “API synchronization behavior” to learn more about cases when synchronous memory operations can exhibit asynchronous behavior. `value` will be considered as a pointer to an unsigned integer to which this attribute is to be set.

Note that this function may also return error codes from previous, asynchronous launches.

### 5.13. Stream Management

This section describes the stream management functions of the low-level CUDA driver application programming interface.
CUresult cuStreamAddCallback (CUstream hStream, CUstreamCallback callback, void *userData, unsigned int flags)

Add a callback to a compute stream.

Parameters

hStream
- Stream to add callback to

callback
- The function to call once preceding stream operations are complete

userData
- User specified data to be passed to the callback function

flags
- Reserved for future use, must be 0

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_SUPPORTED

Description

This function is slated for eventual deprecation and removal. If you do not require
the callback to execute in case of a device error, consider using cuLaunchHostFunc.
Additionally, this function is not supported with cuStreamBeginCapture and
cuStreamEndCapture, unlike cuLaunchHostFunc.

Adds a callback to be called on the host after all currently enqueued items in the stream
have completed. For each cuStreamAddCallback call, the callback will be executed
exactly once. The callback will block later work in the stream until it is finished.

The callback may be passed CUDA_SUCCESS or an error code. In the event of a device
error, all subsequently executed callbacks will receive an appropriate CUresult.

Callbacks must not make any CUDA API calls. Attempting to use a CUDA API
will result in CUDA_ERROR_NOT_PERMITTED. Callbacks must not perform any
synchronization that may depend on outstanding device work or other callbacks that
are not mandated to run earlier. Callbacks without a mandated order (in independent
streams) execute in undefined order and may be serialized.

For the purposes of Unified Memory, callback execution makes a number of guarantees:
The callback stream is considered idle for the duration of the callback. Thus, for example, a callback may always use memory attached to the callback stream.

The start of execution of a callback has the same effect as synchronizing an event recorded in the same stream immediately prior to the callback. It thus synchronizes streams which have been "joined" prior to the callback.

Adding device work to any stream does not have the effect of making the stream active until all preceding host functions and stream callbacks have executed. Thus, for example, a callback might use global attached memory even if work has been added to another stream, if the work has been ordered behind the callback with an event.

Completion of a callback does not cause a stream to become active except as described above. The callback stream will remain idle if no device work follows the callback, and will remain idle across consecutive callbacks without device work in between. Thus, for example, stream synchronization can be done by signaling from a callback at the end of the stream.

- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuStreamCreate, cuStreamQuery, cuStreamSynchronize, cuStreamWaitEvent, cuStreamDestroy, cuMemAllocManaged, cuStreamAttachMemAsync, cuStreamLaunchHostFunc, cudaStreamAddCallback

CUresult cuStreamAttachMemAsync (CUstream hStream, CUdeviceptr dptr, size_t length, unsigned int flags)

Attach memory to a stream asynchronously.

Parameters

hStream
- Stream in which to enqueue the attach operation
dptr
- Pointer to memory (must be a pointer to managed memory or to a valid host-accessible region of system-allocated pageable memory)
length
- Length of memory
flags
- Must be one of CUmemAttach_flags
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_SUPPORTED

Description

Enqueues an operation in hStream to specify stream association of length bytes of memory starting from dptr. This function is a stream-ordered operation, meaning that it is dependent on, and will only take effect when, previous work in stream has completed. Any previous association is automatically replaced.

dptr must point to one of the following types of memories:

- managed memory declared using the __managed__ keyword or allocated with cuMemAllocManaged.
- a valid host-accessible region of system-allocated pageable memory.
  This type of memory may only be specified if the device associated with the stream reports a non-zero value for the device attribute CU_DEVICE_ATTRIBUTE_PAGEABLE_MEMORY_ACCESS.

For managed allocations, length must be either zero or the entire allocation's size. Both indicate that the entire allocation's stream association is being changed. Currently, it is not possible to change stream association for a portion of a managed allocation.

For pageable host allocations, length must be non-zero.

The stream association is specified using flags which must be one of CUMemAttach_flags. If the CU_MEM_ATTACH_GLOBAL flag is specified, the memory can be accessed by any stream on any device. If the CU_MEM_ATTACH_HOST flag is specified, the program makes a guarantee that it won't access the memory on the device from any stream on a device that has a zero value for the device attribute CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS.

If the CU_MEM_ATTACH_SINGLE flag is specified and hStream is associated with a device that has a zero value for the device attribute CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS, the program makes a guarantee that it will only access the memory on the device from hStream. It is illegal to attach singly to the NULL stream, because the NULL stream is a virtual global stream and not a specific stream. An error will be returned in this case.

When memory is associated with a single stream, the Unified Memory system will allow CPU access to this memory region so long as all operations in hStream have completed, regardless of whether other streams are active. In effect, this constrains exclusive ownership of the managed memory region by an active GPU to per-stream activity instead of whole-GPU activity.
Accessing memory on the device from streams that are not associated with it will produce undefined results. No error checking is performed by the Unified Memory system to ensure that kernels launched into other streams do not access this region.

It is a program’s responsibility to order calls to `cuStreamAttachMemAsync` via events, synchronization or other means to ensure legal access to memory at all times. Data visibility and coherency will be changed appropriately for all kernels which follow a stream-association change.

If `hStream` is destroyed while data is associated with it, the association is removed and the association reverts to the default visibility of the allocation as specified at `cuMemAllocManaged`. For `__managed__` variables, the default association is always `CU_MEM_ATTACH_GLOBAL`. Note that destroying a stream is an asynchronous operation, and as a result, the change to default association won’t happen until all work in the stream has completed.

- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuStreamCreate, cuStreamQuery, cuStreamSynchronize, cuStreamWaitEvent, cuStreamDestroy, cuMemAllocManaged, cudaStreamAttachMemAsync`

**CResult cuStreamBeginCapture (CUstream hStream, CUstreamCaptureMode mode)**

Begins graph capture on a stream.

**Parameters**

- **hStream**
  - Stream in which to initiate capture

- **mode**
  - Controls the interaction of this capture sequence with other API calls that are potentially unsafe. For more details see `cuThreadExchangeStreamCaptureMode`.

**Returns**

`CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE`
Description

Begin graph capture on \texttt{hStream}. When a stream is in capture mode, all operations pushed into the stream will not be executed, but will instead be captured into a graph, which will be returned via \texttt{cuStreamEndCapture}. Capture may not be initiated if \texttt{stream} is \texttt{CU\_STREAM\_LEGACY}. Capture must be ended on the same stream in which it was initiated, and it may only be initiated if the stream is not already in capture mode. The capture mode may be queried via \texttt{cuStreamIsCapturing}. A unique id representing the capture sequence may be queried via \texttt{cuStreamGetCaptureInfo}.

If \texttt{mode} is not \texttt{CU\_STREAM\_CAPTURE\_MODE\_RELAXED}, \texttt{cuStreamEndCapture} must be called on this stream from the same thread.

- **Kernels captured using this API must not use texture and surface references. Reading or writing through any texture or surface reference is undefined behavior. This restriction does not apply to texture and surface objects.**

- **Note that this function may also return error codes from previous, asynchronous launches.**

See also:

\texttt{cuStreamCreate, cuStreamIsCapturing, cuStreamEndCapture, cuThreadExchangeStreamCaptureMode}

\textbf{CUresult cuStreamCreate (CUstream *phStream, unsigned int Flags)}

Create a stream.

**Parameters**

- **phStream**
  - Returned newly created stream
- **Flags**
  - Parameters for stream creation

**Returns**

\texttt{CUDA\_SUCCESS, CUDA\_ERROR\_DEINITIALIZED, CUDA\_ERROR\_NOT\_INITIALIZED, CUDA\_ERROR\_INVALID\_CONTEXT, CUDA\_ERROR\_INVALID\_VALUE, CUDA\_ERROR\_OUT\_OF\_MEMORY}
Description

Creates a stream and returns a handle in `phStream`. The `Flags` argument determines behaviors of the stream. Valid values for `Flags` are:

- **CU_STREAM_DEFAULT**: Default stream creation flag.
- **CU_STREAM_NON_BLOCKING**: Specifies that work running in the created stream may run concurrently with work in stream 0 (the NULL stream), and that the created stream should perform no implicit synchronization with stream 0.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

### CResult cuStreamCreateWithPriority (CUstream *phStream, unsigned int flags, int priority)

Create a stream with the given priority.

**Parameters**

- **phStream**
  - Returned newly created stream
- **flags**
  - Flags for stream creation. See `cuStreamCreate` for a list of valid flags
- **priority**
  - Stream priority. Lower numbers represent higher priorities. See `cuCtxGetStreamPriorityRange` for more information about meaningful stream priorities that can be passed.

**Returns**

- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_VALUE`, `CUDA_ERROR_OUT_OF_MEMORY`
Description

Creates a stream with the specified priority and returns a handle in `hStream`. This API alters the scheduler priority of work in the stream. Work in a higher priority stream may preempt work already executing in a low priority stream.

`priority` follows a convention where lower numbers represent higher priorities. '0' represents default priority. The range of meaningful numerical priorities can be queried using `cuCtxGetStreamPriorityRange`. If the specified priority is outside the numerical range returned by `cuCtxGetStreamPriorityRange`, it will automatically be clamped to the lowest or the highest number in the range.

- Note that this function may also return error codes from previous, asynchronous launches.
- Stream priorities are supported only on GPUs with compute capability 3.5 or higher.
- In the current implementation, only compute kernels launched in priority streams are affected by the stream's priority. Stream priorities have no effect on host-to-device and device-to-host memory operations.

See also:

**CUresult cuStreamDestroy (CUstream hStream)**

Destroys a stream.

Parameters

- `hStream` - Stream to destroy

Returns

- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description

Destroys the stream specified by `hStream`. 
In case the device is still doing work in the stream \texttt{hStream} when \texttt{cuStreamDestroy()} is called, the function will return immediately and the resources associated with \texttt{hStream} will be released automatically once the device has completed all work in \texttt{hStream}.

\begin{quote}
Note that this function may also return error codes from previous, asynchronous launches.
\end{quote}

See also:
\texttt{cuStreamCreate, cuStreamWaitEvent, cuStreamQuery, cuStreamSynchronize, cuStreamAddCallback, cudaStreamDestroy}

\begin{description}
\item[CUresult cuStreamEndCapture (CUstream hStream, CUgraph *phGraph)]
\end{description}

Ends capture on a stream, returning the captured graph.

\begin{description}
\item[Parameters]
\begin{itemize}
\item[hStream] - Stream to query
\item[phGraph] - The captured graph
\end{itemize}
\end{description}

\begin{description}
\item[Returns]
\begin{itemize}
\item[CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_STREAM_CAPTURE_WRONG_THREAD]
\end{itemize}
\end{description}

\begin{description}
\item[Description]
End capture on \texttt{hStream}, returning the captured graph via \texttt{phGraph}. Capture must have been initiated on \texttt{hStream} via a call to \texttt{cuStreamBeginCapture}. If capture was invalidated, due to a violation of the rules of stream capture, then a NULL graph will be returned.

If the \texttt{mode} argument to \texttt{cuStreamBeginCapture} was not \texttt{CU_STREAM_CAPTURE_MODE_RELAXED}, this call must be from the same thread as \texttt{cuStreamBeginCapture}.

\begin{quote}
Note that this function may also return error codes from previous, asynchronous launches.
\end{quote}
See also:
cuStreamCreate, cuStreamBeginCapture, cuStreamIsCapturing

CUresult cuStreamGetCaptureInfo (CUstream hStream, CUStructCaptureStatus *captureStatus, cuuint64_t *id)
Query capture status of a stream.

Returns
CUDA_SUCCESS, CUDA_ERROR_STREAM_CAPTURE_IMPLICIT

Description
Query the capture status of a stream and get an id for the capture sequence, which is unique over the lifetime of the process.

If called on CU_STREAM_LEGACY (the "null stream") while a stream not created with CU_STREAM_NON_BLOCKING is capturing, returns CUDA_ERROR_STREAM_CAPTURE_IMPLICIT.

A valid id is returned only if both of the following are true:
- the call returns CUDA_SUCCESS
- captureStatus is set to CU_STREAM_CAPTURE_STATUS_ACTIVE

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamBeginCapture, cuStreamIsCapturing

CUresult cuStreamGetCtx (CUstream hStream, CUCtx *pctx)
Query the context associated with a stream.

Parameters

hStream
- Handle to the stream to be queried

pctx
- Returned context associated with the stream
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE,

Description

Returns the CUDA context that the stream is associated with.

The stream handle `hStream` can refer to any of the following:

- a stream created via any of the CUDA driver APIs such as `cuStreamCreate` and `cuStreamCreateWithPriority`, or their runtime API equivalents such as `cudaStreamCreate`, `cudaStreamCreateWithFlags` and `cudaStreamCreateWithPriority`. The returned context is the context that was active in the calling thread when the stream was created. Passing an invalid handle will result in undefined behavior.

- any of the special streams such as the NULL stream, `CU_STREAM_LEGACY` and `CU_STREAM_PER_THREAD`. The runtime API equivalents of these are also accepted, which are NULL, `cudaStreamLegacy` and `cudaStreamPerThread` respectively. Specifying any of the special handles will return the context current to the calling thread. If no context is current to the calling thread, `CUDA_ERROR_INVALID_CONTEXT` is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuStreamGetFlags (CUstream hStream, unsigned int *flags)

Query the flags of a given stream.

Parameters

hStream

- Handle to the stream to be queried
flags
- Pointer to an unsigned integer in which the stream's flags are returned. The value returned in flags is a logical 'OR' of all flags that were used while creating this stream. See cuStreamCreate for the list of valid flags.

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_OUT_OF_MEMORY

Description
Query the flags of a stream created using cuStreamCreate or cuStreamCreateWithPriority and return the flags in flags.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamDestroy, cuStreamCreate, cuStreamGetPriority, cudaStreamGetFlags

CUresult cuStreamGetPriority (CUstream hStream, int *priority)
Query the priority of a given stream.

Parameters
hStream
- Handle to the stream to be queried
priority
- Pointer to a signed integer in which the stream's priority is returned

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_OUT_OF_MEMORY
**Description**

Query the priority of a stream created using `cuStreamCreate` or `cuStreamCreateWithPriority` and return the priority in `priority`. Note that if the stream was created with a priority outside the numerical range returned by `cuCtxGetStreamPriorityRange`, this function returns the clamped priority. See `cuStreamCreateWithPriority` for details about priority clamping.

Note that this function may also return error codes from previous, asynchronous launches.

**See also:**

`cuStreamDestroy`, `cuStreamCreate`, `cuStreamCreateWithPriority`, `cuCtxGetStreamPriorityRange`, `cuStreamGetFlags`, `cudaStreamGetPriority`

**CUresult cuStreamIsCapturing (CUstream hStream, CUstreamCaptureStatus *captureStatus)**

Returns a stream’s capture status.

**Parameters**

- **hStream**
  - Stream to query

- **captureStatus**
  - Returns the stream’s capture status

**Returns**

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_VALUE`, `CUDA_ERROR_STREAM_CAPTURE_IMPLICIT`

**Description**

Return the capture status of `hStream` via `captureStatus`. After a successful call, `captureStatus` will contain one of the following:

- `CU_STREAM_CAPTURE_STATUS_NONE`: The stream is not capturing.
- `CU_STREAM_CAPTURE_STATUS_ACTIVE`: The stream is capturing.
- `CU_STREAM_CAPTURE_STATUS_INVALIDATED`: The stream was capturing but an error has invalidated the capture sequence. The capture sequence must be terminated with `cuStreamEndCapture` on the stream where it was initiated in order to continue using `hStream`. 
Note that, if this is called on `CU_STREAM_LEGACY` (the "null stream") while a blocking stream in the same context is capturing, it will return `CUDA_ERROR_STREAM_CAPTURE_IMPLICIT` and `*captureStatus` is unspecified after the call. The blocking stream capture is not invalidated.

When a blocking stream is capturing, the legacy stream is in an unusable state until the blocking stream capture is terminated. The legacy stream is not supported for stream capture, but attempted use would have an implicit dependency on the capturing stream(s).

- **Note that this function may also return error codes from previous, asynchronous launches.**

See also:
- `cuStreamCreate`, `cuStreamBeginCapture`, `cuStreamEndCapture`

### CUresult cuStreamQuery (CUstream hStream)
Determine status of a compute stream.

#### Parameters
- **hStream**
  - Stream to query status of

#### Returns
- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_HANDLE`, `CUDA_ERROR_NOT_READY`

#### Description
Returns `CUDA_SUCCESS` if all operations in the stream specified by `hStream` have completed, or `CUDA_ERROR_NOT_READY` if not.

For the purposes of Unified Memory, a return value of `CUDA_SUCCESS` is equivalent to having called `cuStreamSynchronize()`.

- **This function uses standard default stream semantics.**
- **Note that this function may also return error codes from previous, asynchronous launches.**
See also:
cuStreamCreate, cuStreamWaitEvent, cuStreamDestroy, cuStreamSynchronize, cuStreamAddCallback, cudaStreamQuery

CUresult cuStreamSynchronize (CUstream hStream)
Wait until a stream's tasks are completed.

Parameters
hStream
- Stream to wait for

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE

Description
Waits until the device has completed all operations in the stream specified by hStream. If the context was created with the CU_CTX_SCHED_BLOCKING_SYNC flag, the CPU thread will block until the stream is finished with all of its tasks.

- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamCreate, cuStreamDestroy, cuStreamWaitEvent, cuStreamQuery, cuStreamAddCallback, cudaStreamSynchronize

CUresult cuStreamWaitEvent (CUstream hStream, CUevent hEvent, unsigned int Flags)
Make a compute stream wait on an event.

Parameters
hStream
- Stream to wait
hEvent
- Event to wait on (may not be NULL)
Flags
- Parameters for the operation (must be 0)

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE,

Description
Makes all future work submitted to hStream wait for all work captured in hEvent. See cuEventRecord() for details on what is captured by an event. The synchronization will be performed efficiently on the device when applicable. hEvent may be from a different context or device than hStream.

‣ This function uses standard default stream semantics.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamCreate, cuEventRecord, cuStreamQuery, cuStreamSynchronize,
cuStreamAddCallback, cuStreamDestroy, cudaStreamWaitEvent

CUresult cuThreadExchangeStreamCaptureMode (CUstreamCaptureMode *mode)
Swaps the stream capture interaction mode for a thread.

Parameters
mode
- Pointer to mode value to swap with the current mode

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Sets the calling thread’s stream capture interaction mode to the value contained in *mode, and overwrites *mode with the previous mode for the thread. To facilitate
deterministic behavior across function or module boundaries, callers are encouraged to use this API in a push-pop fashion:

```
CUstreamCaptureMode mode = desiredMode;
cuThreadExchangeStreamCaptureMode(&mode);
...
cuThreadExchangeStreamCaptureMode(&mode); // restore previous mode
```

During stream capture (see `cuStreamBeginCapture`), some actions, such as a call to `cudaMalloc`, may be unsafe. In the case of `cudaMalloc`, the operation is not enqueued asynchronously to a stream, and is not observed by stream capture. Therefore, if the sequence of operations captured via `cuStreamBeginCapture` depended on the allocation being replayed whenever the graph is launched, the captured graph would be invalid.

Therefore, stream capture places restrictions on API calls that can be made within or concurrently to a `cuStreamBeginCapture-cuStreamEndCapture` sequence. This behavior can be controlled via this API and flags to `cuStreamBeginCapture`.

A thread’s mode is one of the following:

- **CU_STREAM_CAPTURE_MODE_GLOBAL**: This is the default mode. If the local thread has an ongoing capture sequence that was not initiated with `CU_STREAM_CAPTURE_MODE_RELAXED` at `cuStreamBeginCapture`, or if any other thread has a concurrent capture sequence initiated with `CU_STREAM_CAPTURE_MODE_GLOBAL`, this thread is prohibited from potentially unsafe API calls.

- **CU_STREAM_CAPTURE_MODE_THREAD_LOCAL**: If the local thread has an ongoing capture sequence not initiated with `CU_STREAM_CAPTURE_MODE_RELAXED`, it is prohibited from potentially unsafe API calls. Concurrent capture sequences in other threads are ignored.

- **CU_STREAM_CAPTURE_MODE_RELAXED**: The local thread is not prohibited from potentially unsafe API calls. Note that the thread is still prohibited from API calls which necessarily conflict with stream capture, for example, attempting `cuEventQuery` on an event that was last recorded inside a capture sequence.

Note that this function may also return error codes from previous, asynchronous launches.

`cuStreamBeginCapture`
5.14. Event Management

This section describes the event management functions of the low-level CUDA driver application programming interface.

CUresult cuEventCreate (CUevent *phEvent, unsigned int Flags)

Creates an event.

Parameters

phEvent
- Returns newly created event

Flags
- Event creation flags

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

Description

Creates an event *phEvent for the current context with the flags specified via Flags. Valid flags include:

▶ **CU_EVENT_DEFAULT**: Default event creation flag.

▶ **CU_EVENT_BLOCKING_SYNC**: Specifies that the created event should use blocking synchronization. A CPU thread that uses cuEventSynchronize() to wait on an event created with this flag will block until the event has actually been recorded.

▶ **CU_EVENT_DISABLE_TIMING**: Specifies that the created event does not need to record timing data. Events created with this flag specified and the **CU_EVENT_BLOCKING_SYNC** flag not specified will provide the best performance when used with cuStreamWaitEvent() and cuEventQuery().

▶ **CU_EVENT_INTERPROCESS**: Specifies that the created event may be used as an interprocess event by cuIpcGetEventHandle(). **CU_EVENT_INTERPROCESS** must be specified along with **CU_EVENT_DISABLE_TIMING**.

Note that this function may also return error codes from previous, asynchronous launches.
See also:
cuEventRecord, cuEventQuery, cuEventSynchronize, cuEventDestroy, cuEventElapsedTime, cudaEventCreate, cudaEventCreateWithFlags

CUresult cuEventDestroy (CUevent hEvent)
Destroys an event.

Parameters
hEvent
- Event to destroy

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE

Description
Destroys the event specified by hEvent.
An event may be destroyed before it is complete (i.e., while cuEventQuery() would return CUDA_ERROR_NOT_READY). In this case, the call does not block on completion of the event, and any associated resources will automatically be released asynchronously at completion.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuEventCreate, cuEventRecord, cuEventQuery, cuEventSynchronize, cuEventElapsedTime, cudaEventDestroy

CUresult cuEventElapsedTime (float *pMilliseconds, CUevent hStart, CUevent hEnd)
Computes the elapsed time between two events.

Parameters
pMilliseconds
- Time between hStart and hEnd in ms
hStart
- Starting event
hEnd
- Ending event

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_READY

Description
Computes the elapsed time between two events (in milliseconds with a resolution of around 0.5 microseconds).

If either event was last recorded in a non-NULL stream, the resulting time may be greater than expected (even if both used the same stream handle). This happens because the cuEventRecord() operation takes place asynchronously and there is no guarantee that the measured latency is actually just between the two events. Any number of other different stream operations could execute in between the two measured events, thus altering the timing in a significant way.

If cuEventRecord() has not been called on either event then CUDA_ERROR_INVALID_HANDLE is returned. If cuEventRecord() has been called on both events but one or both of them has not yet been completed (that is, cuEventQuery() would return CUDA_ERROR_NOT_READY on at least one of the events), CUDA_ERROR_NOT_READY is returned. If either event was created with the CU_EVENT_DISABLE_TIMING flag, then this function will return CUDA_ERROR_INVALID_HANDLE.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuEventCreate, cuEventRecord, cuEventQuery, cuEventSynchronize, cuEventDestroy, cudaEventElapsedTime
CUresult cuEventQuery (CUevent hEvent)
Queries an event’s status.

Parameters

hEvent
- Event to query

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_READY

Description
Queries the status of all work currently captured by hEvent. See cuEventRecord() for
details on what is captured by an event.

Returns CUDA_SUCCESS if all captured work has been completed, or
CUDA_ERROR_NOT_READY if any captured work is incomplete.

For the purposes of Unified Memory, a return value of CUDA_SUCCESS is equivalent to
having called cuEventSynchronize().

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuEventCreate, cuEventRecord, cuEventSynchronize, cuEventDestroy,
cuEventElapsedTime, cudaEventQuery

CUresult cuEventRecord (CUevent hEvent, CUstream hStream)
Records an event.

Parameters

hEvent
- Event to record
hStream
- Stream to record event for
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE

Description

Captures in hEvent the contents of hStream at the time of this call. hEvent and
hStream must be from the same context. Calls such as cuEventQuery() or
cuStreamWaitEvent() will then examine or wait for completion of the work that was
captured. Uses of hStream after this call do not modify hEvent. See note on default
stream behavior for what is captured in the default case.

cuEventRecord() can be called multiple times on the same event and will overwrite
the previously captured state. Other APIs such as cuStreamWaitEvent() use the most
recently captured state at the time of the API call, and are not affected by later calls to
cuEventRecord(). Before the first call to cuEventRecord(), an event represents an empty
set of work, so for example cuEventQuery() would return CUDA_SUCCESS.

‣ This function uses standard default stream semantics.
‣ Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuEventCreate, cuEventQuery, cuEventSynchronize, cuStreamWaitEvent,
cuEventDestroy, cuEventElapsedTime, cudaEventRecord

CUresult cuEventSynchronize (CUevent hEvent)

Waits for an event to complete.

Parameters

hEvent
  - Event to wait for

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE
Description

Waits until the completion of all work currently captured in hEvent. See cuEventRecord() for details on what is captured by an event.

Waiting for an event that was created with the CU_EVENT_BLOCKING_SYNC flag will cause the calling CPU thread to block until the event has been completed by the device. If the CU_EVENT_BLOCKING_SYNC flag has not been set, then the CPU thread will busy-wait until the event has been completed by the device.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuEventCreate, cuEventRecord, cuEventQuery, cuEventDestroy, cuEventElapsedTime, cudaEventSynchronize

5.15. External Resource Interoperability

This section describes the external resource interoperability functions of the low-level CUDA driver application programming interface.

CUresult cuDestroyExternalMemory (CUexternalMemory extMem)

Destroys an external memory object.

Parameters

extMem
- External memory object to be destroyed

Returns

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_HANDLE

Description

Destroys the specified external memory object. Any existing buffers and CUDA mipmapped arrays mapped onto this object must no longer be used and must be explicitly freed using cuMemFree and cuMipmappedArrayDestroy respectively.
CUresult cuDestroyExternalSemaphore (CUexternalSemaphore extSem)

Destroys an external semaphore.

Parameters

extSem
- External semaphore to be destroyed

Returns

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_HANDLE

Description

Destroys an external semaphore object and releases any references to the underlying resource. Any outstanding signals or waits must have completed before the semaphore is destroyed.
 CUresult cuExternalMemoryGetMappedBuffer(CUdeviceptr *devPtr, CUexternalMemory extMem, const CUDA_EXTERNAL_MEMORY_BUFFER_DESC *bufferDesc)
Maps a buffer onto an imported memory object.

Parameters

`devPtr`
- Returned device pointer to buffer

`extMem`
- Handle to external memory object

`bufferDesc`
- Buffer descriptor

Returns

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED,
CUDA_ERROR_INVALID_HANDLE

Description

Maps a buffer onto an imported memory object and returns a device pointer in `devPtr`.

The properties of the buffer being mapped must be described in `bufferDesc`. The `CUDA_EXTERNAL_MEMORY_BUFFER_DESC` structure is defined as follows:

```c
typedef struct CUDA_EXTERNAL_MEMORY_BUFFER_DESC_st {
    unsigned long long offset;
    unsigned long long size;
    unsigned int flags;
} CUDA_EXTERNAL_MEMORY_BUFFER_DESC;
```

where `CUDA_EXTERNAL_MEMORY_BUFFER_DESC::offset` is the offset in the memory object where the buffer's base address is. `CUDA_EXTERNAL_MEMORY_BUFFER_DESC::size` is the size of the buffer. `CUDA_EXTERNAL_MEMORY_BUFFER_DESC::flags` must be zero.

The offset and size have to be suitably aligned to match the requirements of the external API. Mapping two buffers whose ranges overlap may or may not result in the same virtual address being returned for the overlapped portion. In such cases, the application must ensure that all accesses to that region from the GPU are volatile. Otherwise writes made via one address are not guaranteed to be visible via the other address, even if they're issued by the same thread. It is recommended that applications map the combined range instead of mapping separate buffers and then apply the appropriate offsets to the returned pointer to derive the individual buffers.

The returned pointer `devPtr` must be freed using `cuMemFree`. 
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuImportExternalMemory cuDestroyExternalMemory,
cuExternalMemoryGetMappedMipmappedArray

CUresult cuExternalMemoryGetMappedMipmappedArray
(CUmipmappedArray *mipmap,
CUexternalMemory extMem, const
CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC
*mipmapDesc)
Maps a CUDA mipmapped array onto an external memory object.

Parameters

mipmap
- Returned CUDA mipmapped array

extMem
- Handle to external memory object

mipmapDesc
- CUDA array descriptor

Returns

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED,
CUDA_ERROR_INVALID_HANDLE

Description

Maps a CUDA mipmapped array onto an external object and returns a handle to it in
mipmap.

The properties of the CUDA mipmapped array being
mapped must be described in mipmapDesc. The structure
CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC is defined as follows:

```c
typedef struct CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC_st {
    unsigned long long offset;
    CUDA_ARRAY3D_DESCRIPTOR arrayDesc;
    unsigned int numLevels;
} CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC;
```
where `CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::offset` is the offset in the memory object where the base level of the mipmap chain is. `CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::arrayDesc` describes the format, dimensions and type of the base level of the mipmap chain. For further details on these parameters, please refer to the documentation for `cuMipmappedArrayCreate`. Note that if the mipmapped array is bound as a color target in the graphics API, then the flag `CUDA_ARRAY3D_COLOR_ATTACHMENT` must be specified in `CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::arrayDesc::Flags`. `CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::numLevels` specifies the total number of levels in the mipmap chain.

The returned CUDA mipmapped array must be freed using `cuMipmappedArrayDestroy`.

See also:
- `cuImportExternalMemory`, `cuDestroyExternalMemory`, `cuExternalMemoryGetMappedBuffer`

```c
CUresult cuImportExternalMemory
(CUexternalMemory *extMem_out, const
CUDA_EXTERNAL_MEMORY_HANDLE_DESC
*memHandleDesc)
```
Imports an external memory object.

**Parameters**
- `extMem_out` - Returned handle to an external memory object
- `memHandleDesc` - Memory import handle descriptor

**Returns**
- `CUDA_SUCCESS`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_HANDLE`
Description

Imports an externally allocated memory object and returns a handle to that in extMem_out.

The properties of the handle being imported must be described in memHandleDesc. The CUDA_EXTERNAL_MEMORY_HANDLE_DESC structure is defined as follows:

```c
typedef struct CUDA_EXTERNAL_MEMORY_HANDLE_DESC_st {
    CUexternalMemoryHandleType type;
    union {
        int fd;
        struct {
            void *handle;
            const void *name;
        } win32;
    } handle;
    unsigned long long size;
    unsigned int flags;
} CUDA_EXTERNAL_MEMORY_HANDLE_DESC;
```

where CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type specifies the type of handle being imported. CUexternalMemoryHandleType is defined as:

```c
typedef enum CUexternalMemoryHandleType_enum {
    CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD        = 1,
    CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32     = 2,
    CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT = 3,
    CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP       = 4,
    CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE   = 5
} CUexternalMemoryHandleType;
```

If CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type is CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD, then CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::fd must be a valid file descriptor referencing a memory object. Ownership of the file descriptor is transferred to the CUDA driver when the handle is imported successfully. Performing any operations on the file descriptor after it is imported results in undefined behavior.

If CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type is CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32, then exactly one of CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle and CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name must not be NULL. If CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle is not NULL, then it must represent a valid shared NT handle that references a memory object. Ownership of this handle is not transferred to CUDA after the import operation, so the application must release the handle using the appropriate system call. If CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name is not NULL, then it must point to a NULL-terminated array of UTF-16 characters that refers to a memory object.

If CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type is CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT, then CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle must be non-NULL and CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name must
be NULL. The handle specified must be a globally shared KMT handle. This handle does not hold a reference to the underlying object, and thus will be invalid when all references to the memory object are destroyed.

If `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type` is `CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP`, then exactly one of `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle` and `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name` must not be NULL. If `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle` is not NULL, then it must represent a valid shared NT handle that is returned by `ID3DDevice::CreateSharedHandle` when referring to a ID3D12Heap object. This handle holds a reference to the underlying object. If `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name` is not NULL, then it must point to a NULL-terminated array of UTF-16 characters that refers to a ID3D12Heap object.

If `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type` is `CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE`, then exactly one of `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle` and `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name` must not be NULL. If `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::handle` is not NULL, then it must represent a valid shared NT handle that is returned by `ID3DDevice::CreateSharedHandle` when referring to a ID3D12Resource object. This handle holds a reference to the underlying object. If `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle::win32::name` is not NULL, then it must point to a NULL-terminated array of UTF-16 characters that refers to a ID3D12Resource object.

The size of the memory object must be specified in `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::size`.

Specifying the flag `CUDA_EXTERNAL_MEMORY_DEDICATED` in `CUDA_EXTERNAL_MEMORY_HANDLE_DESC::flags` indicates that the resource is a dedicated resource. The definition of what a dedicated resource is outside the scope of this extension.

Note that this function may also return error codes from previous, asynchronous launches.

If the Vulkan memory imported into CUDA is mapped on the CPU then the application must use `vkInvalidateMappedMemoryRanges`/`vkFlushMappedMemoryRanges` as well as appropriate Vulkan pipeline barriers to maintain coherence between CPU and GPU. For more information on these APIs, please refer to "Synchronization and Cache Control" chapter from Vulkan specification.
See also:
cuDestroyExternalMemory, cuExternalMemoryGetMappedBuffer, 
cuExternalMemoryGetMappedMipmappedArray

CUresult cuImportExternalSemaphore
(CUexternalSemaphore *extSem_out, const
CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC
*semHandleDesc)
Imports an external semaphore.

Parameters
extSem_out
- Returned handle to an external semaphore
semHandleDesc
- Semaphore import handle descriptor

Returns
CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED,
CUDA_ERROR_INVALID_HANDLE

Description
Imports an externally allocated synchronization object and returns a handle to that in
extSem_out.

The properties of the handle being imported must be described in semHandleDesc. The
CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC is defined as follows:

```c
typedef struct CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC_st {
    CUexternalSemaphoreHandleType type;
    union {
        int fd;
        struct {
            void *handle;
            const void *name;
        } win32;
    } handle;
    unsigned int flags;
} CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC;
```

where CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::type specifies the type of
handle being imported. CUexternalSemaphoreHandleType is defined as:

```c
typedef enum CUexternalSemaphoreHandleType_enum {
    CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD        = 1,
    CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32     = 2,
    CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT = 3,
    CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE      = 4
} CUexternalSemaphoreHandleType;
```
If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::type` is `CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD`, then `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.fd` must be a valid file descriptor referencing a synchronization object. Ownership of the file descriptor is transferred to the CUDA driver when the handle is imported successfully. Performing any operations on the file descriptor after it is imported results in undefined behavior.

If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::type` is `CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32`, then exactly one of `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.handle` and `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.name` must not be NULL. If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.handle` is not NULL, then it must represent a valid shared NT handle that references a synchronization object. Ownership of this handle is not transferred to CUDA after the import operation, so the application must release the handle using the appropriate system call. If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.name` is not NULL, then it must name a valid synchronization object.

If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::type` is `CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT`, then `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.handle` must be non-NULL and `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.name` must be NULL. The handle specified must be a globally shared KMT handle. This handle does not hold a reference to the underlying object, and thus will be invalid when all references to the synchronization object are destroyed.

If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::type` is `CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE`, then exactly one of `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.handle` and `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.name` must not be NULL. If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.handle` is not NULL, then it must represent a valid shared NT handle that is returned by `ID3DDevice::CreateSharedHandle` when referring to a `ID3D12Fence` object. This handle holds a reference to the underlying object. If `CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle.win32.name` is not NULL, then it must name a valid synchronization object that refers to a valid `ID3D12Fence` object.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuDestroyExternalSemaphore, cuSignalExternalSemaphoresAsync, cuWaitExternalSemaphoresAsync

**CUresult cuSignalExternalSemaphoresAsync**
(const CUexternalSemaphore *extSemArray, const CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS *paramsArray, unsigned int numExtSems, CUstream stream)

Signals a set of external semaphore objects.

**Parameters**

- **extSemArray**
  - Set of external semaphores to be signaled
- **paramsArray**
  - Array of semaphore parameters
- **numExtSems**
  - Number of semaphores to signal
- **stream**
  - Stream to enqueue the signal operations in

**Returns**

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_HANDLE

**Description**

Enqueues a signal operation on a set of externally allocated semaphore object in the specified stream. The operations will be executed when all prior operations in the stream complete.

The exact semantics of signaling a semaphore depends on the type of the object.

If the semaphore object is any one of the following types:

- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD,
- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32,
- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT then signaling the semaphore will set it to the signaled state.

If the semaphore object is of the type

- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE,
then the semaphore will be set to the value specified in CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS::params::fence::value.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuImportExternalSemaphore, cuDestroyExternalSemaphore,
cuWaitExternalSemaphoresAsync

CUresult cuWaitExternalSemaphoresAsync (const
CUexternalSemaphore *extSemArray, const
CUDA_EXTERNAL_SEMAPHORE_WAIT_PARAMS
*paramsArray, unsigned int numExtSems, CUstream
stream)
Waits on a set of external semaphore objects.

Parameters

extSemArray
  - External semaphores to be waited on
paramsArray
  - Array of semaphore parameters
numExtSems
  - Number of semaphores to wait on
stream
  - Stream to enqueue the wait operations in

Returns

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED,
CUDA_ERROR_INVALID_HANDLE

Description

Enqueues a wait operation on a set of externally allocated semaphore object in the
specified stream. The operations will be executed when all prior operations in the stream
complete.

The exact semantics of waiting on a semaphore depends on the type of the object.

If the semaphore object is any one of the following types:
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD,
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32,
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT then
waiting on the semaphore will wait until the semaphore reaches the signaled state. The semaphore will then be reset to the unsignaled state. Therefore for every signal operation, there can only be one wait operation.

If the semaphore object is of the type `CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE`, then waiting on the semaphore will wait until the value of the semaphore is greater than or equal to `CUDA_EXTERNAL_SEMAPHORE_WAIT_PARAMS::params::fence::value`.

Note that this function may also return error codes from previous, asynchronous launches.

- `cuDestroyExternalSemaphore`
- `cuSignalExternalSemaphoresAsync`

### 5.16. Stream memory operations

This section describes the stream memory operations of the low-level CUDA driver application programming interface.

The whole set of operations is disabled by default. Users are required to explicitly enable them, e.g. on Linux by passing the kernel module parameter shown below: `modprobe nvidia NVreg_EnableStreamMemOPs=1`. There is currently no way to enable these operations on other operating systems.

Users can programmatically query whether the device supports these operations with `cuDeviceGetAttribute()` and `CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_MEM_OPS`.

Support for the `CU_STREAM_WAIT_VALUE_NOR` flag can be queried with `CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_WAIT_VALUE_NOR`.

Support for the `cuStreamWriteValue64()` and `cuStreamWaitValue64()` functions, as well as for the `CU_STREAM_MEM_OP_WAIT_VALUE_64` and `CU_STREAM_MEM_OP_WRITE_VALUE_64` flags, can be queried with `CU_DEVICE_ATTRIBUTE_CAN_USE_64_BIT_STREAM_MEM_OPS`.

Support for both `CU_STREAM_WAIT_VALUE_FLUSH` and `CU_STREAM_MEM_OP_FLUSH_REMOTE_WRITES` requires dedicated platform hardware features and can be queried with `cuDeviceGetAttribute()` and `CU_DEVICE_ATTRIBUTE_CAN_FLUSH_REMOTE_WRITES`. 
Note that all memory pointers passed as parameters to these operations are device pointers. Where necessary a device pointer should be obtained, for example with cuMemHostGetDevicePointer().

None of the operations accepts pointers to managed memory buffers (cuMemAllocManaged).

**CUresult cuStreamBatchMemOp (CUstream stream, unsigned int count, CUstreamBatchMemOpParams *paramArray, unsigned int flags)**

Batch operations to synchronize the stream via memory operations.

**Parameters**

- **stream**
  The stream to enqueue the operations in.

- **count**
  The number of operations in the array. Must be less than 256.

- **paramArray**
  The types and parameters of the individual operations.

- **flags**
  Reserved for future expansion; must be 0.

**Returns**

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_SUPPORTED

**Description**

This is a batch version of cuStreamWaitValue32() and cuStreamWriteValue32(). Batching operations may avoid some performance overhead in both the API call and the device execution versus adding them to the stream in separate API calls. The operations are enqueued in the order they appear in the array.

See CUstreamBatchMemOpType for the full set of supported operations, and cuStreamWaitValue32(), cuStreamWaitValue64(), cuStreamWriteValue32(), and cuStreamWriteValue64() for details of specific operations.

Basic support for this can be queried with cuDeviceGetAttribute() and CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_MEM_OPS. See related APIs for details on querying support for specific operations.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamWaitValue32, cuStreamWaitValue64, cuStreamWriteValue32, cuStreamWriteValue64, cuMemHostRegister

CUresult cuStreamWaitValue32 (CUstream stream, CUdeviceptr addr, cuuint32_t value, unsigned int flags)
Wait on a memory location.

Parameters
stream
The stream to synchronize on the memory location.
addr
The memory location to wait on.
value
The value to compare with the memory location.
flags
See CUstreamWaitValue_flags.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_SUPPORTED

Description
Enqueues a synchronization of the stream on the given memory location. Work ordered after the operation will block until the given condition on the memory is satisfied. By default, the condition is to wait for (int32_t)(*addr - value) >= 0, a cyclic greater-or-equal. Other condition types can be specified via flags.

If the memory was registered via cuMemHostRegister(), the device pointer should be obtained with cuMemHostGetDevicePointer(). This function cannot be used with managed memory (cuMemAllocManaged).

Support for this can be queried with cuDeviceGetAttribute() and
CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_MEM_OPS.

Support for CU_STREAM_WAIT_VALUE_NOR
can be queried with cuDeviceGetAttribute() and
CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_WAIT_VALUE_NOR.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuStreamWaitValue64, cuStreamWriteValue32, cuStreamWriteValue64

cuStreamBatchMemOp, cuMemHostRegister, cuStreamWaitEvent

CUresult cuStreamWaitValue64 (CUstream stream, CUdeviceptr addr, cuuint64_t value, unsigned int flags)

Wait on a memory location.

Parameters

stream
    The stream to synchronize on the memory location.
addr
    The memory location to wait on.
value
    The value to compare with the memory location.
flags
    See CUstreamWaitValue_flags.

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_NOT_SUPPORTED

Description

Enqueues a synchronization of the stream on the given memory location. Work ordered after the operation will block until the given condition on the memory is satisfied. By default, the condition is to wait for (int64_t)(*addr - value) >= 0, a cyclic greater-or-equal. Other condition types can be specified via flags.

If the memory was registered via cuMemHostRegister(), the device pointer should be obtained with cuMemHostGetDevicePointer().

Support for this can be queried with cuDeviceGetAttribute() and
CU_DEVICE_ATTRIBUTE_CAN_USE_64_BIT_STREAM_MEM_OPS.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamWaitValue32, cuStreamWriteValue32, cuStreamWriteValue64, cuStreamBatchMemOp, cuMemHostRegister, cuStreamWaitEvent

CUresult cuStreamWriteValue32 (CUstream stream, CUdeviceptr addr, cuuint32_t value, unsigned int flags)
Write a value to memory.

Parameters
stream
The stream to do the write in.
addr
The device address to write to.
value
The value to write.
flags
See CUstreamWriteValue_flags.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_SUPPORTED

Description
Write a value to memory. Unless the CU_STREAM_WRITE_VALUE_NO_MEMORY_BARRIER flag is passed, the write is preceded by a system-wide memory fence, equivalent to a __threadfence_system() but scoped to the stream rather than a CUDA thread.

If the memory was registered via cuMemHostRegister(), the device pointer should be obtained with cuMemHostGetDevicePointer(). This function cannot be used with managed memory (cuMemAllocManaged).

Support for this can be queried with cuDeviceGetAttribute() and CU_DEVICE_ATTRIBUTE_CAN_USE_STREAM_MEM_OPS.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuStreamWriteValue64, cuStreamWaitValue32, cuStreamWaitValue64, cuStreamBatchMemOp, cuMemHostRegister, cuEventRecord

CUresult cuStreamWriteValue64 (CUstream stream, CUdeviceptr addr, cuuint64_t value, unsigned int flags)
Write a value to memory.

Parameters
stream
The stream to do the write in.
addr
The device address to write to.
value
The value to write.
flags
See CUstreamWriteValue_flags.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_NOT_SUPPORTED

Description
Write a value to memory. Unless the
CU_STREAM_WRITE_VALUE_NO_MEMORY_BARRIER flag is passed, the write is
preceded by a system-wide memory fence, equivalent to a __threadfence_system() but
scoped to the stream rather than a CUDA thread.

If the memory was registered via cuMemHostRegister(), the device pointer should be
obtained with cuMemHostGetDevicePointer().

Support for this can be queried with cuDeviceGetAttribute() and
CU_DEVICE_ATTRIBUTE_CAN_USE_64_BIT_STREAM_MEM_OPS.

Note that this function may also return error codes from previous, asynchronous launches.
See also:
cuStreamWriteValue32, cuStreamWaitValue32, cuStreamWaitValue64, cuStreamBatchMemOp, cuMemHostRegister, cuEventRecord

5.17. Execution Control

This section describes the execution control functions of the low-level CUDA driver application programming interface.

CUresult cuFuncGetAttribute (int *pi, CUfunction_attribute attrib, CUfunction hfunc)
Returns information about a function.

Parameters
pi
- Returned attribute value
attrib
- Attribute requested
hfunc
- Function to query attribute of

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE

Description
Returns in *pi the integer value of the attribute attrib on the kernel given by hfunc.

The supported attributes are:

- **CU_FUNC_ATTRIBUTE_MAX_THREADS_PER_BLOCK**: The maximum number of threads per block, beyond which a launch of the function would fail. This number depends on both the function and the device on which the function is currently loaded.
- **CU_FUNC_ATTRIBUTE_SHARED_SIZE_BYTES**: The size in bytes of statically-allocated shared memory per block required by this function. This does not include dynamically-allocated shared memory requested by the user at runtime.
- **CU_FUNC_ATTRIBUTE_CONST_SIZE_BYTES**: The size in bytes of user-allocated constant memory required by this function.
CU_FUNC_ATTRIBUTE_LOCAL_SIZE_BYTES: The size in bytes of local memory used by each thread of this function.

CU_FUNC_ATTRIBUTE_NUM_REGS: The number of registers used by each thread of this function.

CU_FUNC_ATTRIBUTE_PTX_VERSION: The PTX virtual architecture version for which the function was compiled. This value is the major PTX version * 10 + the minor PTX version, so a PTX version 1.3 function would return the value 13. Note that this may return the undefined value of 0 for cubins compiled prior to CUDA 3.0.

CU_FUNC_ATTRIBUTE_BINARY_VERSION: The binary architecture version for which the function was compiled. This value is the major binary version * 10 + the minor binary version, so a binary version 1.3 function would return the value 13. Note that this will return a value of 10 for legacy cubins that do not have a properly-encoded binary architecture version.

CU_FUNC_CACHE_MODE_CA: The attribute to indicate whether the function has been compiled with user specified option "-Xptxas --dlcm=ca" set.

CU_FUNC_ATTRIBUTE_MAX_DYNAMIC_SHARED_SIZE_BYTES: The maximum size in bytes of dynamically-allocated shared memory.

CU_FUNC_ATTRIBUTE_PREFERRED_SHARED_MEMORY_CARVEOUT: Preferred shared memory-L1 cache split ratio in percent of total shared memory.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxGetCacheConfig, cuCtxSetCacheConfig, cuFuncSetCacheConfig, cuLaunchKernel, cudaFuncGetAttributes cudaFuncSetAttribute

CUresult cuFuncSetAttribute (CUfunction hfunc, CUfunction_attribute attrib, int value)

Sets information about a function.

Parameters

hfunc
  - Function to query attribute of
attrib
  - Attribute requested
value
  - The value to set
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE

Description

This call sets the value of a specified attribute `attrib` on the kernel given by `hfunc` to an integer value specified by `val`. This function returns CUDA_SUCCESS if the new value of the attribute could be successfully set. If the set fails, this call will return an error. Not all attributes can have values set. Attempting to set a value on a read-only attribute will result in an error (CUDA_ERROR_INVALID_VALUE).

Supported attributes for the cuFuncSetAttribute call are:

- **CU_FUNC_ATTRIBUTE_MAX_DYNAMIC_SHARED_SIZE_BYTES**: This maximum size in bytes of dynamically-allocated shared memory. The value should contain the requested maximum size of dynamically-allocated shared memory. The sum of this value and the function attribute `CU_FUNC_ATTRIBUTE_SHARED_SIZE_BYTES` cannot exceed the device attribute `CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_BLOCK_OPTIN`. The maximal size of requestable dynamic shared memory may differ by GPU architecture.

- **CU_FUNC_ATTRIBUTE_PREFERRED_SHARED_MEMORY_CARVEOUT**: On devices where the L1 cache and shared memory use the same hardware resources, this sets the shared memory carveout preference, in percent of the total shared memory. See `CU_DEVICE_ATTRIBUTE_MAX_SHARED_MEMORY_PER_MULTIPROCESSOR`. This is only a hint, and the driver can choose a different ratio if required to execute the function.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxGetCacheConfig, cuCtxSetCacheConfig, cuFuncSetCacheConfig, cuLaunchKernel, cudaFuncGetAttributes cudaFuncSetAttribute
CUresult cuFuncSetCacheConfig (CUfunction hfunc, CUfunc_cache config)

Sets the preferred cache configuration for a device function.

Parameters

hfunc
- Kernel to configure cache for

config
- Requested cache configuration

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED,
CUDA_ERROR_INVALID_CONTEXT

Description

On devices where the L1 cache and shared memory use the same hardware resources, this sets through config the preferred cache configuration for the device function hfunc. This is only a preference. The driver will use the requested configuration if possible, but it is free to choose a different configuration if required to execute hfunc. Any context-wide preference set via cuCtxSetCacheConfig() will be overridden by this per-function setting unless the per-function setting is CU_FUNC_CACHE_PREFER_NONE. In that case, the current context-wide setting will be used.

This setting does nothing on devices where the size of the L1 cache and shared memory are fixed.

Launching a kernel with a different preference than the most recent preference setting may insert a device-side synchronization point.

The supported cache configurations are:

- **CU_FUNC_CACHE_PREFER_NONE**: no preference for shared memory or L1 (default)
- **CU_FUNC_CACHE_PREFER_SHARED**: prefer larger shared memory and smaller L1 cache
- **CU_FUNC_CACHE_PREFER_L1**: prefer larger L1 cache and smaller shared memory
- **CU_FUNC_CACHE_PREFER_EQUAL**: prefer equal sized L1 cache and shared memory
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxGetCacheConfig, cuCtxSetCacheConfig, cuFuncGetAttribute, cuLaunchKernel, cudaFuncGetCacheConfig

CUresult cuFuncSetSharedMemConfig (CUfunction hfunc, CUsharedconfig config)
Sets the shared memory configuration for a device function.

Parameters

  hfunc  
  - kernel to be given a shared memory config

  config  
  - requested shared memory configuration

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT

Description

On devices with configurable shared memory banks, this function will force all subsequent launches of the specified device function to have the given shared memory bank size configuration. On any given launch of the function, the shared memory configuration of the device will be temporarily changed if needed to suit the function's preferred configuration. Changes in shared memory configuration between subsequent launches of functions, may introduce a device side synchronization point.

Any per-function setting of shared memory bank size set via cuFuncSetSharedMemConfig will override the context wide setting set with cuCtxSetSharedMemConfig.

Changing the shared memory bank size will not increase shared memory usage or affect occupancy of kernels, but may have major effects on performance. Larger bank sizes will allow for greater potential bandwidth to shared memory, but will change what kinds of accesses to shared memory will result in bank conflicts.

This function will do nothing on devices with fixed shared memory bank size.
The supported bank configurations are:

- **CU_SHARED_MEM_CONFIG_DEFAULT_BANK_SIZE**: use the context’s shared memory configuration when launching this function.
- **CU_SHARED_MEM_CONFIG_FOUR_BYTE_BANK_SIZE**: set shared memory bank width to be natively four bytes when launching this function.
- **CU_SHARED_MEM_CONFIG_EIGHT_BYTE_BANK_SIZE**: set shared memory bank width to be natively eight bytes when launching this function.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuCtxGetCacheConfig, cuCtxSetCacheConfig, cuCtxGetSharedMemConfig, cuCtxSetSharedMemConfig, cuFuncGetAttribute, cuLaunchKernel, cudaFuncSetSharedMemConfig

```c
CUresult cuLaunchCooperativeKernel (CUfunction f, unsigned int gridDimX, unsigned int gridDimY, unsigned int gridDimZ, unsigned int blockDimX, unsigned int blockDimY, unsigned int blockDimZ, unsigned int sharedMemBytes, CUstream hStream, void **kernelParams)
```

Launches a CUDA function where thread blocks can cooperate and synchronize as they execute.

**Parameters**

- **f**
  - Kernel to launch
- **gridDimX**
  - Width of grid in blocks
- **gridDimY**
  - Height of grid in blocks
- **gridDimZ**
  - Depth of grid in blocks
- **blockDimX**
  - X dimension of each thread block
- **blockDimY**
  - Y dimension of each thread block
- **sharedMemBytes**
  - Shared memory bytes
- **hStream**
  - CUDA stream
- **kernelParams**
  - Pointer to kernel parameters
blockDimZ
- Z dimension of each thread block

sharedMemBytes
- Dynamic shared-memory size per thread block in bytes

hStream
- Stream identifier

kernelParams
- Array of pointers to kernel parameters

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_IMAGE,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_LAUNCH_FAILED,
CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES,
CUDA_ERROR_LAUNCH_TIMEOUT,
CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING,
CUDA_ERROR_COOPERATIVE_LAUNCH_TOO_LARGE,
CUDA_ERROR_SHARED_OBJECT_INIT_FAILED

Description
Invokes the kernel \( f \) on a \( \text{gridDimX} \times \text{gridDimY} \times \text{gridDimZ} \) grid of blocks. Each block contains \( \text{blockDimX} \times \text{blockDimY} \times \text{blockDimZ} \) threads.

sharedMemBytes sets the amount of dynamic shared memory that will be available to each thread block.

The device on which this kernel is invoked must have a non-zero value for the device attribute \text{CU DEVICE ATTRIBUTE COOPERATIVE_LAUNCH}.

The total number of blocks launched cannot exceed the maximum number of blocks per multiprocessor as returned by \text{cuOccupancyMaxActiveBlocksPerMultiprocessor} (or \text{cuOccupancyMaxActiveBlocksPerMultiprocessorWithFlags}) times the number of multiprocessors as specified by the device attribute \text{CU DEVICE ATTRIBUTE MULTIPROCESSOR_COUNT}.

The kernel cannot make use of CUDA dynamic parallelism.

Kernel parameters must be specified via kernelParams. If \( f \) has \( N \) parameters, then kernelParams needs to be an array of \( N \) pointers. Each of kernelParams[0] through kernelParams[N-1] must point to a region of memory from which the actual kernel parameter will be copied. The number of kernel parameters and their offsets and sizes do not need to be specified as that information is retrieved directly from the kernel’s image.
Calling `cuLaunchCooperativeKernel()` sets persistent function state that is the same as function state set through `cuLaunchKernel` API.

When the kernel $f$ is launched via `cuLaunchCooperativeKernel()`, the previous block shape, shared size and parameter info associated with $f$ is overwritten.

Note that to use `cuLaunchCooperativeKernel()`, the kernel $f$ must either have been compiled with toolchain version 3.2 or later so that it will contain kernel parameter information, or have no kernel parameters. If either of these conditions is not met, then `cuLaunchCooperativeKernel()` will return `CUDA_ERROR_INVALID_IMAGE`.

- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

`cuCtxGetCacheConfig, cuCtxSetCacheConfig, cuFuncGetCacheConfig, cuFuncGetAttribute, cuLaunchCooperativeKernelMultiDevice, cudaLaunchCooperativeKernel`

`CUresult cuLaunchCooperativeKernelMultiDevice` *(CUDA_LAUNCH_PARAMS *launchParamsList, unsigned int numDevices, unsigned int flags)*

Launches CUDA functions on multiple devices where thread blocks can cooperate and synchronize as they execute.

**Parameters**

- `launchParamsList` - List of launch parameters, one per device
- `numDevices` - Size of the `launchParamsList` array
- `flags` - Flags to control launch behavior

**Returns**

`CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_IMAGE, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_LAUNCH_FAILED, CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES,`
CUDA_ERROR_LAUNCH_TIMEOUT,
CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING,
CUDA_ERROR_COOPERATIVE_LAUNCH_TOO_LARGE,
CUDA_ERROR_SHARED_OBJECT_INIT_FAILED

Description

Invokes kernels as specified in the launchParamsList array where each element of the array specifies all the parameters required to perform a single kernel launch. These kernels can cooperate and synchronize as they execute. The size of the array is specified by numDevices.

No two kernels can be launched on the same device. All the devices targeted by this multi-device launch must be identical.

All devices must have a non-zero value for the device attribute
\texttt{CU\_DEVICE\_ATTRIBUTE\_COORDERATIVE\_MULTI\_DEVICE\_LAUNCH}.

All kernels launched must be identical with respect to the compiled code. Note that any \texttt{__device__}, \texttt{__constant__} or \texttt{__managed__} variables present in the module that owns the kernel launched on each device, are independently instantiated on every device. It is the application's responsibility to ensure these variables are initialized and used appropriately.

The size of the grids as specified in blocks, the size of the blocks themselves and the amount of shared memory used by each thread block must also match across all launched kernels.

The streams used to launch these kernels must have been created via either \texttt{cuStreamCreate} or \texttt{cuStreamCreateWithPriority}. The NULL stream or \texttt{CU\_STREAM\_LEGACY} or \texttt{CU\_STREAM\_PER\_THREAD} cannot be used.

The total number of blocks launched per kernel cannot exceed the maximum number of blocks per multiprocessor as returned by \texttt{cuOccupancyMaxActiveBlocksPerMultiprocessor} (or \texttt{cuOccupancyMaxActiveBlocksPerMultiprocessorWithFlags}) times the number of multiprocessors as specified by the device attribute \texttt{CU\_DEVICE\_ATTRIBUTE\_MULTIPROCESSOR\_COUNT}. Since the total number of blocks launched per device has to match across all devices, the maximum number of blocks that can be launched per device will be limited by the device with the least number of multiprocessors.

The kernels cannot make use of CUDA dynamic parallelism.
The CUDA_LAUNCH_PARAMS structure is defined as:

```c
typedef struct CUDA_LAUNCH_PARAMS_st
{
    CUfunction function;
    unsigned int gridDimX;
    unsigned int gridDimY;
    unsigned int gridDimZ;
    unsigned int blockDimX;
    unsigned int blockDimY;
    unsigned int blockDimZ;
    unsigned int sharedMemBytes;
    CUstream hStream;
    void **kernelParams;
} CUDA_LAUNCH_PARAMS;
```

where:

- **CUDA_LAUNCH_PARAMS::function** specifies the kernel to be launched. All functions must be identical with respect to the compiled code.
- **CUDA_LAUNCH_PARAMS::gridDimX** is the width of the grid in blocks. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::gridDimY** is the height of the grid in blocks. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::gridDimZ** is the depth of the grid in blocks. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::blockDimX** is the X dimension of each thread block. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::blockDimY** is the Y dimension of each thread block. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::blockDimZ** is the Z dimension of each thread block. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::sharedMemBytes** is the dynamic shared-memory size per thread block in bytes. This must match across all kernels launched.
- **CUDA_LAUNCH_PARAMS::hStream** is the handle to the stream to perform the launch in. This cannot be the NULL stream or CU_STREAM_LEGACY or CU_STREAM_PER_THREAD. The CUDA context associated with this stream must match that associated with CUDA_LAUNCH_PARAMS::function.
- **CUDA_LAUNCH_PARAMS::kernelParams** is an array of pointers to kernel parameters. If CUDA_LAUNCH_PARAMS::function has N parameters, then CUDA_LAUNCH_PARAMS::kernelParams needs to be an array of N pointers. Each of CUDA_LAUNCH_PARAMS::kernelParams[0] through CUDA_LAUNCH_PARAMS::kernelParams[N-1] must point to a region of memory from which the actual kernel parameter will be copied. The number of kernel parameters and their offsets and sizes do not need to be specified as that information is retrieved directly from the kernel's image.

By default, the kernel won't begin execution on any GPU until all prior work in all the specified streams has completed. This behavior can be overridden by specifying the
flag **CUDA_COOPERATIVE_LAUNCH_MULTI_DEVICE_NO_PRE_LAUNCH_SYNC.** When this flag is specified, each kernel will only wait for prior work in the stream corresponding to that GPU to complete before it begins execution.

Similarly, by default, any subsequent work pushed in any of the specified streams will not begin execution until the kernels on all GPUs have completed. This behavior can be overridden by specifying the flag **CUDA_COOPERATIVE_LAUNCH_MULTI_DEVICE_NO_POST_LAUNCH_SYNC.** When this flag is specified, any subsequent work pushed in any of the specified streams will only wait for the kernel launched on the GPU corresponding to that stream to complete before it begins execution.

Calling **cuLaunchCooperativeKernelMultiDevice()** sets persistent function state that is the same as function state set through **cuLaunchKernel** API when called individually for each element in **launchParamsList**.

When kernels are launched via **cuLaunchCooperativeKernelMultiDevice()**, the previous block shape, shared size and parameter info associated with each **CUDA_LAUNCH_PARAMS::function** in **launchParamsList** is overwritten.

Note that to use **cuLaunchCooperativeKernelMultiDevice()**, the kernels must either have been compiled with toolchain version 3.2 or later so that it will contain kernel parameter information, or have no kernel parameters. If either of these conditions is not met, then **cuLaunchCooperativeKernelMultiDevice()** will return **CUDA_ERROR_INVALID_IMAGE**.

- This function uses standard **default stream** semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

**CUresult cuLaunchHostFunc (CUstream hStream, CUhostFn fn, void *userData)**

Enqueues a host function call in a stream.

**Parameters**

**hStream**
- Stream to enqueue function call in
fn
- The function to call once preceding stream operations are complete

userData
- User-specified data to be passed to the function

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_SUPPORTED

Description
Enqueues a host function to run in a stream. The function will be called after currently enqueued work and will block work added after it.

The host function must not make any CUDA API calls. Attempting to use a CUDA API may result in CUDA_ERROR_NOT_PERMITTED, but this is not required. The host function must not perform any synchronization that may depend on outstanding CUDA work not mandated to run earlier. Host functions without a mandated order (such as in independent streams) execute in undefined order and may be serialized.

For the purposes of Unified Memory, execution makes a number of guarantees:

- The stream is considered idle for the duration of the function's execution. Thus, for example, the function may always use memory attached to the stream it was enqueued in.
- The start of execution of the function has the same effect as synchronizing an event recorded in the same stream immediately prior to the function. It thus synchronizes streams which have been "joined" prior to the function.
- Adding device work to any stream does not have the effect of making the stream active until all preceding host functions and stream callbacks have executed. Thus, for example, a function might use global attached memory even if work has been added to another stream, if the work has been ordered behind the function call with an event.
- Completion of the function does not cause a stream to become active except as described above. The stream will remain idle if no device work follows the function, and will remain idle across consecutive host functions or stream callbacks without device work in between. Thus, for example, stream synchronization can be done by signaling from a host function at the end of the stream.

Note that, in contrast to cuStreamAddCallback, the function will not be called in the event of an error in the CUDA context.

This function uses standard default stream semantics.
CUresult cuLaunchKernel (CUfunction f, unsigned int gridDimX, unsigned int gridDimY, unsigned int gridDimZ, unsigned int blockDimX, unsigned int blockDimY, unsigned int blockDimZ, unsigned int sharedMemBytes, CUstream hStream, void **kernelParams, void **extra)

Launches a CUDA function.

Parameters

f
- Kernel to launch
gridDimX
  - Width of grid in blocks
gridDimY
  - Height of grid in blocks
gridDimZ
  - Depth of grid in blocks
blockDimX
  - X dimension of each thread block
blockDimY
  - Y dimension of each thread block
blockDimZ
  - Z dimension of each thread block
sharedMemBytes
  - Dynamic shared-memory size per thread block in bytes
hStream
  - Stream identifier
kernelParams
  - Array of pointers to kernel parameters
extra
  - Extra options
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_IMAGE, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_LAUNCH_FAILED, CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES, CUDA_ERROR_LAUNCH_TIMEOUT, CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING, CUDA_ERROR_SHARED_OBJECT_INIT_FAILED

Description

Invokes the kernel \( f \) on a \( \text{gridDimX} \times \text{gridDimY} \times \text{gridDimZ} \) grid of blocks. Each block contains \( \text{blockDimX} \times \text{blockDimY} \times \text{blockDimZ} \) threads.

\( \text{sharedMemBytes} \) sets the amount of dynamic shared memory that will be available to each thread block.

Kernel parameters to \( f \) can be specified in one of two ways:

1) Kernel parameters can be specified via \( \text{kernelParams} \). If \( f \) has \( N \) parameters, then \( \text{kernelParams} \) needs to be an array of \( N \) pointers. Each of \( \text{kernelParams}[0] \) through \( \text{kernelParams}[N-1] \) must point to a region of memory from which the actual kernel parameter will be copied. The number of kernel parameters and their offsets and sizes do not need to be specified as that information is retrieved directly from the kernel’s image.

2) Kernel parameters can also be packaged by the application into a single buffer that is passed in via the \( \text{extra} \) parameter. This places the burden on the application of knowing each kernel parameter’s size and alignment/padding within the buffer. Here is an example of using the \( \text{extra} \) parameter in this manner:

```c
size_t argBufferSize;
char argBuffer[256];

// populate argBuffer and argBufferSize

void *config[] = {
    CU_LAUNCH_PARAM_BUFFER_POINTER, argBuffer,
    CU_LAUNCH_PARAM_BUFFER_SIZE, &argBufferSize,
    CU_LAUNCH_PARAM_END
};
status = cuLaunchKernel(f, gx, gy, gz, bx, by, bz, sh, s, NULL, config);
```

The \( \text{extra} \) parameter exists to allow \text{cuLaunchKernel} to take additional less commonly used arguments. \( \text{extra} \) specifies a list of names of extra settings and their corresponding values. Each extra setting name is immediately followed by the corresponding value. The list must be terminated with either NULL or \text{CU_LAUNCH_PARAM_END}.

- \text{CU_LAUNCH_PARAM_END}, which indicates the end of the \text{extra} array;
CU_LAUNCH_PARAM_BUFFER_POINTER, which specifies that the next value in extra will be a pointer to a buffer containing all the kernel parameters for launching kernel $f$;

CU_LAUNCH_PARAM_BUFFER_SIZE, which specifies that the next value in extra will be a pointer to a size_t containing the size of the buffer specified with CU_LAUNCH_PARAM_BUFFER_POINTER;

The error CUDA_ERROR_INVALID_VALUE will be returned if kernel parameters are specified with both kernelParams and extra (i.e. both kernelParams and extra are non-NULL).

Calling cuLaunchKernel() sets persistent function state that is the same as function state set through the following deprecated APIs: cuFuncSetBlockSize(), cuFuncSetSharedSize(), cuParamSetSize(), cuParamSeti(), cuParamSetf(), cuParamSetv().

When the kernel $f$ is launched via cuLaunchKernel(), the previous block shape, shared size and parameter info associated with $f$ is overwritten.

Note that to use cuLaunchKernel(), the kernel $f$ must either have been compiled with toolchain version 3.2 or later so that it will contain kernel parameter information, or have no kernel parameters. If either of these conditions is not met, then cuLaunchKernel() will return CUDA_ERROR_INVALID_IMAGE.

This function uses standard default stream semantics.

Note that this function may also return error codes from previous, asynchronous launches.

5.18. Execution Control [DEPRECATED]

This section describes the deprecated execution control functions of the low-level CUDA driver application programming interface.
CUresult cuFuncSetBlockShape (CUfunction hfunc, int x, int y, int z)
Sets the block-dimensions for the function.

Parameters

hfunc
- Kernel to specify dimensions of
x
- X dimension
y
- Y dimension
z
- Z dimension

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Specifies the x, y, and z dimensions of the thread blocks that are created when the
kernel given by hfunc is launched.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuFuncSetSharedSize, cuFuncSetCacheConfig, cuFuncGetAttribute, cuParamSetSize,
cuParamSeti, cuParamSetf, cuParamSetv, cuLaunch, cuLaunchGrid,
cuLaunchGridAsync, cuLaunchKernel
CUresult cuFuncSetSharedSize (CUfunction hfunc, unsigned int bytes)
Sets the dynamic shared-memory size for the function.

Parameters

hfunc
- Kernel to specify dynamic shared-memory size for
bytes
- Dynamic shared-memory size per thread in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE

Description

Deprecated
Sets through bytes the amount of dynamic shared memory that will be available to
each thread block when the kernel given by hfunc is launched.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuFuncSetBlockShape, cuFuncSetCacheConfig, cuFuncGetAttribute,
cuParamSetSize, cuParamSeti, cuParamSetf, cuParamSetv, cuLaunch, cuLaunchGrid,
cuLaunchGridAsync, cuLaunchKernel

CUresult cuLaunch (CUfunction f)
Launches a CUDA function.

Parameters

f
- Kernel to launch
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_LAUNCH_FAILED,
CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES,
CUDA_ERROR_LAUNCH_TIMEOUT,
CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING,
CUDA_ERROR_SHARED_OBJECT_INIT_FAILED

Description
Deprecated

Invokes the kernel \( f \) on a 1 x 1 x 1 grid of blocks. The block contains the number of threads specified by a previous call to cuFuncSetBlockShape()

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuFuncSetBlockShape, cuFuncSetSharedSize, cuFuncGetAttribute, cuParamSetSize, cuParamSetf, cuParamSeti, cuParamSetv, cuLaunchGrid, cuLaunchGridAsync, cuLaunchKernel

CUresult cuLaunchGrid (CUfunction f, int grid_width, int grid_height)
Launches a CUDA function.

Parameters
f
- Kernel to launch
grid_width
- Width of grid in blocks
grid_height
- Height of grid in blocks

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_LAUNCH_FAILED,
CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES,
CUDA_ERROR_LAUNCH_TIMEOUT,
CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING,
CUDA_ERROR_SHARED_OBJECT_INIT_FAILED

Description

Deprecated

Invokes the kernel $f$ on a \texttt{grid_width} \times \texttt{grid_height} grid of blocks. Each block contains the number of threads specified by a previous call to \texttt{cuFuncSetBlockShape}.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuFuncSetBlockShape, cuFuncSetSharedSize, cuFuncGetAttribute, cuParamSetSize, cuParamSetf, cuParamSeti, cuParamSetv, cuLaunch, cuLaunchGridAsync, cuLaunchKernel

CUresult cuLaunchGridAsync (CUfunction f, int grid_width, int grid_height, CUstream hStream)

Launches a CUDA function.

Parameters

\texttt{f}

- Kernel to launch

\texttt{grid_width}

- Width of grid in blocks

\texttt{grid_height}

- Height of grid in blocks

\texttt{hStream}

- Stream identifier

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_LAUNCH_FAILED,
CUDA_ERROR_LAUNCH_OUT_OF_RESOURCES,
CUDA_ERROR_LAUNCH_TIMEOUT,
CUDA_ERROR_LAUNCH_INCOMPATIBLE_TEXTURING, CUDA_ERROR_SHARED_OBJECT_INIT_FAILED

Description

Deprecated

Invokes the kernel f on a grid_width x grid_height grid of blocks. Each block contains the number of threads specified by a previous call to cuFuncSetBlockShape().

- In certain cases where cubins are created with no ABI (i.e., using ptxas --abi-compile no), this function may serialize kernel launches. In order to force the CUDA driver to retain asynchronous behavior, set the CU_CTX_LMEM_RESIZE_TO_MAX flag during context creation (see cuCtxCreate).
- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuFuncSetBlockShape, cuFuncSetSharedSize, cuFuncGetAttribute, cuParamSetSize, cuParamSetf, cuParamSeti, cuParamSetv, cuLaunch, cuLaunchGrid, cuLaunchKernel

CUresult cuParamSetf (CUfunction hfunc, int offset, float value)

Adds a floating-point parameter to the function’s argument list.

Parameters

hfunc
- Kernel to add parameter to

offset
- Offset to add parameter to argument list

value
- Value of parameter

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE
Description
Deprecated
Sets a floating-point parameter that will be specified the next time the kernel corresponding to hfunc will be invoked. offset is a byte offset.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuFuncSetBlockShape, cuFuncSetSharedSize, cuFuncGetAttribute, cuParamSetSize, cuParamSeti, cuParamSetv, cuLaunch, cuLaunchGrid, cuLaunchGridAsync, cuLaunchKernel

CUresult cuParamSeti (CUfunction hfunc, int offset, unsigned int value)
Adds an integer parameter to the function’s argument list.

Parameters

hfunc
- Kernel to add parameter to
offset
- Offset to add parameter to argument list
value
- Value of parameter

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Sets an integer parameter that will be specified the next time the kernel corresponding to hfunc will be invoked. offset is a byte offset.

Note that this function may also return error codes from previous, asynchronous launches.
See also:
cuParamSetf, cuParamSeti, cuParamSetv, cuLaunch, cuLaunchGrid, cuLaunchGridAsync, cuLaunchKernel

CUresult cuParamSetSize (CUfunction hfunc, unsigned int numbytes)
Sets the parameter size for the function.

Parameters

hfunc
- Kernel to set parameter size for
numbytes
- Size of parameter list in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Sets through numbytes the total size in bytes needed by the function parameters of the kernel corresponding to hfunc.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuParamSetf, cuParamSeti, cuParamSetv, cuLaunch, cuLaunchGrid, cuLaunchGridAsync, cuLaunchKernel
CUresult cuParamSetTexRef (CUfunction hfunc, int texunit, CUtexref hTexRef)

Adds a texture-reference to the function's argument list.

**Parameters**

- **hfunc**
  - Kernel to add texture-reference to
- **texunit**
  - Texture unit (must be `CU_PARAM_TR_DEFAULT`)
- **hTexRef**
  - Texture-reference to add to argument list

**Returns**

- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

**Description**

Deprecated

Makes the CUDA array or linear memory bound to the texture reference `hTexRef` available to a device program as a texture. In this version of CUDA, the texture-reference must be obtained via `cuModuleGetTexRef()` and the `texunit` parameter must be set to `CU_PARAM_TR_DEFAULT`.

Note that this function may also return error codes from previous, asynchronous launches.

CUresult cuParamSetv (CUfunction hfunc, int offset, void *ptr, unsigned int numbytes)

Adds arbitrary data to the function's argument list.

**Parameters**

- **hfunc**
  - Kernel to add data to
- **offset**
  - Offset to add data to argument list
ptr
- Pointer to arbitrary data

numbytes
- Size of data to copy in bytes

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Copies an arbitrary amount of data (specified in numbytes) from ptr into the parameter space of the kernel corresponding to hfunc. offset is a byte offset.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuFuncSetBlockShape, cuFuncSetSharedSize, cuFuncGetAttribute, cuParamSetSize,
cuParamSetf, cuParamSeti, cuLaunch, cuLaunchGrid, cuLaunchGridAsync,
cuLaunchKernel

5.19. Graph Management
This section describes the graph management functions of the low-level CUDA driver application programming interface.

CUresult cuGraphAddChildGraphNode (CUgraphNode *phGraphNode, CUgraph hGraph, const CUgraphNode *dependencies, size_t numDependencies, CUgraph childGraph)
Creates a child graph node and adds it to a graph.

Parameters
phGraphNode
- Returns newly created node
hGraph
  - Graph to which to add the node
dependencies
  - Dependencies of the node
numDependencies
  - Number of dependencies
childGraph
  - The graph to clone into this node

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,

Description
Creates a new node which executes an embedded graph, and adds it to hGraph with
numDependencies dependencies specified via dependencies. It is possible for
numDependencies to be 0, in which case the node will be placed at the root of the
graph. dependencies may not have any duplicate entries. A handle to the new node
will be returned in phGraphNode.

The node executes an embedded child graph. The child graph is cloned in this call.

➤ Graph objects are not threadsafe. More here.
➤ Note that this function may also return error codes from previous, asynchronous
  launches.

See also:
cuGraphChildGraphNodeGetGraph, cuGraphCreate, cuGraphDestroyNode,
cuGraphAddEmptyNode, cuGraphAddKernelNode, cuGraphAddHostNode,
cuGraphAddMemcpyNode, cuGraphAddMemsetNode, cuGraphClone

CUresult cuGraphAddDependencies (CUgraph hGraph,
const CUgraphNode *from, const CUgraphNode *to,
size_t numDependencies)
Adds dependency edges to a graph.

Parameters
hGraph
  - Graph to which dependencies are added
from
  - Array of nodes that provide the dependencies
to
  - Array of dependent nodes
numDependencies
  - Number of dependencies to be added

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE

Description
The number of dependencies to be added is defined by numDependencies. Elements in from and to at corresponding indices define a dependency. Each node in from and to must belong to hGraph.

If numDependencies is 0, elements in from and to will be ignored. Specifying an existing dependency will return an error.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphRemoveDependencies, cuGraphGetEdges, cuGraphNodeGetDependencies, cuGraphNodeGetDependentNodes

CUresult cuGraphAddEmptyNode (CUgraphNode *phGraphNode, CUgraph hGraph, const CUgraphNode *dependencies, size_t numDependencies)
Creates an empty node and adds it to a graph.

Parameters
phGraphNode
  - Returns newly created node
hGraph
  - Graph to which to add the node
dependencies
  - Dependencies of the node
numDependencies
  - Number of dependencies

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,

Description
Creates a new node which performs no operation, and adds it to hGraph with
numDependencies dependencies specified via dependencies. It is possible for
numDependencies to be 0, in which case the node will be placed at the root of the
graph. dependencies may not have any duplicate entries. A handle to the new node
will be returned in phGraphNode.

An empty node performs no operation during execution, but can be used for transitive
ordering. For example, a phased execution graph with 2 groups of n nodes with a barrier
between them can be represented using an empty node and 2*n dependency edges,
rather than no empty node and n^2 dependency edges.

 › Graph objects are not threadsafe. More here.
 › Note that this function may also return error codes from previous, asynchronous
   launches.

See also:
cuGraphCreate, cuGraphDestroyNode, cuGraphAddChildGraphNode,
cuGraphAddKernelNode, cuGraphAddHostNode, cuGraphAddMemcpyNode,
cuGraphAddMemsetNode

CUresult cuGraphAddHostNode (CUgraphNode *phGraphNode, CUgraph hGraph, const CUgraphNode *dependencies, size_t numDependencies, const CUDA_HOST_NODE_PARAMS *nodeParams)
Creates a host execution node and adds it to a graph.

Parameters
phGraphNode
  - Returns newly created node
hGraph
  - Graph to which to add the node
dependencies
- Dependencies of the node

numDependencies
- Number of dependencies

nodeParams
- Parameters for the host node

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_NOT_SUPPORTED,
CUDA_ERROR_INVALID_VALUE

Description

Creates a new CPU execution node and adds it to hGraph with numDependencies dependencies specified via dependencies and arguments specified in nodeParams. It is possible for numDependencies to be 0, in which case the node will be placed at the root of the graph. dependencies may not have any duplicate entries. A handle to the new node will be returned in phGraphNode.

When the graph is launched, the node will invoke the specified CPU function. Host nodes are not supported under MPS with pre-Volta GPUs.

See also:
cuLaunchHostFunc, cuGraphHostNodeGetParams, cuGraphHostNodeSetParams,
cuGraphCreate, cuGraphDestroyNode, cuGraphAddChildGraphNode,
cuGraphAddEmptyNode, cuGraphAddKernelNode, cuGraphAddMemcpyNode,
cuGraphAddMemsetNode

CUresult cuGraphAddKernelNode (CUgraphNode
*phGraphNode, CUgraph hGraph, const CUgraphNode
*dependencies, size_t numDependencies, const CUDA_KERNEL_NODE_PARAMS *nodeParams)

Creates a kernel execution node and adds it to a graph.

Parameters

phGraphNode
- Returns newly created node

hGraph
- Graph to which to add the node
dependencies
- Dependencies of the node
numDependencies
- Number of dependencies
nodeParams
- Parameters for the GPU execution node

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Creates a new kernel execution node and adds it to hGraph with numDependencies dependencies specified via dependencies and arguments specified in nodeParams. It is possible for numDependencies to be 0, in which case the node will be placed at the root of the graph. dependencies may not have any duplicate entries. A handle to the new node will be returned in phGraphNode.

The CUDA_KERNEL_NODE_PARAMS structure is defined as:

```c
typedef struct CUDA_KERNEL_NODE_PARAMS_st {
    CUfunction func;
    unsigned int gridDimX;
    unsigned int gridDimY;
    unsigned int gridDimZ;
    unsigned int blockDimX;
    unsigned int blockDimY;
    unsigned int blockDimZ;
    unsigned int sharedMemBytes;
    void **kernelParams;
    void **extra;
} CUDA_KERNEL_NODE_PARAMS;
```

When the graph is launched, the node will invoke kernel func on a (gridDimX x gridDimY x gridDimZ) grid of blocks. Each block contains (blockDimX x blockDimY x blockDimZ) threads.

sharedMemBytes sets the amount of dynamic shared memory that will be available to each thread block.
Kernel parameters to `func` can be specified in one of two ways:

1) Kernel parameters can be specified via `kernelParams`. If the kernel has N parameters, then `kernelParams` needs to be an array of N pointers. Each pointer, from `kernelParams[0]` to `kernelParams[N-1]`, points to the region of memory from which the actual parameter will be copied. The number of kernel parameters and their offsets and sizes do not need to be specified as that information is retrieved directly from the kernel's image.

2) Kernel parameters can also be packaged by the application into a single buffer that is passed in via `extra`. This places the burden on the application of knowing each kernel parameter's size and alignment/padding within the buffer. The `extra` parameter exists to allow this function to take additional less commonly used arguments. `extra` specifies a list of names of extra settings and their corresponding values. Each extra setting name is immediately followed by the corresponding value. The list must be terminated with either NULL or `CU_LAUNCH_PARAM_END`.

- `CU_LAUNCH_PARAM_END`, which indicates the end of the `extra` array;
- `CU_LAUNCH_PARAM_BUFFER_POINTER`, which specifies that the next value in `extra` will be a pointer to a buffer containing all the kernel parameters for launching kernel `func`;
- `CU_LAUNCH_PARAM_BUFFER_SIZE`, which specifies that the next value in `extra` will be a pointer to a size_t containing the size of the buffer specified with `CU_LAUNCH_PARAM_BUFFER_POINTER`;

The error `CUDA_ERROR_INVALID_VALUE` will be returned if kernel parameters are specified with both `kernelParams` and `extra` (i.e. both `kernelParams` and `extra` are non-NULL).

The `kernelParams` or `extra` array, as well as the argument values it points to, are copied during this call.

Kernels launched using graphs must not use texture and surface references. Reading or writing through any texture or surface reference is undefined behavior. This restriction does not apply to texture and surface objects.

Graph objects are not threadsafe. More here.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphAddMemcpyNode

CUresult cuGraphAddMemcpyNode (CUgraphNode *phGraphNode, CUgraph hGraph, const CUgraphNode *dependencies, size_t numDependencies, const CUDA_MEMCPY3D *copyParams, CUcontext ctx)

Creates a memcpy node and adds it to a graph.

Parameters

phGraphNode
- Returns newly created node

hGraph
- Graph to which to add the node

dependencies
- Dependencies of the node

numDependencies
- Number of dependencies

copyParams
- Parameters for the memory copy

ctx
- Context on which to run the node

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Creates a new memcpy node and adds it to hGraph with numDependencies dependencies specified via dependencies. It is possible for numDependencies to be 0, in which case the node will be placed at the root of the graph. dependencies may not have any duplicate entries. A handle to the new node will be returned in phGraphNode.

When the graph is launched, the node will perform the memcpy described by copyParams. See cuMemcpy3D() for a description of the structure and its restrictions.

Memcpy nodes have some additional restrictions with regards to managed memory, if the system contains at least one device which has a zero value for the device attribute CU_DEVICE_ATTRIBUTE_CONCURRENT_MANAGED_ACCESS. If one or more of the operands refer to managed memory, then using the memory type CU_MEMORYTYPE_UNIFIED is disallowed for those operand(s). The managed
memory will be treated as residing on either the host or the device, depending on which memory type is specified.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

cuMemcpy3D, cuGraphMemcpyNodeGetParams, cuGraphMemcpyNodeSetParams, cuGraphCreate, cuGraphDestroyNode, cuGraphAddChildGraphNode, cuGraphAddEmptyNode, cuGraphAddKernelNode, cuGraphAddHostNode, cuGraphAddMemsetNode

CUresult cuGraphAddMemsetNode (CUgraphNode *phGraphNode, CUgraph hGraph, const CUgraphNode *dependencies, size_t numDependencies, const CUDA_MEMSET_NODE_PARAMS *memsetParams, CUcontext ctx)

Creates a memset node and adds it to a graph.

Parameters

phGraphNode
  - Returns newly created node
hGraph
  - Graph to which to add the node
dependencies
  - Dependencies of the node
numDependencies
  - Number of dependencies
memsetParams
  - Parameters for the memory set
ctx
  - Context on which to run the node

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_CONTEXT
Description

Creates a new memset node and adds it to hGraph with numDependencies dependencies specified via dependencies. It is possible for numDependencies to be 0, in which case the node will be placed at the root of the graph. dependencies may not have any duplicate entries. A handle to the new node will be returned in phGraphNode.

The element size must be 1, 2, or 4 bytes. When the graph is launched, the node will perform the memset described by memsetParams.

‣ Graph objects are not threadsafe. More here.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuMemsetD2D32, cuGraphMemsetNodeGetParams, cuGraphMemsetNodeSetParams, cuGraphCreate, cuGraphDestroyNode, cuGraphAddChildGraphNode, cuGraphAddEmptyNode, cuGraphAddKernelNode, cuGraphAddHostNode, cuGraphAddMemcpyNode

CUresult cuGraphChildGraphNodeGetGraph (CUgraphNode hNode, CUgraph *phGraph)

Gets a handle to the embedded graph of a child graph node.

Parameters

hNode
  - Node to get the embedded graph for

phGraph
  - Location to store a handle to the graph

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,

Description

Gets a handle to the embedded graph in a child graph node. This call does not clone the graph. Changes to the graph will be reflected in the node, and the node retains ownership of the graph.
CUresult cuGraphClone (CUgraph *phGraphClone, CUgraph originalGraph)

Clones a graph.

Parameters

- phGraphClone: Returns newly created cloned graph
- originalGraph: Graph to clone

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

Description

This function creates a copy of originalGraph and returns it in *phGraphClone. All parameters are copied into the cloned graph. The original graph may be modified after this call without affecting the clone.

Child graph nodes in the original graph are recursively copied into the clone.
CUresult cuGraphCreate (CUgraph *phGraph, unsigned int flags)
Creates a graph.

Parameters

phGraph
- Returns newly created graph
flags
- Graph creation flags, must be 0

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY

Description

Creates an empty graph, which is returned via phGraph.

▶ Graph objects are not threadsafe. More here.
▶ Note that this function may also return error codes from previous, asynchronous launches.

cuGraphInstantiate, cuGraphDestroy, cuGraphGetNodes, cuGraphGetRootNodes,
cuGraphGetEdges, cuGraphClone

CUresult cuGraphDestroy (CUgraph hGraph)
Destroys a graph.

Parameters

hGraph
- Graph to destroy
CUDA Driver API

TRM-06703-001 _vRelease Version | 274

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Destroys the graph specified by hGraph, as well as all of its nodes.

‣ Graph objects are not threadsafe. More here.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphCreate

CUresult cuGraphDestroyNode (CUgraphNode hNode)
Remove a node from the graph.

Parameters
hNode
- Node to remove

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE

Description
Removes hNode from its graph. This operation also severs any dependencies of other nodes on hNode and vice versa.

‣ Graph objects are not threadsafe. More here.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphAddChildGraphNode, cuGraphAddEmptyNode, cuGraphAddKernelNode, cuGraphAddHostNode, cuGraphAddMemcpyNode, cuGraphAddMemsetNode
CUresult cuGraphExecDestroy (CUgraphExec hGraphExec)
Destroys an executable graph.

Parameters
hGraphExec
- Executable graph to destroy

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Destroys the executable graph specified by hGraphExec, as well as all of its executable
nodes. If the executable graph is in-flight, it will not be terminated, but rather freed
asynchronously on completion.

Graph objects are not threadsafe. More here.
Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuGraphInstantiate, cuGraphLaunch

CUresult cuGraphExecKernelNodeSetParams
(CUgraphExec hGraphExec, CUgraphNode hNode, const
CUDA_KERNEL_NODE_PARAMS *nodeParams)
Sets the parameters for a kernel node in the given graphExec.

Parameters
hGraphExec
- The executable graph in which to set the specified node
hNode
- kernel node from the graph from which graphExec was instantiated
nodeParams
- Updated Parameters to set
Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,

Description

Sets the parameters of a kernel node in an executable graph `hGraphExec`. The node is identified by the corresponding node `hNode` in the non-executable graph, from which the executable graph was instantiated.

`hNode` must not have been removed from the original graph. The `func` field of `nodeParams` cannot be modified and must match the original value. All other values can be modified.

The modifications take effect at the next launch of `hGraphExec`. Already enqueued or running launches of `hGraphExec` are not affected by this call. `hNode` is also not modified by this call.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphAddKernelNode, cuGraphKernelNodeSetParams, cuGraphInstantiate

CUresult cuGraphGetEdges (CUgraph hGraph, CUgraphNode *from, CUgraphNode *to, size_t *numEdges)

Returns a graph's dependency edges.

Parameters

hGraph
  - Graph to get the edges from
from
  - Location to return edge endpoints
to
  - Location to return edge endpoints
numEdges
  - See description
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Returns a list of hGraph's dependency edges. Edges are returned via corresponding indices in from and to; that is, the node in to[i] has a dependency on the node in from[i]. from and to may both be NULL, in which case this function only returns the number of edges in numEdges. Otherwise, numEdges entries will be filled in. If numEdges is higher than the actual number of edges, the remaining entries in from and to will be set to NULL, and the number of edges actually returned will be written to numEdges.

‣ Graph objects are not threadsafe. More here.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphGetNodes, cuGraphGetRootNodes, cuGraphAddDependencies, cuGraphRemoveDependencies, cuGraphNodeGetDependencies, cuGraphNodeGetDependentNodes

CUresult cuGraphGetNodes (CUgraph hGraph, CUgraphNode *nodes, size_t *numNodes)

Returns a graph's nodes.

Parameters

hGraph
  - Graph to query

nodes
  - Pointer to return the nodes

numNodes
  - See description

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE
**Description**

Returns a list of hGraph's nodes. nodes may be NULL, in which case this function will return the number of nodes in numNodes. Otherwise, numNodes entries will be filled in. If numNodes is higher than the actual number of nodes, the remaining entries in nodes will be set to NULL, and the number of nodes actually obtained will be returned in numNodes.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

**See also:**

cuGraphCreate, cuGraphGetRootNodes, cuGraphGetEdges, cuGraphNodeGetType, cuGraphNodeGetDependencies, cuGraphNodeGetDependentNodes

**CUresult cuGraphGetRootNodes (CUgraph hGraph, CUGraphNode *rootNodes, size_t *numRootNodes)**

Returns a graph's root nodes.

**Parameters**

hGraph
- Graph to query

rootNodes
- Pointer to return the root nodes

numRootNodes
- See description

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

**Description**

Returns a list of hGraph's root nodes. rootNodes may be NULL, in which case this function will return the number of root nodes in numRootNodes. Otherwise, numRootNodes entries will be filled in. If numRootNodes is higher than the actual number of root nodes, the remaining entries in rootNodes will be set to NULL, and the number of nodes actually obtained will be returned in numRootNodes.
Graph objects are not threadsafe. More here.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphCreate, cuGraphGetNodes, cuGraphGetEdges, cuGraphNodeGetType, cuGraphNodeGetDependencies, cuGraphNodeGetDependentNodes

CUresult cuGraphHostNodeGetParams (CUgraphNode hNode, CUDA_HOST_NODE_PARAMS *nodeParams)
Returns a host node’s parameters.

Parameters

hNode
- Node to get the parameters for

nodeParams
- Pointer to return the parameters

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Returns the parameters of host node hNode in nodeParams.

Graph objects are not threadsafe. More here.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuLaunchHostFunc, cuGraphAddHostNode, cuGraphHostNodeSetParams
CUresult cuGraphHostNodeSetParams (CUgraphNode hNode, const CUDA_HOST_NODE_PARAMS *nodeParams)
Sets a host node’s parameters.

Parameters
hNode
- Node to set the parameters for
nodeParams
- Parameters to copy

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Sets the parameters of host node hNode to nodeParams.

See also:
cuLaunchHostFunc, cuGraphAddHostNode, cuGraphHostNodeGetParams

CUresult cuGraphInstantiate (CUgraphExec *phGraphExec, CUgraph hGraph, CUgraphNode *phErrorNode, char *logBuffer, size_t bufferSize)
Creates an executable graph from a graph.

Parameters
phGraphExec
- Returns instantiated graph
hGraph
- Graph to instantiate
phErrorNode
- In case of an instantiation error, this may be modified to indicate a node contributing to the error
logBuffer
- A character buffer to store diagnostic messages

bufferSize
- Size of the log buffer in bytes

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Instantiates hGraph as an executable graph. The graph is validated for any structural
constraints or intra-node constraints which were not previously validated. If
instantiation is successful, a handle to the instantiated graph is returned in graphExec.

If there are any errors, diagnostic information may be returned in errorNode and
logBuffer. This is the primary way to inspect instantiation errors. The output will
be null terminated unless the diagnostics overflow the buffer. In this case, they will be
truncated, and the last byte can be inspected to determine if truncation occurred.

Graph objects are not thread safe. More here.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuGraphCreate, cuGraphLaunch, cuGraphExecDestroy

CUresult cuGraphKernelNodeGetParams (CUgraphNode hNode,
CUDA_KERNEL_NODE_PARAMS *nodeParams)
Returns a kernel node's parameters.

Parameters
hNode
- Node to get the parameters for
nodeParams
- Pointer to return the parameters

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE
Description

Returns the parameters of kernel node \texttt{hNode} in \texttt{nodeParams}. The \texttt{kernelParams} or \texttt{extra} array returned in \texttt{nodeParams}, as well as the argument values it points to, are owned by the node. This memory remains valid until the node is destroyed or its parameters are modified, and should not be modified directly. Use \texttt{cuGraphKernelNodeSetParams} to update the parameters of this node.

The params will contain either \texttt{kernelParams} or \texttt{extra}, according to which of these was most recently set on the node.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:
\texttt{cuLaunchKernel}, \texttt{cuGraphAddKernelNode}, \texttt{cuGraphKernelNodeSetParams}

\texttt{CUresult cuGraphKernelNodeSetParams (CUgraphNode hNode, const CUDA_KERNEL_NODE_PARAMS *nodeParams)}

Sets a kernel node’s parameters.

Parameters

- \texttt{hNode} - Node to set the parameters for
- \texttt{nodeParams} - Parameters to copy

Returns

\texttt{CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_OUT_OF_MEMORY}

Description

Sets the parameters of kernel node \texttt{hNode} to \texttt{nodeParams}.

- Graph objects are not threadsafe. More here.
CUresult cuGraphLaunch (CUgraphExec hGraphExec, CUstream hStream)
Launches an executable graph in a stream.

Parameters

hGraphExec
- Executable graph to launch

hStream
- Stream in which to launch the graph

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Executes hGraphExec in hStream. Only one instance of hGraphExec may be executing at a time. Each launch is ordered behind both any previous work in hStream and any previous launches of hGraphExec. To execute a graph concurrently, it must be instantiated multiple times into multiple executable graphs.

Graph objects are not threadsafe. More here.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphInstantiate, cuGraphExecDestroy
CUresult cuGraphMemcpyNodeGetParams (CUgraphNode hNode, CUDA_MEMCPY3D *nodeParams)
Returns a memcpy node’s parameters.

Parameters

hNode
- Node to get the parameters for
nodeParams
- Pointer to return the parameters

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Returns the parameters of memcpy node hNode in nodeParams.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuMemcpy3D, cuGraphAddMemcpyNode, cuGraphMemcpyNodeSetParams

CUresult cuGraphMemcpyNodeSetParams (CUgraphNode hNode, const CUDA_MEMCPY3D *nodeParams)
Sets a memcpy node’s parameters.

Parameters

hNode
- Node to set the parameters for
nodeParams
- Parameters to copy

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
Description
Sets the parameters of memcpy node hNode to nodeParams.

‣ Graph objects are not threadsafe. More here.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuMemcpy3D, cuGraphAddMemcpyNode, cuGraphMemcpyNodeGetParams

CUresult cuGraphMemsetNodeGetParams (CUgraphNode hNode, CUDA_MEMSET_NODE_PARAMS *nodeParams)
Returns a memset node's parameters.

Parameters

hNode
- Node to get the parameters for
nodeParams
- Pointer to return the parameters

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Returns the parameters of memset node hNode in nodeParams.

‣ Graph objects are not threadsafe. More here.
‣ Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuMemsetD2D32, cuGraphAddMemsetNode, cuGraphMemsetNodeSetParams
CUresult cuGraphMemsetNodeSetParams (CUgraphNode hNode, const CUDA_MEMSET_NODE_PARAMS *nodeParams)
Sets a memset node's parameters.

Parameters

hNode
- Node to set the parameters for

nodeParams
- Parameters to copy

Returns

CU_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Sets the parameters of memset node hNode to nodeParams.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuMemsetD2D32, cuGraphAddMemsetNode, cuGraphMemsetNodeGetParams

CUresult cuGraphNodeFindInClone (CUgraphNode *phNode, CUgraphNode hOriginalNode, CUgraph hClonedGraph)
Finds a cloned version of a node.

Parameters

phNode
- Returns handle to the cloned node

hOriginalNode
- Handle to the original node

hClonedGraph
- Cloned graph to query
Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE,

Description
This function returns the node in \texttt{hClonedGraph} corresponding to \texttt{hOriginalNode} in the original graph.

\texttt{hClonedGraph} must have been cloned from \texttt{hOriginalGraph} via \texttt{cuGraphClone}. \texttt{hOriginalNode} must have been in \texttt{hOriginalGraph} at the time of the call to \texttt{cuGraphClone}, and the corresponding cloned node in \texttt{hClonedGraph} must not have been removed. The cloned node is then returned via \texttt{phClonedNode}.

See also:
cuGraphClone

\texttt{CUresult cuGraphNodeGetDependencies (CUgraphNode hNode, CUgraphNode *dependencies, size_t *numDependencies)}
Returns a node's dependencies.

Parameters
\texttt{hNode}
- Node to query
 dependencies
- Pointer to return the dependencies
 numDependencies
- See description

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description
Returns a list of node's dependencies. \texttt{dependencies} may be NULL, in which case this function will return the number of dependencies in \texttt{numDependencies}. 
Otherwise, `numDependencies` entries will be filled in. If `numDependencies` is higher than the actual number of dependencies, the remaining entries in `dependencies` will be set to NULL, and the number of nodes actually obtained will be returned in `numDependencies`.

Graph objects are not threadsafe. More here.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

- `cuGraphNodeGetDependentNodes`
- `cuGraphGetNodes`
- `cuGraphGetRootNodes`
- `cuGraphGetEdges`
- `cuGraphAddDependencies`
- `cuGraphRemoveDependencies`

CUresult cuGraphNodeGetDependentNodes
(CUgraphNode hNode, CUgraphNode *dependentNodes, size_t *numDependentNodes)

Returns a node's dependent nodes.

Parameters

- **hNode**
  - Node to query
- **dependentNodes**
  - Pointer to return the dependent nodes
- **numDependentNodes**
  - See description

Returns

- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
- CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Returns a list of node's dependent nodes. `dependentNodes` may be NULL, in which case this function will return the number of dependent nodes in `numDependentNodes`. Otherwise, `numDependentNodes` entries will be filled in. If `numDependentNodes` is higher than the actual number of dependent nodes, the remaining entries in `dependentNodes` will be set to NULL, and the number of nodes actually obtained will be returned in `numDependentNodes`. 
CUresult cuGraphNodeGetType (CUgraphNode hNode, CUgraphNodeType *type)

Returns a node’s type.

Parameters

hNode
- Node to query

type
- Pointer to return the node type

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE

Description

Returns the node type of hNode in type.

See also:

cuGraphNodeGetDependencies, cuGraphGetNodes, cuGraphGetRootNodes, cuGraphGetEdges, cuGraphAddDependencies, cuGraphRemoveDependencies
CUresult cuGraphRemoveDependencies (CUgraph hGraph, const CUgraphNode *from, const CUgraphNode *to, size_t numDependencies)
Removes dependency edges from a graph.

Parameters

**hGraph**
- Graph from which to remove dependencies

**from**
- Array of nodes that provide the dependencies

**to**
- Array of dependent nodes

**numDependencies**
- Number of dependencies to be removed

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_VALUE

Description

The number of dependencies to be removed is defined by numDependencies. Elements in from and to at corresponding indices define a dependency. Each node in from and to must belong to hGraph.

If numDependencies is 0, elements in from and to will be ignored. Specifying a non-existing dependency will return an error.

- Graph objects are not threadsafe. More here.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphAddDependencies, cuGraphGetEdges, cuGraphNodeGetDependencies, cuGraphNodeGetDependentNodes
5.20. Occupancy

This section describes the occupancy calculation functions of the low-level CUDA driver application programming interface.

CUresult cuOccupancyMaxActiveBlocksPerMultiprocessor (int *numBlocks, CUfunction func, int blockSize, size_t dynamicSMemSize)

Returns occupancy of a function.

Parameters

numBlocks
- Returned occupancy

func
- Kernel for which occupancy is calculated

blockSize
- Block size the kernel is intended to be launched with

dynamicSMemSize
- Per-block dynamic shared memory usage intended, in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_UNKNOWN

Description

Returns in *numBlocks the number of the maximum active blocks per streaming multiprocessor.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cudaOccupancyMaxActiveBlocksPerMultiprocessor
CUresult
cuOccupancyMaxActiveBlocksPerMultiprocessorWithFlags
(int *numBlocks, CUfunction func, int blockSize, size_t
dynamicSMemSize, unsigned int flags)
Returns occupancy of a function.

Parameters
numBlocks
- Returned occupancy
func
- Kernel for which occupancy is calculated
blockSize
- Block size the kernel is intended to be launched with
dynamicSMemSize
- Per-block dynamic shared memory usage intended, in bytes
flags
- Requested behavior for the occupancy calculator

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_UNKNOWN

Description
Returns in *numBlocks the number of the maximum active blocks per streaming multiprocessor.

The Flags parameter controls how special cases are handled. The valid flags are:

- **CU_OCCUPANCY_DEFAULT**, which maintains the default behavior as cuOccupancyMaxActiveBlocksPerMultiprocessor;

- **CU_OCCUPANCY_DISABLE_CACHING_OVERRIDE**, which suppresses the default behavior on platform where global caching affects occupancy. On such platforms, if caching is enabled, but per-block SM resource usage would result in zero occupancy, the occupancy calculator will calculate the occupancy as if caching is disabled. Setting **CU_OCCUPANCY_DISABLE_CACHING_OVERRIDE** makes the occupancy calculator to return 0 in such cases. More information can be found about this feature in the "Unified L1/Texture Cache" section of the Maxwell tuning guide.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cudaOccupancyMaxActiveBlocksPerMultiprocessorWithFlags

CUresult cuOccupancyMaxPotentialBlockSize (int *minGridSize, int *blockSize, CUfunction func, CUoccupancyB2DSize blockSizeToDynamicSMemSize, size_t dynamicSMemSize, int blockSizeLimit)

Suggest a launch configuration with reasonable occupancy.

Parameters

minGridSize
- Returned minimum grid size needed to achieve the maximum occupancy

blockSize
- Returned maximum block size that can achieve the maximum occupancy

func
- Kernel for which launch configuration is calculated

blockSizeToDynamicSMemSize
- A function that calculates how much per-block dynamic shared memory `func` uses based on the block size

dynamicSMemSize
- Dynamic shared memory usage intended, in bytes

blockSizeLimit
- The maximum block size `func` is designed to handle

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_UNKNOWN

Description

Returns in *blockSize a reasonable block size that can achieve the maximum occupancy (or, the maximum number of active warps with the fewest blocks per multiprocessor), and in *minGridSize the minimum grid size to achieve the maximum occupancy.
If `blockSizeLimit` is 0, the configurator will use the maximum block size permitted by the device / function instead.

If per-block dynamic shared memory allocation is not needed, the user should leave both `blockSizeToDynamicSMemSize` and `dynamicSMemSize` as 0.

If per-block dynamic shared memory allocation is needed, then if the dynamic shared memory size is constant regardless of block size, the size should be passed through `dynamicSMemSize`, and `blockSizeToDynamicSMemSize` should be NULL.

Otherwise, if the per-block dynamic shared memory size varies with different block sizes, the user needs to provide a unary function through `blockSizeToDynamicSMemSize` that computes the dynamic shared memory needed by `func` for any given block size. `dynamicSMemSize` is ignored. An example signature is:

```
// Take block size, returns dynamic shared memory needed
size_t blockToSmem(int blockSize);
```

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cudaOccupancyMaxPotentialBlockSize

CUresult cuOccupancyMaxPotentialBlockSizeWithFlags
(int *minGridSize, int *blockSize, CUfunction func,
CUoccupancyB2DSize blockSizeToDynamicSMemSize,
size_t dynamicSMemSize, int blockSizeLimit, unsigned int flags)

Suggest a launch configuration with reasonable occupancy.

**Parameters**

- `minGridSize` - Returned minimum grid size needed to achieve the maximum occupancy
- `blockSize` - Returned maximum block size that can achieve the maximum occupancy
- `func` - Kernel for which launch configuration is calculated
- `blockSizeToDynamicSMemSize` - A function that calculates how much per-block dynamic shared memory `func` uses based on the block size
**dynamicSMemSize**
- Dynamic shared memory usage intended, in bytes

**blockSizeLimit**
- The maximum block size `func` is designed to handle

**flags**
- Options

**Returns**
- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_UNKNOWN

**Description**
An extended version of `cuOccupancyMaxPotentialBlockSize`. In addition to arguments passed to `cuOccupancyMaxPotentialBlockSize`, `cuOccupancyMaxPotentialBlockSizeWithFlags` also takes a `Flags` parameter.

The `Flags` parameter controls how special cases are handled. The valid flags are:

- **CU_OCCUPANCY_DEFAULT**, which maintains the default behavior as `cuOccupancyMaxPotentialBlockSize`;

- **CU_OCCUPANCY_DISABLE_CACHING OVERRIDE**, which suppresses the default behavior on platform where global caching affects occupancy. On such platforms, the launch configurations that produces maximal occupancy might not support global caching. Setting `CU_OCCUPANCY_DISABLE_CACHING OVERRIDE` guarantees that the produced launch configuration is global caching compatible at a potential cost of occupancy. More information can be found about this feature in the "Unified L1/Texture Cache" section of the Maxwell tuning guide.

Note that this function may also return error codes from previous, asynchronous launches.

5.21. Texture Reference Management  
[DEPRECATED]

This section describes the deprecated texture reference management functions of the low-level CUDA driver application programming interface.

**CUresult cuTexRefCreate (CUtexref *pTexRef)**

Creates a texture reference.

**Parameters**

- **pTexRef** - Returned texture reference

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

**Description**

Deprecated

Creates a texture reference and returns its handle in *pTexRef. Once created, the application must call cuTexRefSetArray() or cuTexRefSetAddress() to associate the reference with allocated memory. Other texture reference functions are used to specify the format and interpretation (addressing, filtering, etc.) to be used when the memory is read through this texture reference.

**See also:**

cuTexRefDestroy

**CUresult cuTexRefDestroy (CUtexref hTexRef)**

Destroys a texture reference.

**Parameters**

- **hTexRef** - Texture reference to destroy
Returns

CUD_A_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Destroys the texture reference specified by hTexRef.

See also:

cuTexRefCreate

CUresult cuTexRefGetAddress (CUdeviceptr *pdptr, 
CUtextref hTexRef)

Gets the address associated with a texture reference.

Parameters

pdptr
  - Returned device address
hTexRef
  - Texture reference

Returns

CUD_A_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *pdptr the base address bound to the texture reference hTexRef, or returns
CUDA_ERROR_INVALID_VALUE if the texture reference is not bound to any device memory range.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat
CUresult cuTexRefGetAddressMode (CUaddress_mode *pam, CUtexref hTexRef, int dim)

Gets the addressing mode used by a texture reference.

Parameters

pam
- Returned addressing mode

hTexRef
- Texture reference

dim
- Dimension

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *pam the addressing mode corresponding to the dimension dim of the texture reference hTexRef. Currently, the only valid value for dim are 0 and 1.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat,
cuTexRefGetAddress, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags,
cuTexRefGetFormat

CUresult cuTexRefGetArray (CUarray *phArray, CUtexref hTexRef)

Gets the array bound to a texture reference.

Parameters

phArray
- Returned array

hTexRef
- Texture reference
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *phArray the CUDA array bound to the texture reference hTexRef, or returns CUDA_ERROR_INVALID_VALUE if the texture reference is not bound to any CUDA array.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat

CUresult cuTexRefGetBorderColor (float *pBorderColor, CUtexref hTexRef)

Gets the border color used by a texture reference.

Parameters

pBorderColor
  - Returned Type and Value of RGBA color

hTexRef
  - Texture reference

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Deprecated

See also:

cuTexRefSetAddressMode, cuTexRefSetAddressMode, cuTexRefSetBorderColor

CUresult cuTexRefGetFilterMode (CUfilter_mode *pfm, CUtexref hTexRef)
Gets the filter-mode used by a texture reference.

Parameters

pfm
- Returned filtering mode
hTexRef
- Texture reference

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *pfm the filtering mode of the texture reference hTexRef.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat,
cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFlags,
cuTexRefGetFormat

CUresult cuTexRefGetFlags (unsigned int *pFlags, CUtexref hTexRef)
Gets the flags used by a texture reference.

Parameters

pFlags
- Returned flags
hTexRef
- Texture reference
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *pFlags the flags of the texture reference hTexRef.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat,
cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray,
cuTexRefGetFilterMode, cuTexRefGetFormat

CUresult cuTexRefGetFormat (CUarray_format *pFormat, int *pNumChannels, CUtexref hTexRef)

Gets the format used by a texture reference.

Parameters

pFormat
  - Returned format
pNumChannels
  - Returned number of components
hTexRef
  - Texture reference

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *pFormat and *pNumChannels the format and number of components
of the CUDA array bound to the texture reference hTexRef. If pFormat or
pNumChannels is NULL, it will be ignored.

See also:
cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags

CUresult cuTexRefGetMaxAnisotropy (int *pmaxAniso, CUtexref hTexRef)

Gets the maximum anisotropy for a texture reference.

**Parameters**

pmaxAniso
- Returned maximum anisotropy

hTexRef
- Texture reference

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

**Description**

Deprecated

Returns the maximum anisotropy in pmaxAniso that's used when reading memory through the texture reference hTexRef.

**See also:**

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags

CUresult cuTexRefGetMipmapFilterMode (CUfilter_mode *pfm, CUtexref hTexRef)

Gets the mipmap filtering mode for a texture reference.

**Parameters**

pfm
- Returned mipmap filtering mode
hTexRef
- Texture reference

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Returns the mipmap filtering mode in \texttt{pfm} that's used when reading memory through the texture reference \texttt{hTexRef}.

See also:
cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat

\textbf{CUresult cuTexRefGetMipmapLevelBias (float *pbias, CUtxref hTexRef)}
Gets the mipmap level bias for a texture reference.

Parameters
pbias
- Returned mipmap level bias
hTexRef
- Texture reference

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Returns the mipmap level bias in \texttt{pBias} that's added to the specified mipmap level when reading memory through the texture reference \texttt{hTexRef}.
See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat

CUresult cuTexRefGetMipmapLevelClamp
(float *pminMipmapLevelClamp, float *
*pmaxMipmapLevelClamp, CUtexref hTexRef)

Gets the min/max mipmap level clamps for a texture reference.

Parameters

pminMipmapLevelClamp
- Returned mipmap min level clamp
pmaxMipmapLevelClamp
- Returned mipmap max level clamp
hTexRef
- Texture reference

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns the min/max mipmap level clamps in pminMipmapLevelClamp and pmaxMipmapLevelClamp that's used when reading memory through the texture reference hTexRef.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat
CUresult cuTexRefGetMipmappedArray
(CUmipmappedArray *phMipmappedArray, CUtexref hTexRef)

Gets the mipmapped array bound to a texture reference.

Parameters

phMipmappedArray
- Returned mipmapped array
hTexRef
- Texture reference

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Returns in *phMipmappedArray the CUDA mipmapped array bound to the texture reference hTexRef, or returns CUDA_ERROR_INVALID_VALUE if the texture reference is not bound to any CUDA mipmapped array.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat,
cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat

CUresult cuTexRefSetAddress (size_t *ByteOffset,
CUtexref hTexRef, CUdeviceptr dptr, size_t bytes)

Binds an address as a texture reference.

Parameters

ByteOffset
- Returned byte offset
hTexRef
- Texture reference to bind
dpdr
- Device pointer to bind

bytes
- Size of memory to bind in bytes

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description
Deprecated

Binds a linear address range to the texture reference hTexRef. Any previous address or CUDA array state associated with the texture reference is superseded by this function. Any memory previously bound to hTexRef is unbound.

Since the hardware enforces an alignment requirement on texture base addresses, cuTexRefSetAddress() passes back a byte offset in *ByteOffset that must be applied to texture fetches in order to read from the desired memory. This offset must be divided by the texel size and passed to kernels that read from the texture so they can be applied to the tex1Dfetch() function.

If the device memory pointer was returned from cuMemAlloc(), the offset is guaranteed to be 0 and NULL may be passed as the ByteOffset parameter.

The total number of elements (or texels) in the linear address range cannot exceed CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LINEAR_WIDTH. The number of elements is computed as (bytes / bytesPerElement), where bytesPerElement is determined from the data format and number of components set using cuTexRefSetFormat().

See also:
cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTexture
CUresult cuTexRefSetAddress2D (CUtexref hTexRef, const CUDA_ARRAY_DESCRIPTOR *desc, CUdeviceptr dptr, size_t Pitch)

Binds an address as a 2D texture reference.

Parameters

hTexRef
- Texture reference to bind

desc
- Descriptor of CUDA array

dptr
- Device pointer to bind

Pitch
- Line pitch in bytes

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Binds a linear address range to the texture reference hTexRef. Any previous address or CUDA array state associated with the texture reference is superseded by this function. Any memory previously bound to hTexRef is unbound.

Using a tex2D() function inside a kernel requires a call to either cuTexRefSetArray() to bind the corresponding texture reference to an array, or cuTexRefSetAddress2D() to bind the texture reference to linear memory.

Function calls to cuTexRefSetFormat() cannot follow calls to cuTexRefSetAddress2D() for the same texture reference.

It is required that dptr be aligned to the appropriate hardware-specific texture alignment. You can query this value using the device attribute CU_DEVICE_ATTRIBUTE_TEXTURE_ALIGNMENT. If an unaligned dptr is supplied, CUDA_ERROR_INVALID_VALUE is returned.

Pitch has to be aligned to the hardware-specific texture pitch alignment. This value can be queried using the device attribute CU_DEVICE_ATTRIBUTE_TEXTURE_PITCH_ALIGNMENT. If an unaligned Pitch is supplied, CUDA_ERROR_INVALID_VALUE is returned.
Width and Height, which are specified in elements (or texels), cannot exceed `CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_WIDTH` and `CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_HEIGHT` respectively. Pitch, which is specified in bytes, cannot exceed `CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_PITCH`.

See also:
`cuTexRefSetAddress, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTexture2D`

CUresult cuTexRefSetAddressMode (CUtexref hTexRef, int dim, CUaddress_mode am)
Sets the addressing mode for a texture reference.

Parameters

- **hTexRef**
  - Texture reference
- **dim**
  - Dimension
- **am**
  - Addressing mode to set

Returns

- `CUDA_SUCCESS`
- `CUDA_ERROR_DEINITIALIZED`
- `CUDA_ERROR_NOT_INITIALIZED`
- `CUDA_ERROR_INVALID_CONTEXT`
- `CUDA_ERROR_INVALID_VALUE`

Description

Deprecated

Specifies the addressing mode `am` for the given dimension `dim` of the texture reference `hTexRef`. If `dim` is zero, the addressing mode is applied to the first parameter of the functions used to fetch from the texture; if `dim` is 1, the second, and so on.

CUaddress_mode is defined as:

```c
typedef enum CUaddress_mode_enum {
    CU_TR_ADDRESS_MODE_WRAP = 0,
    CU_TR_ADDRESS_MODE_CLAMP = 1,
    CU_TR_ADDRESS_MODE_MIRROR = 2,
    CU_TR_ADDRESS_MODE_BORDER = 3
} CUaddress_mode;
```
Note that this call has no effect if hTexRef is bound to linear memory. Also, if the flag, 
CU_TRSF_NORMALIZED_COORDINATES, is not set, the only supported address mode is 
CU_TR_ADDRESS_MODE_CLAMP.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetArray,
cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTexture, cudaBindTexture2D,
cudaBindTextureToArray, cudaBindTextureToMipmappedArray

CUresult cuTexRefSetArray (CUtexref hTexRef, CUarray hArray, unsigned int Flags)
Binds an array as a texture reference.

Parameters

hTexRef
- Texture reference to bind
hArray
- Array to bind
Flags
- Options (must be CU_TRSA_OVERRIDE_FORMAT)

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Binds the CUDA array hArray to the texture reference hTexRef. Any previous address or CUDA array state associated with the texture reference is superseded by this function. Flags must be set to CU_TRSA_OVERRIDE_FORMAT. Any CUDA array previously bound to hTexRef is unbound.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress,
CUresult cuTexRefSetBorderColor (CUtexref hTexRef, float *pBorderColor)
Sets the border color for a texture reference.

Parameters

hTexRef
- Texture reference

pBorderColor
- RGBA color

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Specifies the value of the RGBA color via the pBorderColor to the texture reference hTexRef. The color value supports only float type and holds color components in the following sequence: pBorderColor[0] holds 'R' component pBorderColor[1] holds 'G' component pBorderColor[2] holds 'B' component pBorderColor[3] holds 'A' component

Note that the color values can be set only when the Address mode is set to CU_TR_ADDRESS_MODE_BORDER using cuTexRefSetAddressMode. Applications using integer border color values have to "reinterpret_cast" their values to float.

See also:

cuTexRefSetAddressMode, cuTexRefGetAddressMode, cuTexRefGetBorderColor,
cudaBindTexture, cudaBindTexture2D, cudaBindTextureToArray,
cudaBindTextureToMipmappedArray
CUresult cuTexRefSetFilterMode (CUtexref hTexRef, CUfilter_mode fm)
Sets the filtering mode for a texture reference.

Parameters

hTexRef  
- Texture reference
fm  
- Filtering mode to set

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Specifies the filtering mode \( fm \) to be used when reading memory through the texture reference \( hTexRef \). CUfilter_mode_enum is defined as:

```c
typedef enum CUfilter_mode_enum {
    CU_TR_FILTER_MODE_POINT = 0,
    CU_TR_FILTER_MODE_LINEAR = 1
} CUfilter_mode;
```

Note that this call has no effect if \( hTexRef \) is bound to linear memory.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTextureToArray

CUresult cuTexRefSetFlags (CUtexref hTexRef, unsigned int Flags)
Sets the flags for a texture reference.

Parameters

hTexRef  
- Texture reference
Flags
- Optional flags to set

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Specifies optional flags via Flags to specify the behavior of data returned through the
texture reference hTexRef. The valid flags are:

- CU_TRSF_READ_AS_INTEGER, which suppresses the default behavior of having
  the texture promote integer data to floating point data in the range [0, 1]. Note that
  texture with 32-bit integer format would not be promoted, regardless of whether or
  not this flag is specified;
- CU_TRSF_NORMALIZED_COORDINATES, which suppresses the default behavior
  of having the texture coordinates range from [0, Dim) where Dim is the width or
  height of the CUDA array. Instead, the texture coordinates [0, 1.0) reference the
  entire breadth of the array dimension;

See also:
cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFormat, cuTexRefGetAddress,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTexture, cudaBindTexture2D,
cudaBindTextureToArray, cudaBindTextureToMipmappedArray

CUresult cuTexRefSetFormat (CUtexref hTexRef,
CUarray_format fmt, int NumPackedComponents)
Sets the format for a texture reference.

Parameters

hTexRef
- Texture reference
fmt
- Format to set
NumPackedComponents
- Number of components per array element
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Specifies the format of the data to be read by the texture reference hTexRef. fmt and NumPackedComponents are exactly analogous to the Format and NumChannels members of the CUDA_ARRAY_DESCRIPTOR structure: They specify the format of each component and the number of components per array element.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefGetAddress,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat, cudaCreateChannelDesc, cudaBindTexture,
cudaBindTexture2D, cudaBindTextureToArray, cudaBindTextureToMipmappedArray

CUresult cuTexRefSetMaxAnisotropy (CUtexref hTexRef,
unsigned int maxAniso)

Sets the maximum anisotropy for a texture reference.

Parameters

hTexRef
  - Texture reference
maxAniso
  - Maximum anisotropy

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated

Specifies the maximum anisotropy maxAniso to be used when reading memory through the texture reference hTexRef.
Note that this call has no effect if \texttt{hTexRef} is bound to linear memory.

See also:

\texttt{cuTexRefSetAddress}, \texttt{cuTexRefSetAddress2D}, \texttt{cuTexRefSetAddressMode}, \texttt{cuTexRefSetArray}, \texttt{cuTexRefSetFlags}, \texttt{cuTexRefSetFormat}, \texttt{cuTexRefGetAddress}, \texttt{cuTexRefGetAddressMode}, \texttt{cuTexRefGetArray}, \texttt{cuTexRefGetFilterMode}, \texttt{cuTexRefGetFlags}, \texttt{cuTexRefGetFormat}, \texttt{cudaBindTextureToArray}, \texttt{cudaBindTextureToMipmappedArray}

\textbf{CUresult cuTexRefSetMipmapFilterMode (CUtexref hTexRef, CUfilter\_mode fm)}

Sets the mipmap filtering mode for a texture reference.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{hTexRef} - Texture reference
  \item \texttt{fm} - Filtering mode to set
\end{itemize}

\textbf{Returns}

\begin{itemize}
  \item CUDA\_SUCCESS, CUDA\_ERROR\_DEINITIALIZED,
  \item CUDA\_ERROR\_NOT\_INITIALIZED, CUDA\_ERROR\_INVALID\_CONTEXT,
  \item CUDA\_ERROR\_INVALID\_VALUE
\end{itemize}

\textbf{Description}

\textbf{Deprecated}

Specifies the mipmap filtering mode \texttt{fm} to be used when reading memory through the texture reference \texttt{hTexRef}. \texttt{CUfilter\_mode\_enum} is defined as:

```c
typedef enum CUfilter_mode_enum {
    CU_TR_FILTER_MODE_POINT = 0,
    CU_TR_FILTER_MODE_LINEAR = 1
} CUfilter_mode;
```

Note that this call has no effect if \texttt{hTexRef} is not bound to a mipmapped array.

See also:

\texttt{cuTexRefSetAddress}, \texttt{cuTexRefSetAddress2D}, \texttt{cuTexRefSetAddressMode}, \texttt{cuTexRefSetArray}, \texttt{cuTexRefSetFlags}, \texttt{cuTexRefSetFormat}, \texttt{cuTexRefGetAddress}, \texttt{cuTexRefGetAddressMode}, \texttt{cuTexRefGetArray}, \texttt{cuTexRefGetFilterMode}, \texttt{cuTexRefGetFlags}, \texttt{cuTexRefGetFormat}, \texttt{cudaBindTextureToArray}, \texttt{cudaBindTextureToMipmappedArray}
CUresult cuTexRefSetMipmapLevelBias (CUtexref hTexRef, float bias)
Sets the mipmap level bias for a texture reference.

Parameters

hTexRef
- Texture reference
bias
- Mipmap level bias

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Deprecated
Specifies the mipmap level bias bias to be added to the specified mipmap level when reading memory through the texture reference hTexRef.

Note that this call has no effect if hTexRef is not bound to a mipmapped array.

See also:
cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTextureToMipmappedArray

CUresult cuTexRefSetMipmapLevelClamp (CUtexref hTexRef, float minMipmapLevelClamp, float maxMipmapLevelClamp)
Sets the mipmap min/max mipmap level clamps for a texture reference.

Parameters

hTexRef
- Texture reference
minMipmapLevelClamp
- Mipmap min level clamp
maxMipmapLevelClamp
- Mipmap max level clamp
maxMipmapLevelClamp
- Mipmap max level clamp

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Specifies the min/max mipmap level clamps, minMipmapLevelClamp and
maxMipmapLevelClamp respectively, to be used when reading memory through the
texture reference hTexRef.

Note that this call has no effect if hTexRef is not bound to a mipmapped array.

See also:
cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode,
cuTexRefSetArray, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress,
cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode,
cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTextureToMipmappedArray

CUresult cuTexRefSetMipmappedArray (CUtexref
hTexRef, CUmipmappedArray hMipmappedArray,
unsigned int Flags)
Binds a mipmapped array to a texture reference.

Parameters
hTexRef
- Texture reference to bind
hMipmappedArray
- Mipmapped array to bind
Flags
- Options (must be CU_TRSA_OVERRIDE_FORMAT)

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE
Description

Deprecated

Binds the CUDA mipmapped array `hMipmappedArray` to the texture reference `hTexRef`. Any previous address or CUDA array state associated with the texture reference is superseded by this function. **Flags** must be set to `CU_TRSA_OVERRIDE_FORMAT`. Any CUDA array previously bound to `hTexRef` is unbound.

See also:

cuTexRefSetAddress, cuTexRefSetAddress2D, cuTexRefSetAddressMode, cuTexRefSetFilterMode, cuTexRefSetFlags, cuTexRefSetFormat, cuTexRefGetAddress, cuTexRefGetAddressMode, cuTexRefGetArray, cuTexRefGetFilterMode, cuTexRefGetFlags, cuTexRefGetFormat, cudaBindTextureToMipmappedArray

5.22. Surface Reference Management

[DEPRECATED]

This section describes the surface reference management functions of the low-level CUDA driver application programming interface.

`CUresult cuSurfRefGetArray (CUarray *phArray, CUsurfref hSurfRef)`

Passes back the CUDA array bound to a surface reference.

Parameters

`phArray`
- Surface reference handle

`hSurfRef`
- Surface reference handle

Returns

`CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE`

Description

Deprecated
Returns in *phArray the CUDA array bound to the surface reference hSurfRef, or returns CUDA_ERROR_INVALID_VALUE if the surface reference is not bound to any CUDA array.

See also:
cuModuleGetSurfRef, cuSurfRefSetArray

CUresult cuSurfRefSetArray (CUsurfref hSurfRef, CUarray hArray, unsigned int Flags)
Sets the CUDA array for a surface reference.

Parameters
hSurfRef  
- Surface reference handle
hArray  
- CUDA array handle
Flags  
- set to 0

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description
Deprecated
Sets the CUDA array hArray to be read and written by the surface reference hSurfRef. Any previous CUDA array state associated with the surface reference is superseded by this function. Flags must be set to 0. The CUDA_ARRAY3D_SURFACE_LDST flag must have been set for the CUDA array. Any CUDA array previously bound to hSurfRef is unbound.

See also:
cuModuleGetSurfRef, cuSurfRefGetArray, cudaBindSurfaceToArray
5.23. Texture Object Management

This section describes the texture object management functions of the low-level CUDA driver application programming interface. The texture object API is only supported on devices of compute capability 3.0 or higher.

CUresult cuTexObjectCreate (CUtexObject *pTexObject, const CUDA_RESOURCE_DESC *pResDesc, const CUDA_TEXTURE_DESC *pTexDesc, const CUDA_RESOURCE_VIEW_DESC *pResViewDesc)

Creates a texture object.

Parameters

pTexObject
- Texture object to create

pResDesc
- Resource descriptor

pTexDesc
- Texture descriptor

pResViewDesc
- Resource view descriptor

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description

Creates a texture object and returns it in pTexObject. pResDesc describes the data to texture from. pTexDesc describes how the data should be sampled. pResViewDesc is an optional argument that specifies an alternate format for the data described by pResDesc, and also describes the subresource region to restrict access to when texturing. pResViewDesc can only be specified if the type of resource is a CUDA array or a CUDA mipmapped array.

Texture objects are only supported on devices of compute capability 3.0 or higher. Additionally, a texture object is an opaque value, and, as such, should only be accessed through CUDA API calls.
The **CUDA_RESOURCE_DESC** structure is defined as:

```c
typedef struct CUDA_RESOURCE_DESC_st {
    CUresourcetype resType;
    union {
        struct {
            CUarray hArray;
        } array;
        struct {
            CUmipmappedArray hMipmappedArray;
        } mipmap;
        struct {
            CUdeviceptr devPtr;
            CUarray_format format;
            unsigned int numChannels;
            size_t sizeInBytes;
        } linear;
        struct {
            CUdeviceptr devPtr;
            CUarray_format format;
            unsigned int numChannels;
            size_t width;
            size_t height;
            size_t pitchInBytes;
        } pitch2D;
    } res;
    unsigned int flags;
} CUDA_RESOURCE_DESC;
```

where:

- **CUDA_RESOURCE_DESC::resType** specifies the type of resource to texture from. **CUresourceType** is defined as:

```c
typedef enum CUresourcetype_enum {
    CU_RESOURCE_TYPE_ARRAY           = 0x00,
    CU_RESOURCE_TYPE_MIPMAPPED_ARRAY = 0x01,
    CU_RESOURCE_TYPE_LINEAR          = 0x02,
    CU_RESOURCE_TYPE_PITCH2D         = 0x03
} CUresourcetype;
```

If **CUDA_RESOURCE_DESC::resType** is set to **CU_RESOURCE_TYPE_ARRAY**, **CUDA_RESOURCE_DESC::res::array::hArray** must be set to a valid CUDA array handle.

If **CUDA_RESOURCE_DESC::resType** is set to **CU_RESOURCE_TYPE_MIPMAPPED_ARRAY**, **CUDA_RESOURCE_DESC::res::mipmap::hMipmappedArray** must be set to a valid CUDA mipmapped array handle.

If **CUDA_RESOURCE_DESC::resType** is set to **CU_RESOURCE_TYPE_LINEAR**, **CUDA_RESOURCE_DESC::res::linear::devPtr** must be set to a valid device pointer, that is aligned to **CU_DEVICE_ATTRIBUTE_TEXTURE_ALIGNMENT**.

**CUDA_RESOURCE_DESC::res::linear::format** and **CUDA_RESOURCE_DESC::res::linear::numChannels** describe the format of each component and the number of components per array element.
CUDA_RESOURCE_DESC::res::linear::sizeInBytes specifies the size of the array in bytes. The total number of elements in the linear address range cannot exceed 
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE1D_LINEAR_WIDTH. The number of elements is computed as (sizeInBytes / (sizeof(format) * numChannels)).

If CUDA_RESOURCE_DESC::resType is set to CU_RESOURCE_TYPE_PITCH2D, CUDA_RESOURCE_DESC::res::pitch2D::devPtr must be set to a valid device pointer, that is aligned to CU_DEVICE_ATTRIBUTE_TEXTURE_ALIGNMENT. CUDA_RESOURCE_DESC::res::pitch2D::format and CUDA_RESOURCE_DESC::res::pitch2D::numChannels describe the format of each component and the number of components per array element. CUDA_RESOURCE_DESC::res::pitch2D::width and CUDA_RESOURCE_DESC::res::pitch2D::height specify the width and height of the array in elements, and cannot exceed
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_WIDTH and 
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_HEIGHT respectively. CUDA_RESOURCE_DESC::res::pitch2D::pitchInBytes specifies the pitch between two rows in bytes and has to be aligned to
CU_DEVICE_ATTRIBUTE_TEXTURE_PITCH_ALIGNMENT. Pitch cannot exceed 
CU_DEVICE_ATTRIBUTE_MAXIMUM_TEXTURE2D_LINEAR_PITCH.

• flags must be set to zero.

The CUDA_TEXTURE_DESC struct is defined as

```
typedef struct CUDA_TEXTURE_DESC_st {
    CUaddress_mode addressMode[3];
    CUfilter_mode filterMode;
    unsigned int flags;
    unsigned int maxAnisotropy;
    CUfilter_mode mipmapFilterMode;
    float.mipmapLevelBias;
    float minMipmapLevelClamp;
    float maxMipmapLevelClamp;
} CUDA_TEXTURE_DESC;
```

where

• CUDA_TEXTURE_DESC::addressMode specifies the addressing mode for each dimension of the texture data. 

CUaddress_mode is defined as:

```
typedef enum CUaddress_mode_enum {
    CU_TR_ADDRESS_MODE_WRAP = 0,
    CU_TR_ADDRESS_MODE_CLAMP = 1,
    CU_TR_ADDRESS_MODE_MIRROR = 2,
    CU_TR_ADDRESS_MODE_BORDER = 3
} CUaddress_mode;
```

This is ignored if CUDA_RESOURCE_DESC::resType is 
CU_RESOURCE_TYPE_LINEAR. Also, if the flag, 
CU_TRSF_NORMALIZED_COORDINATES is not set, the only supported address mode is 
CU_TR_ADDRESS_MODE_CLAMP.
CUDA_TEXTURE_DESC::filterMode specifies the filtering mode to be used when fetching from the texture. CUfilter_mode is defined as:

```c
typedef enum CUfilter_mode_enum {
    CU_TR_FILTER_MODE_POINT = 0,
    CU_TR_FILTER_MODE_LINEAR = 1
} CUfilter_mode;
```

This is ignored if CUDA_RESOURCE_DESC::resType is CURESOURCE_TYPE_LINEAR.

CUDA_TEXTURE_DESC::flags can be any combination of the following:

- **CU_TRSF_READ_AS_INTEGER**, which suppresses the default behavior of having the texture promote integer data to floating point data in the range [0, 1]. Note that texture with 32-bit integer format would not be promoted, regardless of whether or not this flag is specified.
- **CU_TRSF_NORMALIZED_COORDINATES**, which suppresses the default behavior of having the texture coordinates range from [0, Dim) where Dim is the width or height of the CUDA array. Instead, the texture coordinates [0, 1.0) reference the entire breadth of the array dimension; Note that for CUDA mipmapmed arrays, this flag has to be set.

CUDA_TEXTURE_DESC::maxAnisotropy specifies the maximum anisotropy ratio to be used when doing anisotropic filtering. This value will be clamped to the range [1,16].

CUDA_TEXTURE_DESC::mipmapFilterMode specifies the filter mode when the calculated mipmap level lies between two defined mipmap levels.

CUDA_TEXTURE_DESC::mipmapLevelBias specifies the offset to be applied to the calculated mipmap level.

CUDA_TEXTURE_DESC::minMipmapLevelClamp specifies the lower end of the mipmap level range to clamp access to.

CUDA_TEXTURE_DESC::maxMipmapLevelClamp specifies the upper end of the mipmap level range to clamp access to.

The CUDA_RESOURCE_VIEW_DESC struct is defined as

```c
typedef struct CUDA_RESOURCE_VIEW_DESC_st {
    CUresourceViewFormat format;
    size_t width;
    size_t height;
    size_t depth;
    unsigned int firstMipmapLevel;
    unsigned int lastMipmapLevel;
    unsigned int firstLayer;
    unsigned int lastLayer;
} CUDA_RESOURCE_VIEW_DESC;
```

where:
CUDA_RESOURCE_VIEW_DESC::format specifies how the data contained in the CUDA array or CUDA mipmapped array should be interpreted. Note that this can incur a change in size of the texture data. If the resource view format is a block compressed format, then the underlying CUDA array or CUDA mipmapped array has to have a base of format CU_AD_FORMAT_UNSIGNED_INT32 with 2 or 4 channels, depending on the block compressed format. For ex., BC1 and BC4 require the underlying CUDA array to have a format of CU_AD_FORMAT_UNSIGNED_INT32 with 2 channels. The other BC formats require the underlying resource to have the same base format but with 4 channels.

CUDA_RESOURCE_VIEW_DESC::width specifies the new width of the texture data. If the resource view format is a block compressed format, this value has to be 4 times the original width of the resource. For non block compressed formats, this value has to be equal to that of the original resource.

CUDA_RESOURCE_VIEW_DESC::height specifies the new height of the texture data. If the resource view format is a block compressed format, this value has to be 4 times the original height of the resource. For non block compressed formats, this value has to be equal to that of the original resource.

CUDA_RESOURCE_VIEW_DESC::depth specifies the new depth of the texture data. This value has to be equal to that of the original resource.

CUDA_RESOURCE_VIEW_DESC::firstMipmapLevel specifies the most detailed mipmap level. This will be the new mipmap level zero. For non-mipmapped resources, this value has to be zero. CUDA_TEXTURE_DESC::minMipmapLevelClamp and CUDA_TEXTURE_DESC::maxMipmapLevelClamp will be relative to this value. For ex., if the firstMipmapLevel is set to 2, and a minMipmapLevelClamp of 1.2 is specified, then the actual minimum mipmap level clamp will be 3.2.

CUDA_RESOURCE_VIEW_DESC::lastMipmapLevel specifies the least detailed mipmap level. For non-mipmapped resources, this value has to be zero.

CUDA_RESOURCE_VIEW_DESC::firstLayer specifies the first layer index for layered textures. This will be the new layer zero. For non-layered resources, this value has to be zero.

CUDA_RESOURCE_VIEW_DESC::lastLayer specifies the last layer index for layered textures. For non-layered resources, this value has to be zero.

See also:
cuTexObjectDestroy, cudaCreateTextureObject
CUresult cuTexObjectDestroy (CUtexObject texObject)
Destroys a texture object.

Parameters

texObject
  - Texture object to destroy

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Destroys the texture object specified by texObject.

See also:

cuTexObjectCreate, cudaDestroyTextureObject

CUresult cuTexObjectGetResourceDesc
(CUDA_RESOURCE_DESC *pResDesc, CUtexObject texObject)
Returns a texture object's resource descriptor.

Parameters

pResDesc
  - Resource descriptor
texObject
  - Texture object

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Returns the resource descriptor for the texture object specified by texObject.
See also:
cuTexObjectCreate, cudaGetTextureObjectResourceDesc,

CUresult cuTexObjectGetResourceViewDesc
(CUDA_RESOURCE_VIEW_DESC *pResViewDesc,
CUtexObject texObject)
Returns a texture object's resource view descriptor.

Parameters
pResViewDesc
- Resource view descriptor
texObject
- Texture object

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Returns the resource view descriptor for the texture object specified by texObject. If no resource view was set for texObject, the CUDA_ERROR_INVALID_VALUE is returned.

See also:
cuTexObjectCreate, cudaGetTextureObjectResourceViewDesc

CUresult cuTexObjectGetTextureDesc
(CUDA_TEXTURE_DESC *pTexDesc, CUtexObject texObject)
Returns a texture object's texture descriptor.

Parameters
pTexDesc
- Texture descriptor
texObject
- Texture object
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Returns the texture descriptor for the texture object specified by texObject.

See also:
cuTexObjectCreate, cudaGetTextureObjectTextureDesc

5.24. Surface Object Management

This section describes the surface object management functions of the low-level CUDA
driver application programming interface. The surface object API is only supported on
devices of compute capability 3.0 or higher.

CUresult cuSurfObjectCreate (CUsurfObject
*pSurfObject, const CUDA_RESOURCE_DESC *pResDesc)
Creates a surface object.

Parameters
pSurfObject
- Surface object to create
pResDesc
- Resource descriptor

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Creates a surface object and returns it in pSurfObject. pResDesc describes the
data to perform surface load/stores on. CUDA_RESOURCE_DESC::resType must be
CU_RESOURCE_TYPE_ARRAY and CUDA_RESOURCE_DESC::res::array::hArray
must be set to a valid CUDA array handle. CUDA_RESOURCE_DESC::flags must be set
to zero.
Surface objects are only supported on devices of compute capability 3.0 or higher. Additionally, a surface object is an opaque value, and, as such, should only be accessed through CUDA API calls.

See also:
cuSurfObjectDestroy, cudaCreateSurfaceObject

CUresult cuSurfObjectDestroy (CUsurfObject surfObject)
Destroys a surface object.

Parameters
surfObject
  - Surface object to destroy

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Destroys the surface object specified by surfObject.

See also:
cuSurfObjectCreate, cudaDestroySurfaceObject

CUresult cuSurfObjectGetResourceDesc
(CUDA_RESOURCE_DESC *pResDesc, CUsurfObject surfObject)
Returns a surface object's resource descriptor.

Parameters
pResDesc
  - Resource descriptor
surfObject
  - Surface object
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE

Description
Returns the resource descriptor for the surface object specified by surfObject.

See also:
cuSurfObjectCreate, cudaGetSurfaceObjectResourceDesc

5.25. Peer Context Memory Access

This section describes the direct peer context memory access functions of the low-level CUDA driver application programming interface.

CUresult cuCtxDisablePeerAccess (CUcontext peerContext)
Disables direct access to memory allocations in a peer context and unregisters any registered allocations.

Parameters
peerContext
- Peer context to disable direct access to

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_PEER_ACCESS_NOT_ENABLED, CUDA_ERROR_INVALID_CONTEXT,

Description
Returns CUDA_ERROR_PEER_ACCESS_NOT_ENABLED if direct peer access has not yet been enabled from peerContext to the current context.

Returns CUDA_ERROR_INVALID_CONTEXT if there is no current context, or if peerContext is not a valid context.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuDeviceCanAccessPeer`, `cuCtxEnablePeerAccess`, `cudaDeviceDisablePeerAccess`

**CUresult cuCtxEnablePeerAccess (CUcontext peerContext, unsigned int Flags)**

Enables direct access to memory allocations in a peer context.

**Parameters**

- **peerContext**
  - Peer context to enable direct access to from the current context

- **Flags**
  - Reserved for future use and must be set to 0

**Returns**

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`,
`CUDA_ERROR_NOT_INITIALIZED`,
`CUDA_ERROR_PEER_ACCESS_ALREADY_ENABLED`,
`CUDA_ERROR_TOO_MANY_PEERS`, `CUDA_ERROR_INVALID_CONTEXT`,
`CUDA_ERROR_PEER_ACCESS_UNSUPPORTED`, `CUDA_ERROR_INVALID_VALUE`

**Description**

If both the current context and `peerContext` are on devices which support unified addressing (as may be queried using `CU_DEVICE_ATTRIBUTE_UNIFIED_ADDRESSING`) and same major compute capability, then on success all allocations from `peerContext` will immediately be accessible by the current context. See Unified Addressing for additional details.

Note that access granted by this call is unidirectional and that in order to access memory from the current context in `peerContext`, a separate symmetric call to `cuCtxEnablePeerAccess()` is required.

There is a system-wide maximum of eight peer connections per device.

Returns `CUDA_ERROR_PEER_ACCESS_UNSUPPORTED` if `cuDeviceCanAccessPeer()` indicates that the `CUdevice` of the current context cannot directly access memory from the `CUdevice` of `peerContext`. 
Returns `CUDA_ERROR_PEER_ACCESS_ALREADY_ENABLED` if direct access of `peerContext` from the current context has already been enabled.

Returns `CUDA_ERROR_TOO_MANY_PEERS` if direct peer access is not possible because hardware resources required for peer access have been exhausted.

Returns `CUDA_ERROR_INVALID_CONTEXT` if there is no current context, `peerContext` is not a valid context, or if the current context is `peerContext`.

Returns `CUDA_ERROR_INVALID_VALUE` if `Flags` is not 0.

---

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuDeviceCanAccessPeer`, `cuCtxDisablePeerAccess`, `cudaDeviceEnablePeerAccess`

**CUresult cuDeviceCanAccessPeer (int *canAccessPeer, CUdevice dev, CUdevice peerDev)**

Queries if a device may directly access a peer device’s memory.

**Parameters**

- `canAccessPeer` - Returned access capability
- `dev` - Device from which allocations on `peerDev` are to be directly accessed.
- `peerDev` - Device on which the allocations to be directly accessed by `dev` reside.

**Returns**

- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_DEVICE`

**Description**

Returns in `*canAccessPeer` a value of 1 if contexts on `dev` are capable of directly accessing memory from contexts on `peerDev` and 0 otherwise. If direct access of `peerDev` from `dev` is possible, then access may be enabled on two specific contexts by calling `cuCtxEnablePeerAccess()`. 
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxEnablePeerAccess, cuCtxDisablePeerAccess, cudaDeviceCanAccessPeer

CUresult cuDeviceGetP2PAttribute (int *value, CUdevice_P2PAttribute attrib, CUdevice srcDevice, CUdevice dstDevice)
Queries attributes of the link between two devices.

Parameters
value
- Returned value of the requested attribute
attrib
- The requested attribute of the link between srcDevice and dstDevice.
srcDevice
- The source device of the target link.
dstDevice
- The destination device of the target link.

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_DEVICE, CUDA_ERROR_INVALID_VALUE

Description
Returns in *value the value of the requested attribute attrib of the link between srcDevice and dstDevice. The supported attributes are:

- **CU_DEVICE_P2P_ATTRIBUTE_PERFORMANCE_RANK**: A relative value indicating the performance of the link between two devices.
- **CU_DEVICE_P2P_ATTRIBUTE_ACCESS_SUPPORTED**: 1 if P2P Access is enabled.
- **CU_DEVICE_P2P_ATTRIBUTE_NATIVE_ATOMIC_SUPPORTED**: 1 if Atomic operations over the link are supported.
- **CU_DEVICE_P2P_ATTRIBUTE_CUDA_ARRAY_ACCESS_SUPPORTED**: 1 if cudaArray can be accessed over the link.
Returns CUDA_ERROR_INVALID_DEVICE if srcDevice or dstDevice are not valid or if they represent the same device.

Returns CUDA_ERROR_INVALID_VALUE if attrib is not valid or if value is a null pointer.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxEnablePeerAccess, cuCtxDisablePeerAccess, cuDeviceCanAccessPeer, cudaDeviceGetP2PAttribute

5.26. Graphics Interoperability

This section describes the graphics interoperability functions of the low-level CUDA driver application programming interface.

CUresult cuGraphicsMapResources (unsigned int count, CUgraphicsResource *resources, CUstream hStream)
Map graphics resources for access by CUDA.

Parameters

count
- Number of resources to map
resources
- Resources to map for CUDA usage
hStream
- Stream with which to synchronize

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED, CUDA_ERROR_UNKNOWN

Description

Maps the count graphics resources in resources for access by CUDA.
The resources in resources may be accessed by CUDA until they are unmapped. The graphics API from which resources were registered should not access any resources while they are mapped by CUDA. If an application does so, the results are undefined.

This function provides the synchronization guarantee that any graphics calls issued before cuGraphicsMapResources() will complete before any subsequent CUDA work issued in stream begins.

If resources includes any duplicate entries then CUDA_ERROR_INVALID_HANDLE is returned. If any of resources are presently mapped for access by CUDA then CUDA_ERROR_ALREADY_MAPPED is returned.

- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult 
cuGraphicsResourceGetMappedMipmappedArray (CUmipmappedArray *pMipmappedArray, CUGraphicsResource resource)
Get a mipmapped array through which to access a mapped graphics resource.

Parameters
pMipmappedArray
- Returned mipmapped array through which resource may be accessed
resource
- Mapped resource to access

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED, CUDA_ERROR_NOT_MAPPED_AS_ARRAY
Description

Returns in *pMipmappedArray a mipmapped array through which the mapped graphics resource resource. The value set in *pMipmappedArray may change every time that resource is mapped.

If resource is not a texture then it cannot be accessed via a mipmapped array and CUDA_ERROR_NOT_MAPPED_AS_ARRAY is returned. If resource is not mapped then CUDA_ERROR_NOT_MAPPED is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuGraphicsResourceGetMappedPointer
(CUdeviceptr *pDevPtr, size_t *pSize, CUGraphicsResource resource)

Get a device pointer through which to access a mapped graphics resource.

Parameters

pDevPtr
- Returned pointer through which resource may be accessed

pSize
- Returned size of the buffer accessible starting at *pPointer

Description

Returns in *pDevPtr a pointer through which the mapped graphics resource resource may be accessed. Returns in pSize the size of the memory in bytes which
may be accessed from that pointer. The value set in `pPointer` may change every time that `resource` is mapped.

If `resource` is not a buffer then it cannot be accessed via a pointer and `CUDA_ERROR_NOT_MAPPED_AS_POINTER` is returned. If `resource` is not mapped then `CUDA_ERROR_NOT_MAPPED` is returned. *

Note that this function may also return error codes from previous, asynchronous launches.

See also:

**CUresult cuGraphicsResourceSetMapFlags**

**(CUgraphicsResource resource, unsigned int flags)**

Set usage flags for mapping a graphics resource.

**Parameters**

- `resource` - Registered resource to set flags for
- `flags` - Parameters for resource mapping

**Returns**

`CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED`

**Description**

Set flags for mapping the graphics resource `resource`.

Changes to `flags` will take effect the next time `resource` is mapped. The `flags` argument may be any of the following:

- **CU_GRAPHICS_MAP_RESOURCE_FLAGS_NONE**: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA kernels. This is the default value.
- **CU_GRAPHICS_MAP_RESOURCE_FLAGS_READONLY**: Specifies that CUDA kernels which access this resource will not write to this resource.
CU_GRAPHICS_MAP_RESOURCE_FLAGS_WRITEDISCARD: Specifies that CUDA kernels which access this resource will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.

If resource is presently mapped for access by CUDA then CUDA_ERROR_ALREADY_MAPPED is returned. If flags is not one of the above values then CUDA_ERROR_INVALID_VALUE is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsMapResources, cudaGraphicsResourceSetMapFlags

CUresult cuGraphicsSubResourceGetMappedArray (CUarray *pArray, CUgraphicsResource resource, unsigned int arrayIndex, unsigned int mipLevel)
Get an array through which to access a subresource of a mapped graphics resource.

Parameters
pArray
- Returned array through which a subresource of resource may be accessed
resource
- Mapped resource to access
arrayIndex
- Array index for array textures or cubemap face index as defined by CUarray_cubemap_face for cubemap textures for the subresource to access
mipLevel
- Mipmap level for the subresource to access

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_NOT_MAPPED, CUDA_ERROR_NOT_MAPPED_AS_ARRAY

Description
Returns in *pArray an array through which the subresource of the mapped graphics resource resource which corresponds to array index arrayIndex and mipmap level...
mipLevel may be accessed. The value set in *pArray may change every time that resource is mapped.

If resource is not a texture then it cannot be accessed via an array and CUDA_ERROR_NOT_MAPPED_AS_ARRAY is returned. If arrayIndex is not a valid array index for resource then CUDA_ERROR_INVALID_VALUE is returned. If mipLevel is not a valid mipmap level for resource then CUDA_ERROR_INVALID_VALUE is returned. If resource is not mapped then CUDA_ERROR_NOT_MAPPED is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

CUresult cuGraphicsUnmapResources (unsigned int count, CUgraphicsResource *resources, CUstream hStream)
Unmap graphics resources.

Parameters

count
- Number of resources to unmap
resources
- Resources to unmap
hStream
- Stream with which to synchronize

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED, CUDA_ERROR_UNKNOWN

Description

Unmaps the count graphics resources in resources.

Once unmapped, the resources in resources may not be accessed by CUDA until they are mapped again.
This function provides the synchronization guarantee that any CUDA work issued in stream before `cuGraphicsUnmapResources()` will complete before any subsequently issued graphics work begins.

If `resources` includes any duplicate entries then `CUDA_ERROR_INVALID_HANDLE` is returned. If any of `resources` are not presently mapped for access by CUDA then `CUDA_ERROR_NOT_MAPPED` is returned.

- This function uses standard default stream semantics.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuGraphicsMapResources`, `cudaGraphicsUnmapResources`

**CUresult cuGraphicsUnregisterResource**  
(CUgraphicsResource resource)

Unregisters a graphics resource for access by CUDA.

**Parameters**

- `resource` - Resource to unregister

**Returns**

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_HANDLE`, `CUDA_ERROR_UNKNOWN`

**Description**

Unregisters the graphics resource `resource` so it is not accessible by CUDA unless registered again.

If `resource` is invalid then `CUDA_ERROR_INVALID_HANDLE` is returned.

- Note that this function may also return error codes from previous, asynchronous launches.

See also:

5.27. Profiler Control

This section describes the profiler control functions of the low-level CUDA driver application programming interface.

CUresult cuProfilerInitialize (const char *configFile, const char *outputFile, CUoutput_mode outputMode)

Initialize the profiling.

Parameters

configFile
- Name of the config file that lists the counters/options for profiling.

outputFile
- Name of the outputFile where the profiling results will be stored.

outputMode
- outputMode, can be CU_OUT_KEY_VALUE_PAIR or CU_OUT_CSV.

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_PROFILER_DISABLED

Description

Using this API user can initialize the CUDA profiler by specifying the configuration file, output file and output file format. This API is generally used to profile different set of counters by looping the kernel launch. The configFile parameter can be used to select profiling options including profiler counters. Refer to the "Compute Command Line Profiler User Guide" for supported profiler options and counters.

Limitation: The CUDA profiler cannot be initialized with this API if another profiling tool is already active, as indicated by the CUDA_ERROR_PROFILER_DISABLED return code.

Typical usage of the profiling APIs is as follows:

for each set of counters/options { cuProfilerInitialize(); //Initialize profiling, set the counters or options in the config file ... cuProfilerStart(); // code to be profiled cuProfilerStop(); ... cuProfilerStart(); // code to be profiled cuProfilerStop(); ... }
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuProfilerStart, cuProfilerStop, cudaProfilerInitialize

CUresult cuProfilerStart (void)
Enable profiling.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_CONTEXT

Description
Enables profile collection by the active profiling tool for the current context. If profiling is already enabled, then cuProfilerStart() has no effect.

cuProfilerStart and cuProfilerStop APIs are used to programmatically control the profiling granularity by allowing profiling to be done only on selective pieces of code.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuProfilerInitialize, cuProfilerStop, cudaProfilerStart

CUresult cuProfilerStop (void)
Disable profiling.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_CONTEXT

Description
Disables profile collection by the active profiling tool for the current context. If profiling is already disabled, then cuProfilerStop() has no effect.

cuProfilerStart and cuProfilerStop APIs are used to programmatically control the profiling granularity by allowing profiling to be done only on selective pieces of code.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuProfilerInitialize, cuProfilerStart, cudaMemcpyProfile`

### 5.28. OpenGL Interoperability

This section describes the OpenGL interoperability functions of the low-level CUDA driver application programming interface. Note that mapping of OpenGL resources is performed with the graphics API agnostic, resource mapping interface described in Graphics Interoperability.

**OpenGL Interoperability [DEPRECATED]**

**enum CUGLDeviceList**

CUDA devices corresponding to an OpenGL device

**Values**

- `CU_GL_DEVICE_LIST_ALL = 0x01`
  - The CUDA devices for all GPUs used by the current OpenGL context
- `CU_GL_DEVICE_LIST_CURRENT_FRAME = 0x02`
  - The CUDA devices for the GPUs used by the current OpenGL context in its currently rendering frame
- `CU_GL_DEVICE_LIST_NEXT_FRAME = 0x03`
  - The CUDA devices for the GPUs to be used by the current OpenGL context in the next frame

**CResult cuGLGetDevices (unsigned int *pCudaDeviceCount, CUdevice *pCudaDevices, unsigned int cudaDeviceCount, CUGLDeviceList deviceList)**

Gets the CUDA devices associated with the current OpenGL context.

**Parameters**

- `pCudaDeviceCount`
  - Returned number of CUDA devices.
pCudaDevices
- Returned CUDA devices.

cudaDeviceCount
- The size of the output device array pCudaDevices.

deviceList
- The set of devices to return.

Returns
CUDA_SUCCESS, CUDA_ERROR_NO_DEVICE, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_GRAPHICS_CONTEXT

Description
Returns in *pCudaDeviceCount the number of CUDA-compatible devices corresponding to the current OpenGL context. Also returns in *pCudaDevices at most cudaDeviceCount of the CUDA-compatible devices corresponding to the current OpenGL context. If any of the GPUs being used by the current OpenGL context are not CUDA capable then the call will return CUDA_ERROR_NO_DEVICE.

The deviceList argument may be any of the following:

- **CU_GL_DEVICE_LIST_ALL**: Query all devices used by the current OpenGL context.
- **CU_GL_DEVICE_LIST_CURRENT_FRAME**: Query the devices used by the current OpenGL context to render the current frame (in SLI).
- **CU_GL_DEVICE_LIST_NEXT_FRAME**: Query the devices used by the current OpenGL context to render the next frame (in SLI). Note that this is a prediction, it can’t be guaranteed that this is correct in all cases.

This function is not supported on Mac OS X.
- Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuWGLGetDevice, cudaGLGetDevices
CUresult cuGraphicsGLRegisterBuffer
(CUgraphicsResource *pCudaResource, GLuint buffer, unsigned int Flags)
Registers an OpenGL buffer object.

Parameters

pCudaResource
- Pointer to the returned object handle
buffer
- name of buffer object to be registered
Flags
- Register flags

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_ALREADY_MAPPED, CUDA_ERROR_INVALID_CONTEXT,

Description

Registers the buffer object specified by buffer for access by CUDA. A handle to the
registered object is returned as pCudaResource. The register flags Flags specify the
intended usage, as follows:

- CU_GRAPHICS_REGISTER_FLAGS_NONE: Specifies no hints about how this
  resource will be used. It is therefore assumed that this resource will be read from
  and written to by CUDA. This is the default value.
- CU_GRAPHICS_REGISTER_FLAGS_READ_ONLY: Specifies that CUDA will not
  write to this resource.
- CU_GRAPHICS_REGISTER_FLAGS_WRITE_DISCARD: Specifies that CUDA will
  not read from this resource and will write over the entire contents of the resource, so
  none of the data previously stored in the resource will be preserved.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuGraphicsUnregisterResource, cuGraphicsMapResources,
cuGraphicsResourceGetMappedPointer, cudaGraphicsGLRegisterBuffer
CUresult cuGraphicsGLRegisterImage
(CUgraphicsResource *pCudaResource, GLuint image, GLenum target, unsigned int Flags)

Register an OpenGL texture or renderbuffer object.

Parameters

pCudaResource
- Pointer to the returned object handle

image
- name of texture or renderbuffer object to be registered

target
- Identifies the type of object specified by image

Flags
- Register flags

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_ALREADY_MAPPED, CUDA_ERROR_INVALID_CONTEXT,

Description

Registers the texture or renderbuffer object specified by image for access by CUDA. A handle to the registered object is returned as pCudaResource.

target must match the type of the object, and must be one of GL_TEXTURE_2D, GL_TEXTURE_RECTANGLE, GL_TEXTURE_CUBE_MAP, GL_TEXTURE_3D, GL_TEXTURE_2D_ARRAY, or GL_RENDERBUFFER.

The register flags Flags specify the intended usage, as follows:

 ▶ CU_GRAPHICS_REGISTER_FLAGS_NONE: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA. This is the default value.

 ▶ CU_GRAPHICS_REGISTER_FLAGS_READ_ONLY: Specifies that CUDA will not write to this resource.

 ▶ CU_GRAPHICS_REGISTER_FLAGS_WRITE_DISCARD: Specifies that CUDA will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.

 ▶ CU_GRAPHICS_REGISTER_FLAGS_SURFACE_LDST: Specifies that CUDA will bind this resource to a surface reference.

 ▶ CU_GRAPHICS_REGISTER_FLAGS_TEXTURE_GATHER: Specifies that CUDA will perform texture gather operations on this resource.
The following image formats are supported. For brevity’s sake, the list is abbreviated. For ex., \{GL_R, GL_RG\} X \{8, 16\} would expand to the following 4 formats \{GL_R8, GL_R16, GL_RG8, GL_RG16\}:

- GL_RED, GL_RG, GL_RGBA, GL_LUMINANCE, GL_ALPHA, GL_LUMINANCE_ALPHA, GL_INTENSITY
- \{GL_R, GL_RG, GL_RGBA\} X \{8, 16, 16F, 32F, 8UI, 16UI, 32UI, 8I, 16I, 32I\}
- \{GL_LUMINANCE, GL_ALPHA, GL_LUMINANCE_ALPHA, GL_INTENSITY\} X \{8, 16, 16F_ARB, 32F_ARB, 8UI_EXT, 16UI_EXT, 32UI_EXT, 8I_EXT, 16I_EXT, 32I_EXT\}

The following image classes are currently disallowed:

- Textures with borders
- Multisampled renderbuffers

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsUnregisterResource, cuGraphicsMapResources,
cuGraphicsSubResourceGetMappedArray, cudaGraphicsGLRegisterImage

\textbf{CUresult cuWGLGetDevice (CUdevice *pDevice, HGPUNV hGpu)}

Gets the CUDA device associated with hGpu.

**Parameters**

- \textbf{pDevice} - Device associated with hGpu
- \textbf{hGpu} - Handle to a GPU, as queried via WGL_NV_gpu_affinity()

**Returns**

\textbf{CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,}
\textbf{CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,}
\textbf{CUDA_ERROR_INVALID_VALUE}

**Description**

Returns in \*pDevice the CUDA device associated with a hGpu, if applicable.

cuGLMapBufferObject, cuGLRegisterBufferObject, cuGLUnmapBufferObject,
cuGLUnregisterBufferObject, cuGLUnmapBufferObjectAsync,
cuGLSetBufferObjectMapFlags, cudaWGLGetDevice

5.28.1. OpenGL Interoperability [DEPRECATED]

OpenGL Interoperability

This section describes deprecated OpenGL interoperability functionality.

enum CUGLmap_flags

Flags to map or unmap a resource

Values

CU_GL_MAP_RESOURCE_FLAGS_NONE = 0x00
CU_GL_MAP_RESOURCE_FLAGS_READ_ONLY = 0x01
CU_GL_MAP_RESOURCE_FLAGS_WRITE_DISCARD = 0x02

CUresult cuGLCtxCreate (CUcontext *pCtx, unsigned int Flags, CUdevice device)

Create a CUDA context for interoperability with OpenGL.

Parameters

pCtx
- Returned CUDA context

Flags
- Options for CUDA context creation

device
- Device on which to create the context

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY
Description

**Deprecated** This function is deprecated as of Cuda 5.0.

This function is deprecated and should no longer be used. It is no longer necessary to associate a CUDA context with an OpenGL context in order to achieve maximum interoperability performance.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuCtxCreate, cuGLInit, cuGLMapBufferObject, cuGLRegisterBufferObject, cuGLUnmapBufferObject, cuGLUnregisterBufferObject, cuGLMapBufferObjectAsync, cuGLUnmapBufferObjectAsync, cuGLSetBufferObjectMapFlags, cuWGLGetDevice`

**CResult cuGLInit (void)**

Initializes OpenGL interoperability.

Returns

`CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_UNKNOWN`

Description

**Deprecated** This function is deprecated as of Cuda 3.0.

Initializes OpenGL interoperability. This function is deprecated and calling it is no longer required. It may fail if the needed OpenGL driver facilities are not available.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuGLMapBufferObject, cuGLRegisterBufferObject, cuGLUnmapBufferObject, cuGLUnregisterBufferObject, cuGLMapBufferObjectAsync, cuGLUnmapBufferObjectAsync, cuGLSetBufferObjectMapFlags, cuWGLGetDevice`
CUresult cuGLMapBufferObject (CUdeviceptr *dptr, size_t *size, GLuint buffer)
Maps an OpenGL buffer object.

Parameters

dptr
- Returned mapped base pointer
size
- Returned size of mapping
buffer
- The name of the buffer object to map

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_MAP_FAILED

Description

Deprecated This function is deprecated as of Cuda 3.0.

Maps the buffer object specified by buffer into the address space of the current CUDA context and returns in *dptr and *size the base pointer and size of the resulting mapping.

There must be a valid OpenGL context bound to the current thread when this function is called. This must be the same context, or a member of the same shareGroup, as the context that was bound when the buffer was registered.

All streams in the current CUDA context are synchronized with the current GL context.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsMapResources
CUresult cuGLMapBufferObjectAsync (CUdeviceptr *dptr, size_t *size, GLuint buffer, CUstream hStream)
Maps an OpenGL buffer object.

Parameters

dptr
- Returned mapped base pointer
size
- Returned size of mapping
buffer
- The name of the buffer object to map
hStream
- Stream to synchronize

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_MAP_FAILED

Description

Deprecated This function is deprecated as of Cuda 3.0.
Maps the buffer object specified by buffer into the address space of the current CUDA context and returns in *dptr and *size the base pointer and size of the resulting mapping.

There must be a valid OpenGL context bound to the current thread when this function is called. This must be the same context, or a member of the same shareGroup, as the context that was bound when the buffer was registered.
Stream hStream in the current CUDA context is synchronized with the current GL context.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsMapResources
CUresult cuGLRegisterBufferObject (GLuint buffer)
Registers an OpenGL buffer object.

Parameters
buffer
- The name of the buffer object to register.

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_ALREADY_MAPPED

Description
Deprecated This function is deprecated as of Cuda 3.0.

Registers the buffer object specified by buffer for access by CUDA. This function must
be called before CUDA can map the buffer object. There must be a valid OpenGL context
bound to the current thread when this function is called, and the buffer name is resolved
by that context.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuGraphicsGLRegisterBuffer

CUresult cuGLSetBufferObjectMapFlags (GLuint buffer, unsigned int Flags)
Set the map flags for an OpenGL buffer object.

Parameters
buffer
- Buffer object to unmap
Flags
- Map flags
Returns

CUDA_SUCCESS, CUDA_ERROR_NOT_INITIALIZED,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED,
CUDA_ERROR_INVALID_CONTEXT,

Description

Deprecated This function is deprecated as of Cuda 3.0.

Sets the map flags for the buffer object specified by buffer.

Changes to Flags will take effect the next time buffer is mapped. The Flags argument may be any of the following:

- CU_GL_MAP_RESOURCE_FLAGS_NONE: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA kernels. This is the default value.
- CU_GL_MAP_RESOURCE_FLAGS_READ_ONLY: Specifies that CUDA kernels which access this resource will not write to this resource.
- CU_GL_MAP_RESOURCE_FLAGS_WRITE_DISCARD: Specifies that CUDA kernels which access this resource will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.

If buffer has not been registered for use with CUDA, then CUDA_ERROR_INVALID_HANDLE is returned. If buffer is presently mapped for access by CUDA, then CUDA_ERROR_ALREADY_MAPPED is returned.

There must be a valid OpenGL context bound to the current thread when this function is called. This must be the same context, or a member of the same shareGroup, as the context that was bound when the buffer was registered.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsResourceSetMapFlags

CUresult cuGLUnmapBufferObject (GLuint buffer)
Unmaps an OpenGL buffer object.

Parameters

buffer
- Buffer object to unmap
Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated This function is deprecated as of Cuda 3.0.
Unmaps the buffer object specified by buffer for access by CUDA.
There must be a valid OpenGL context bound to the current thread when this function is called. This must be the same context, or a member of the same shareGroup, as the context that was bound when the buffer was registered.
All streams in the current CUDA context are synchronized with the current GL context.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsUnmapResources

CUresult cuGLUnmapBufferObjectAsync (GLuint buffer, CUstream hStream)
Unmaps an OpenGL buffer object.

Parameters
buffer
- Name of the buffer object to unmap
hStream
- Stream to synchronize

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description
Deprecated This function is deprecated as of Cuda 3.0.
Unmaps the buffer object specified by buffer for access by CUDA.
There must be a valid OpenGL context bound to the current thread when this function is called. This must be the same context, or a member of the same shareGroup, as the context that was bound when the buffer was registered.

Stream `hStream` in the current CUDA context is synchronized with the current GL context.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuGraphicsUnmapResources`

**CUresult cuGLUnregisterBufferObject (GLuint buffer)**

Unregister an OpenGL buffer object.

**Parameters**

`buffer`
- Name of the buffer object to unregister

**Returns**

- `CUDA_SUCCESS`
- `CUDA_ERROR_DEINITIALIZED`
- `CUDA_ERROR_NOT_INITIALIZED`
- `CUDA_ERROR_INVALID_CONTEXT`
- `CUDA_ERROR_INVALID_VALUE`

**Description**

*Deprecated* This function is deprecated as of Cuda 3.0.

Unregisters the buffer object specified by `buffer`. This releases any resources associated with the registered buffer. After this call, the buffer may no longer be mapped for access by CUDA.

There must be a valid OpenGL context bound to the current thread when this function is called. This must be the same context, or a member of the same shareGroup, as the context that was bound when the buffer was registered.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
5.29. Direct3D 9 Interoperability

This section describes the Direct3D 9 interoperability functions of the low-level CUDA driver application programming interface. Note that mapping of Direct3D 9 resources is performed with the graphics API agnostic, resource mapping interface described in Graphics Interoperability.

Direct3D 9 Interoperability [DEPRECATED]

enum CUDADeviceList

CUDA devices corresponding to a D3D9 device

Values

CU_D3D9_DEVICE_LIST_ALL = 0x01
    The CUDA devices for all GPUs used by a D3D9 device
CU_D3D9_DEVICE_LIST_CURRENT_FRAME = 0x02
    The CUDA devices for the GPUs used by a D3D9 device in its currently rendering frame
CU_D3D9_DEVICE_LIST_NEXT_FRAME = 0x03
    The CUDA devices for the GPUs to be used by a D3D9 device in the next frame

CUresult cuD3D9CtxCreate (CUcontext *pCtx, CUdevice *pCudaDevice, unsigned int Flags, IDirect3DDevice9 *pD3DDevice)

Create a CUDA context for interoperability with Direct3D 9.

Parameters

pCtx
    - Returned newly created CUDA context
pCudaDevice
    - Returned pointer to the device on which the context was created
Flags
    - Context creation flags (see cuCtxCreate() for details)
pD3DDevice
    - Direct3D device to create interoperability context with

cuGraphicsUnregisterResource
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Creates a new CUDA context, enables interoperability for that context with the Direct3D
device `pD3DDevice`, and associates the created CUDA context with the calling thread.
The created `CUcontext` will be returned in `*pCtx`. Direct3D resources from this
device may be registered and mapped through the lifetime of this CUDA context. If
`pCudaDevice` is non-NULL then the `CUdevice` on which this CUDA context was
created will be returned in `*pCudaDevice`.

On success, this call will increase the internal reference count on `pD3DDevice`. This
reference count will be decremented upon destruction of this context through
cuCtxDestroy(). This context will cease to function if `pD3DDevice` is destroyed or
encounters an error.

Note that this function is never required for correct functionality. Use of this function
will result in accelerated interoperability only when the operating system is Windows
Vista or Windows 7, and the device `pD3DDevice` is not an `IDirect3DDevice9Ex`. In all
other circumstances, this function is not necessary.

---

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuD3D9GetDevice, cuGraphicsD3D9RegisterResource

CUresult cuD3D9CtxCreateOnDevice (CUcontext *pCtx,
unsigned int flags, IDirect3DDevice9 *pD3DDevice,
CUdevice cudaDevice)

Create a CUDA context for interoperability with Direct3D 9.

Parameters

pCtx
- Returned newly created CUDA context

flags
- Context creation flags (see cuCtxCreate() for details)
pD3DDevice
- Direct3D device to create interoperability context with

cudaDevice
- The CUDA device on which to create the context. This device must be among the
devices returned when querying CU_D3D9_DEVICES_ALL from cuD3D9GetDevices.

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description
Creates a new CUDA context, enables interoperability for that context with the Direct3D
device pD3DDevice, and associates the created CUDA context with the calling thread.
The created CUcontext will be returned in *pCtx. Direct3D resources from this device
may be registered and mapped through the lifetime of this CUDA context.

On success, this call will increase the internal reference count on pD3DDevice.
This reference count will be decremented upon destruction of this context through
cuCtxDestroy(). This context will cease to function if pD3DDevice is destroyed or
encounters an error.

Note that this function is never required for correct functionality. Use of this function
will result in accelerated interoperability only when the operating system is Windows
Vista or Windows 7, and the device pD3DDevice is not an IDirect3DDevice9Ex. In all
other circumstances, this function is not necessary.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuD3D9GetDevices, cuGraphicsD3D9RegisterResource

CUresult cuD3D9GetDevice (CUdevice *pCudaDevice,
const char *pszAdapterName)
Gets the CUDA device corresponding to a display adapter.

Parameters
pCudaDevice
- Returned CUDA device corresponding to pszAdapterName
pszAdapterName
- Adapter name to query for device

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_NOT_FOUND, CUDA_ERROR_UNKNOWN

Description
Returns in *pCudaDevice the CUDA-compatible device corresponding to
the adapter name pszAdapterName obtained from EnumDisplayDevices() or
IDirect3D9::GetAdapterIdentifier().
If no device on the adapter with name pszAdapterName is CUDA-compatible, then the
call will fail.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuD3D9CtxCreate, cudaD3D9GetDevice

CUresult cuD3D9GetDevices (unsigned int
*pCudaDeviceCount, CUdevice *pCudaDevices, unsigned
int cudaDeviceCount, IDirect3DDevice9 *pD3D9Device,
CUd3d9DeviceList deviceList)
Gets the CUDA devices corresponding to a Direct3D 9 device.

Parameters
pCudaDeviceCount
- Returned number of CUDA devices corresponding to pD3D9Device
pCudaDevices
- Returned CUDA devices corresponding to pD3D9Device
cudaDeviceCount
- The size of the output device array pCudaDevices
pD3D9Device
- Direct3D 9 device to query for CUDA devices
**deviceList**
- The set of devices to return. This set may be `CU_D3D9_DEVICE_LIST_ALL` for all devices, `CU_D3D9_DEVICE_LIST_CURRENT_FRAME` for the devices used to render the current frame (in SLI), or `CU_D3D9_DEVICE_LIST_NEXT_FRAME` for the devices used to render the next frame (in SLI).

**Returns**
- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_NO_DEVICE`, `CUDA_ERROR_INVALID_VALUE`, `CUDA_ERROR_NOT_FOUND`, `CUDA_ERROR_UNKNOWN`

**Description**
Returns in `*pCudaDeviceCount` the number of CUDA-compatible device corresponding to the Direct3D 9 device `pD3D9Device`. Also returns in `*pCudaDevices` at most `cudaDeviceCount` of the CUDA-compatible devices corresponding to the Direct3D 9 device `pD3D9Device`.

If any of the GPUs being used to render `pDevice` are not CUDA capable then the call will return `CUDA_ERROR_NO_DEVICE`.

> Note that this function may also return error codes from previous, asynchronous launches.

**See also:**
- `cuD3D9CtxCreate`, `cudaD3D9GetDevices`

**`CUresult cuD3D9GetDirect3DDevice (IDirect3DDevice9 **ppD3DDevice)`**
Get the Direct3D 9 device against which the current CUDA context was created.

**Parameters**
- `ppD3DDevice`
  - Returned Direct3D device corresponding to CUDA context

**Returns**
- `CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`
Description

Returns in *ppD3DDevice the Direct3D device against which this CUDA context was created in cuD3D9CtxCreate().

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuD3D9GetDevice, cudaD3D9GetDirect3DDevice

CUresult cuGraphicsD3D9RegisterResource
(CUgraphicsResource *pCudaResource, IDirect3DResource9 *pD3DResource, unsigned int Flags)

Register a Direct3D 9 resource for access by CUDA.

Parameters

pCudaResource
- Returned graphics resource handle
pD3DResource
- Direct3D resource to register
Flags
- Parameters for resource registration

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Registers the Direct3D 9 resource pD3DResource for access by CUDA and returns a CUDA handle to pD3DResource in pCudaResource. The handle returned in pCudaResource may be used to map and unmap this resource until it is unregistered. On success this call will increase the internal reference count on pD3DResource. This reference count will be decremented when this resource is unregistered through cuGraphicsUnregisterResource().

This call is potentially high-overhead and should not be called every frame in interactive applications.
The type of `pD3DResource` must be one of the following.

- IDirect3DVertexBuffer9: may be accessed through a device pointer
- IDirect3DIndexBuffer9: may be accessed through a device pointer
- IDirect3DSurface9: may be accessed through an array. Only stand-alone objects of type IDirect3DSurface9 may be explicitly shared. In particular, individual mipmap levels and faces of cube maps may not be registered directly. To access individual surfaces associated with a texture, one must register the base texture object.
- IDirect3DBaseTexture9: individual surfaces on this texture may be accessed through an array.

The `Flags` argument may be used to specify additional parameters at register time. The valid values for this parameter are

- `CU_GRAPHICS_REGISTER_FLAGS_NONE`: Specifies no hints about how this resource will be used.
- `CU_GRAPHICS_REGISTER_FLAGS_SURFACE_LDST`: Specifies that CUDA will bind this resource to a surface reference.
- `CU_GRAPHICS_REGISTER_FLAGS_TEXTURE_GATHER`: Specifies that CUDA will perform texture gather operations on this resource.

Not all Direct3D resources of the above types may be used for interoperability with CUDA. The following are some limitations.

- The primary rendertarget may not be registered with CUDA.
- Resources allocated as shared may not be registered with CUDA.
- Textures which are not of a format which is 1, 2, or 4 channels of 8, 16, or 32-bit integer or floating-point data cannot be shared.
- Surfaces of depth or stencil formats cannot be shared.

A complete list of supported formats is as follows:

- `D3DFMT_L8`
- `D3DFMT_L16`
- `D3DFMT_A8R8G8B8`
- `D3DFMT_X8R8G8B8`
- `D3DFMT_G16R16`
- `D3DFMT_A8B8G8R8`
- `D3DFMT_A8`
- `D3DFMT_A8L8`
- `D3DFMT_Q8W8V8U8`
- `D3DFMT_V16U16`
- `D3DFMT_A16B16G16R16F`
- `D3DFMT_A16B16G16R16`
- `D3DFMT_R32F`
- D3DFMT_G16R16F
- D3DFMT_A32B32G32R32F
- D3DFMT_G32R32F
- D3DFMT_R16F

If Direct3D interoperability is not initialized for this context using `cuD3D9CtxCreate` then `CUDA_ERROR_INVALID_CONTEXT` is returned. If `pD3DResource` is of incorrect type or is already registered then `CUDA_ERROR_INVALID_HANDLE` is returned. If `pD3DResource` cannot be registered then `CUDA_ERROR_UNKNOWN` is returned. If `Flags` is not one of the above specified value then `CUDA_ERROR_INVALID_VALUE` is returned.

Note that this function may also return error codes from previous, asynchronous launches.

5.29.1. Direct3D 9 Interoperability [DEPRECATED]

Direct3D 9 Interoperability

This section describes deprecated Direct3D 9 interoperability functionality.

```c
enum CUd3d9map_flags
{
    CU_D3D9_MAPRESOURCE_FLAGS_NONE = 0x00,
    CU_D3D9_MAPRESOURCE_FLAGS_READONLY = 0x01,
    CU_D3D9_MAPRESOURCE_FLAGS_WRITEDISCARD = 0x02,
}
```

```c
enum CUd3d9register_flags
{
    CU_D3D9_REGISTER_FLAGS_NONE = 0x00,
    CU_D3D9_REGISTER_FLAGS_ARRAY = 0x01,
}
```
CUresult cuD3D9MapResources (unsigned int count, IDirect3DResource9 **ppResource)
Map Direct3D resources for access by CUDA.

Parameters

count
- Number of resources in ppResource

ppResource
- Resources to map for CUDA usage

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED,
CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 3.0.
Maps the count Direct3D resources in ppResource for access by CUDA.
The resources in ppResource may be accessed in CUDA kernels until they are unmapped. Direct3D should not access any resources while they are mapped by CUDA. If an application does so the results are undefined.

This function provides the synchronization guarantee that any Direct3D calls issued before cuD3D9MapResources() will complete before any CUDA kernels issued after cuD3D9MapResources() begin.

If any of ppResource have not been registered for use with CUDA or if ppResource contains any duplicate entries, then CUDA_ERROR_INVALID_HANDLE is returned. If any of ppResource are presently mapped for access by CUDA, then CUDA_ERROR_ALREADY_MAPPED is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsMapResources
CUresult cuD3D9RegisterResource (IDirect3DResource9 *pResource, unsigned int Flags)
Register a Direct3D resource for access by CUDA.

Parameters
pResource
- Resource to register for CUDA access
Flags
- Flags for resource registration

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description
Deprecated This function is deprecated as of CUDA 3.0.

Registers the Direct3D resource pResource for access by CUDA.

If this call is successful, then the application will be able to map and unmap this resource until it is unregistered through cuD3D9UnregisterResource(). Also on success, this call will increase the internal reference count on pResource. This reference count will be decremented when this resource is unregistered through cuD3D9UnregisterResource().

This call is potentially high-overhead and should not be called every frame in interactive applications.

The type of pResource must be one of the following.

- IDirect3DVertexBuffer9: Cannot be used with Flags set to CU_D3D9_REGISTER_FLAGS_ARRAY.
- IDirect3DIndexBuffer9: Cannot be used with Flags set to CU_D3D9_REGISTER_FLAGS_ARRAY.
- IDirect3DSurface9: Only stand-alone objects of type IDirect3DSurface9 may be explicitly shared. In particular, individual mipmap levels and faces of cube maps may not be registered directly. To access individual surfaces associated with a texture, one must register the base texture object. For restrictions on the Flags parameter, see type IDirect3DBaseTexture9.
- IDirect3DBaseTexture9: When a texture is registered, all surfaces associated with the all mipmap levels of all faces of the texture will be accessible to CUDA.
The Flags argument specifies the mechanism through which CUDA will access the Direct3D resource. The following values are allowed.

- **CU_D3D9_REGISTER_FLAGS_NONE**: Specifies that CUDA will access this resource through a `CUdeviceptr`. The pointer, size, and (for textures), pitch for each subresource of this allocation may be queried through `cuD3D9ResourceGetMappedPointer()`, `cuD3D9ResourceGetMappedSize()`, and `cuD3D9ResourceGetMappedPitch()` respectively. This option is valid for all resource types.

- **CU_D3D9_REGISTER_FLAGS_ARRAY**: Specifies that CUDA will access this resource through a `CUarray` queried on a sub-resource basis through `cuD3D9ResourceGetMappedArray()`. This option is only valid for resources of type `IDirect3DSurface9` and subtypes of `IDirect3DBaseTexture9`.

Not all Direct3D resources of the above types may be used for interoperability with CUDA. The following are some limitations.

- The primary rendertarget may not be registered with CUDA.
- Resources allocated as shared may not be registered with CUDA.
- Any resources allocated in `D3POOL_SYSTEMMEM` or `D3POOL_MANAGED` may not be registered with CUDA.
- Textures which are not of a format which is 1, 2, or 4 channels of 8, 16, or 32-bit integer or floating-point data cannot be shared.
- Surfaces of depth or stencil formats cannot be shared.

If Direct3D interoperability is not initialized on this context, then `CUDA_ERROR_INVALID_CONTEXT` is returned. If `pResource` is of incorrect type (e.g, is a non-stand-alone `IDirect3DSurface9`) or is already registered, then `CUDA_ERROR_INVALID_HANDLE` is returned. If `pResource` cannot be registered then `CUDA_ERROR_UNKNOWN` is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuGraphicsD3D9RegisterResource`
CUresult cuD3D9ResourceGetMappedArray (CUarray *pArray, IDirect3DResource9 *pResource, unsigned int Face, unsigned int Level)

Get an array through which to access a subresource of a Direct3D resource which has been mapped for access by CUDA.

Parameters

pArray
- Returned array corresponding to subresource

pResource
- Mapped resource to access

Face
- Face of resource to access

Level
- Level of resource to access

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pArray an array through which the subresource of the mapped Direct3D resource pResource which corresponds to Face and Level may be accessed. The value set in pArray may change every time that pResource is mapped.

If pResource is not registered then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D9_REGISTER_FLAGS_ARRAY then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped then CUDA_ERROR_NOT_MAPPED is returned.

For usage requirements of Face and Level parameters, see cuD3D9ResourceGetMappedPointer().

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsSubResourceGetMappedArray

CUresult cuD3D9ResourceGetMappedPitch (size_t *pPitch, size_t *pPitchSlice, IDirect3DResource9 *pResource, unsigned int Face, unsigned int Level)

Get the pitch of a subresource of a Direct3D resource which has been mapped for access by CUDA.

Parameters

pPitch
- Returned pitch of subresource
pPitchSlice
- Returned Z-slice pitch of subresource
pResource
- Mapped resource to access
Face
- Face of resource to access
Level
- Level of resource to access

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pPitch and *pPitchSlice the pitch and Z-slice pitch of the subresource of the mapped Direct3D resource pResource, which corresponds to Face and Level. The values set in pPitch and pPitchSlice may change every time that pResource is mapped.

The pitch and Z-slice pitch values may be used to compute the location of a sample on a surface as follows.

For a 2D surface, the byte offset of the sample at position x, y from the base pointer of the surface is:

\( y \times \text{pitch} + (\text{bytes per pixel}) \times x \)

For a 3D surface, the byte offset of the sample at position x, y, z from the base pointer of the surface is:
\[ z^* \text{slicePitch} + y^* \text{pitch} + (\text{bytes per pixel})^* x \]

Both parameters \( pPitch \) and \( pPitchSlice \) are optional and may be set to NULL.

If \( pResource \) is not of type IDirect3DBaseTexture9 or one of its subtypes or if \( pResource \) has not been registered for use with CUDA, then \( \text{cudaErrorInvalidResourceHandle} \) is returned. If \( pResource \) was not registered with usage flags \( \text{CU}_\text{D3D9}_{\text{REGISTER}}_{\text{FLAGS}}_{\text{NONE}} \), then \( \text{CUDA}_\text{ERROR}_\text{INVALID}_\text{HANDLE} \) is returned. If \( pResource \) is not mapped for access by CUDA then \( \text{CUDA}_\text{ERROR}_\text{NOT}_\text{MAPPED} \) is returned.

For usage requirements of \( \text{Face} \) and \( \text{Level} \) parameters, see \( \text{cuD3D9ResourceGetMappedPointer()} \).

Note that this function may also return error codes from previous, asynchronous launches.

See also:

\( \text{cuGraphicsSubResourceGetMappedArray} \)

\( \text{CUresult cuD3D9ResourceGetMappedPointer (CUdeviceptr \(*pDevPtr,\)} \)
\( \text{IDirect3DResource9 \(*pResource, \text{unsigned int} \text{Face, unsigned int Level)\)} \)

Get the pointer through which to access a subresource of a Direct3D resource which has been mapped for access by CUDA.

**Parameters**

- **pDevPtr**
  - Returned pointer corresponding to subresource
- **pResource**
  - Mapped resource to access
- **Face**
  - Face of resource to access
- **Level**
  - Level of resource to access

**Returns**

- \( \text{CUDA}_\text{SUCCESS}, \text{CUDA}_\text{ERROR}_\text{DEINITIALIZED}, \)
- \( \text{CUDA}_\text{ERROR}_\text{NOT}_\text{INITIALIZED}, \text{CUDA}_\text{ERROR}_\text{INVALID}_\text{CONTEXT}, \)
- \( \text{CUDA}_\text{ERROR}_\text{INVALID}_\text{VALUE}, \text{CUDA}_\text{ERROR}_\text{INVALID}_\text{HANDLE}, \)
- \( \text{CUDA}_\text{ERROR}_\text{NOT}_\text{MAPPED} \)
**Description**

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pDevPtr the base pointer of the subresource of the mapped Direct3D resource pResource, which corresponds to Face and Level. The value set in pDevPtr may change every time that pResource is mapped.

If pResource is not registered, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D9_REGISTER_FLAGS_NONE, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped, then CUDA_ERROR_NOT_MAPPED is returned.

If pResource is of type IDirect3DCubeTexture9, then Face must one of the values enumerated by type D3DCUBEMAP_FACES. For all other types Face must be 0. If Face is invalid, then CUDA_ERROR_INVALID_VALUE is returned.

If pResource is of type IDirect3DBaseTexture9, then Level must correspond to a valid mipmap level. At present only mipmap level 0 is supported. For all other types Level must be 0. If Level is invalid, then CUDA_ERROR_INVALID_VALUE is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuGraphicsResourceGetMappedPointer`

**CResult cuD3D9ResourceGetMappedSize (size_t *pSize, IDirect3DResource9 *pResource, unsigned int Face, unsigned int Level)**

Get the size of a subresource of a Direct3D resource which has been mapped for access by CUDA.

**Parameters**

- **pSize**
  - Returned size of subresource
- **pResource**
  - Mapped resource to access
- **Face**
  - Face of resource to access
- **Level**
  - Level of resource to access
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pSize the size of the subresource of the mapped Direct3D resource pResource, which corresponds to Face and Level. The value set in pSize may change every time that pResource is mapped.

If pResource has not been registered for use with CUDA, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D9_REGISTER_FLAGS_NONE, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped for access by CUDA, then CUDA_ERROR_NOT_MAPPED is returned.

For usage requirements of Face and Level parameters, see cuD3D9ResourceGetMappedPointer.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsResourceGetMappedPointer

CUresult cuD3D9ResourceGetSurfaceDimensions (size_t *pWidth, size_t *pHeight, size_t *pDepth, IDirect3DResource9 *pResource, unsigned int Face, unsigned int Level)

Get the dimensions of a registered surface.

Parameters

pWidth
- Returned width of surface
pHeight
- Returned height of surface
pDepth
- Returned depth of surface
pResource
- Registered resource to access

Face
- Face of resource to access

Level
- Level of resource to access

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description
Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pWidth, *pHeight, and *pDepth the dimensions of the subresource of the
mapped Direct3D resource pResource, which corresponds to Face and Level.

Because anti-aliased surfaces may have multiple samples per pixel, it is possible that the
dimensions of a resource will be an integer factor larger than the dimensions reported by
the Direct3D runtime.

The parameters pWidth, pHeight, and pDepth are optional. For 2D surfaces, the value
returned in *pDepth will be 0.

If pResource is not of type IDirect3DBaseTexture9 or IDirect3DSurface9
or if pResource has not been registered for use with CUDA, then
CUDA_ERROR_INVALID_HANDLE is returned.

For usage requirements of Face and Level parameters, see
cuD3D9ResourceGetMappedPointer().

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuGraphicsSubResourceGetMappedArray
CUresult cuD3D9ResourceSetMapFlags (IDirect3DResource9 *pResource, unsigned int Flags)

Set usage flags for mapping a Direct3D resource.

Parameters

pResource
- Registered resource to set flags for

Flags
- Parameters for resource mapping

Returns

CU_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED

Description

Deprecated This function is deprecated as of Cuda 3.0.

Set Flags for mapping the Direct3D resource pResource.

Changes to Flags will take effect the next time pResource is mapped. The Flags argument may be any of the following:

- CU_D3D9_MAPRESOURCE_FLAGS_NONE: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA kernels. This is the default value.
- CU_D3D9_MAPRESOURCE_FLAGS_READONLY: Specifies that CUDA kernels which access this resource will not write to this resource.
- CU_D3D9_MAPRESOURCE_FLAGS_WRITEDISCARD: Specifies that CUDA kernels which access this resource will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.

If pResource has not been registered for use with CUDA, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is presently mapped for access by CUDA, then CUDA_ERROR_ALREADY_MAPPED is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsResourceSetMapFlags

CUresult cuD3D9UnmapResources (unsigned int count, IDirect3DResource9 **ppResource)

Unmaps Direct3D resources.

Parameters

count
- Number of resources to unmap for CUDA

ppResource
- Resources to unmap for CUDA

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED,
CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 3.0.

Unmaps the count Direct3D resources in ppResource.

This function provides the synchronization guarantee that any CUDA kernels issued before cuD3D9UnmapResources() will complete before any Direct3D calls issued after cuD3D9UnmapResources() begin.

If any of ppResource have not been registered for use with CUDA or if ppResource contains any duplicate entries, then CUDA_ERROR_INVALID_HANDLE is returned. If any of ppResource are not presently mapped for access by CUDA, then CUDA_ERROR_NOT_MAPPED is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsUnmapResources
CUresult cuD3D9UnregisterResource (IDirect3DResource9 *pResource)
Unregister a Direct3D resource.

Parameters

pResource
- Resource to unregister

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 3.0.

Unregisters the Direct3D resource pResource so it is not accessible by CUDA unless
registered again.

If pResource is not registered, then CUDA_ERROR_INVALID_HANDLE is returned.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuGraphicsUnregisterResource

5.30. Direct3D 10 Interoperability

This section describes the Direct3D 10 interoperability functions of the low-level CUDA
driver application programming interface. Note that mapping of Direct3D 10 resources
is performed with the graphics API agnostic, resource mapping interface described in
Graphics Interoperability.

Direct3D 10 Interoperability [DEPRECATED]

cuD3d10DeviceList

CUDA devices corresponding to a D3D10 device
Values

CU_D3D10_DEVICE_LIST_ALL = 0x01
   The CUDA devices for all GPUs used by a D3D10 device
CU_D3D10_DEVICE_LIST_CURRENT_FRAME = 0x02
   The CUDA devices for the GPUs used by a D3D10 device in its currently rendering frame
CU_D3D10_DEVICE_LIST_NEXT_FRAME = 0x03
   The CUDA devices for the GPUs to be used by a D3D10 device in the next frame

CUresult cuD3D10GetDevice (CUdevice *pCudaDevice, IDXGIAdapter *pAdapter)
Gets the CUDA device corresponding to a display adapter.

Parameters

pCudaDevice
   - Returned CUDA device corresponding to pAdapter
pAdapter
   - Adapter to query for CUDA device

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_NOT_FOUND, CUDA_ERROR_UNKNOWN

Description

Returns in *pCudaDevice the CUDA-compatible device corresponding to the adapter pAdapter obtained from IDXGIFactory::EnumAdapters.

If no device on pAdapter is CUDA-compatible then the call will fail.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuD3D10GetDevices, cudaD3D10GetDevice

CUresult cuD3D10GetDevices (unsigned int *pCudaDeviceCount, CUdevice *pCudaDevices, unsigned
int cudaDeviceCount, ID3D10Device *pD3D10Device, CUd3d10DeviceList deviceList)

Gets the CUDA devices corresponding to a Direct3D 10 device.

Parameters

pCudaDeviceCount  
- Returned number of CUDA devices corresponding to pD3D10Device

pCudaDevices  
- Returned CUDA devices corresponding to pD3D10Device

cudaDeviceCount  
- The size of the output device array pCudaDevices

pD3D10Device  
- Direct3D 10 device to query for CUDA devices

deviceList  
- The set of devices to return. This set may be CU_D3D10_DEVICE_LIST_ALL for all devices, CU_D3D10_DEVICE_LIST_CURRENT_FRAME for the devices used to render the current frame (in SLI), or CU_D3D10_DEVICE_LIST_NEXT_FRAME for the devices used to render the next frame (in SLI).

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,  
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_NO_DEVICE,  
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND,  
CUDA_ERROR_UNKNOWN

Description

Returns in *pCudaDeviceCount the number of CUDA-compatible device corresponding to the Direct3D 10 device pD3D10Device. Also returns in *pCudaDevices at most cudaDeviceCount of the CUDA-compatible devices corresponding to the Direct3D 10 device pD3D10Device.

If any of the GPUs being used to render pDevice are not CUDA capable then the call will return CUDA_ERROR_NO_DEVICE.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuD3D10GetDevice, cudaD3D10GetDevices
CUresult cuGraphicsD3D10RegisterResource
(CUgraphicsResource *pCudaResource, ID3D10Resource
*pD3DResource, unsigned int Flags)

Register a Direct3D 10 resource for access by CUDA.

Parameters

pCudaResource
- Returned graphics resource handle
pD3DResource
- Direct3D resource to register
Flags
- Parameters for resource registration

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Registers the Direct3D 10 resource pD3DResource for access by CUDA and returns a CUDA handle to pD3DResource in pCudaResource. The handle returned in pCudaResource may be used to map and unmap this resource until it is unregistered. On success this call will increase the internal reference count on pD3DResource. This reference count will be decremented when this resource is unregistered through cuGraphicsUnregisterResource().

This call is potentially high-overhead and should not be called every frame in interactive applications.

The type of pD3DResource must be one of the following.

- ID3D10Buffer: may be accessed through a device pointer.
- ID3D10Texture1D: individual subresources of the texture may be accessed via arrays
- ID3D10Texture2D: individual subresources of the texture may be accessed via arrays
- ID3D10Texture3D: individual subresources of the texture may be accessed via arrays

The Flags argument may be used to specify additional parameters at register time. The valid values for this parameter are

- CU_GRAPHICS_REGISTER_FLAGS_NONE: Specifies no hints about how this resource will be used.
CU_GRAPHICS_REGISTER_FLAGS_SURFACE_LDST: Specifies that CUDA will bind this resource to a surface reference.

CU_GRAPHICS_REGISTER_FLAGS_TEXTURE_GATHER: Specifies that CUDA will perform texture gather operations on this resource.

Not all Direct3D resources of the above types may be used for interoperability with CUDA. The following are some limitations.

- The primary rendertarget may not be registered with CUDA.
- Textures which are not of a format which is 1, 2, or 4 channels of 8, 16, or 32-bit integer or floating-point data cannot be shared.
- Surfaces of depth or stencil formats cannot be shared.

A complete list of supported DXGI formats is as follows. For compactness the notation A_{B,C,D} represents A_B, A_C, and A_D.

- DXGI_FORMAT_A8_UNORM
- DXGI_FORMAT_B8G8R8A8_UNORM
- DXGI_FORMAT_B8G8R8X8_UNORM
- DXGI_FORMAT_R16_FLOAT
- DXGI_FORMAT_R16G16B16A16\_FLOAT\_SINT\_SNORM\_UINT\_UNORM
- DXGI_FORMAT_R16G16\_FLOAT\_SINT\_SNORM\_UINT\_UNORM
- DXGI_FORMAT_R16\_SINT\_SNORM\_UINT\_UNORM
- DXGI_FORMAT_R32_FLOAT
- DXGI_FORMAT_R32G32B32A32\_FLOAT\_SINT\_UINT
- DXGI_FORMAT_R32G32\_FLOAT\_SINT\_UINT
- DXGI_FORMAT_R32\_SINT\_UINT
- DXGI_FORMAT_R8G8B8A8\_SINT\_SNORM\_UINT\_UNORM\_UNORM\_SRGB
- DXGI_FORMAT_R8G8\_SINT\_SNORM\_UINT\_UNORM
- DXGI_FORMAT_R8\_SINT\_SNORM\_UINT\_UNORM

If pD3DResource is of incorrect type or is already registered then CUDA_ERROR_INVALID_HANDLE is returned. If pD3DResource cannot be registered then CUDA_ERROR_UNKNOWN is returned. If Flags is not one of the above specified value then CUDA_ERROR_INVALID_VALUE is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
5.30.1. Direct3D 10 Interoperability [DEPRECATED]

Direct3D 10 Interoperability
This section describes deprecated Direct3D 10 interoperability functionality.

enum CUD3D10map_flags
Flags to map or unmap a resource

Values
- CU_D3D10_MAPRESOURCE_FLAGS_NONE = 0x00
- CU_D3D10_MAPRESOURCE_FLAGS_READONLY = 0x01
- CU_D3D10_MAPRESOURCE_FLAGS_WRITEDISCARD = 0x02

enum CUD3D10register_flags
Flags to register a resource

Values
- CU_D3D10_REGISTER_FLAGS_NONE = 0x00
- CU_D3D10_REGISTER_FLAGS_ARRAY = 0x01

CUresult cuD3D10CtxCreate (CUcontext *pCtx, CUdevice *pCudaDevice, unsigned int Flags, ID3D10Device *pD3DDevice)
Create a CUDA context for interoperability with Direct3D 10.

Parameters
- pCtx - Returned newly created CUDA context
- pCudaDevice - Returned pointer to the device on which the context was created
- Flags - Context creation flags (see cuCtxCreate() for details)
- pD3DDevice - Direct3D device to create interoperability context with
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 5.0.

This function is deprecated and should no longer be used. It is no longer necessary
to associate a CUDA context with a D3D10 device in order to achieve maximum
interoperability performance.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:

cuD3D10GetDevice, cuGraphicsD3D10RegisterResource

CUresult cuD3D10CtxCreateOnDevice (CUcontext *pCtx, unsigned int
flags, ID3D10Device *pD3DDevice, CUdevice cudaDevice)
Create a CUDA context for interoperability with Direct3D 10.

Parameters

pCtx
- Returned newly created CUDA context
flags
- Context creation flags (see cuCtxCreate() for details)
pD3DDevice
- Direct3D device to create interoperability context with
cudaDevice
- The CUDA device on which to create the context. This device must be
  among the devices returned when querying CU_D3D10_DEVICES_ALL from
cuD3D10GetDevices.

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN
**Description**

*Deprecated* This function is deprecated as of CUDA 5.0.

This function is deprecated and should no longer be used. It is no longer necessary to associate a CUDA context with a D3D10 device in order to achieve maximum interoperability performance.

See also:

`cuD3D10GetDevice`
CUresult cuD3D10MapResources (unsigned int count, ID3D10Resource** ppResources)
Map Direct3D resources for access by CUDA.

Parameters

count
- Number of resources to map for CUDA

ppResources
- Resources to map for CUDA

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED,
CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 3.0.

Maps the count Direct3D resources in ppResources for access by CUDA.

The resources in ppResources may be accessed in CUDA kernels until they are unmapped. Direct3D should not access any resources while they are mapped by CUDA. If an application does so, the results are undefined.

This function provides the synchronization guarantee that any Direct3D calls issued before cuD3D10MapResources() will complete before any CUDA kernels issued after cuD3D10MapResources() begin.

If any of ppResources have not been registered for use with CUDA or if ppResources contains any duplicate entries, then CUDA_ERROR_INVALID_HANDLE is returned. If any of ppResources are presently mapped for access by CUDA, then CUDA_ERROR_ALREADY_MAPPED is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsMapResources
CUresult cuD3D10RegisterResource (ID3D10Resource *pResource, unsigned int Flags)
Register a Direct3D resource for access by CUDA.

Parameters

pResource
- Resource to register

Flags
- Parameters for resource registration

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 3.0.

Registers the Direct3D resource pResource for access by CUDA.

If this call is successful, then the application will be able to map and unmap this resource until it is unregistered through cuD3D10UnregisterResource(). Also on success, this call will increase the internal reference count on pResource. This reference count will be decremented when this resource is unregistered through cuD3D10UnregisterResource().

This call is potentially high-overhead and should not be called every frame in interactive applications.

The type of pResource must be one of the following.

- ID3D10Buffer: Cannot be used with Flags set to CU_D3D10_REGISTER_FLAGS_ARRAY.
- ID3D10Texture1D: No restrictions.
- ID3D10Texture2D: No restrictions.
- ID3D10Texture3D: No restrictions.

The Flags argument specifies the mechanism through which CUDA will access the Direct3D resource. The following values are allowed.

- CU_D3D10_REGISTER_FLAGS_NONE: Specifies that CUDA will access this resource through a CUdeviceptr. The pointer, size, and (for textures), pitch for each subresource of this allocation may be queried through cuD3D10ResourceGetMappedPointer(), cuD3D10ResourceGetMappedSize(),
and cuD3D10ResourceGetMappedPitch() respectively. This option is valid for all resource types.

- **CU_D3D10_REGISTER_FLAGS_ARRAY**: Specifies that CUDA will access this resource through a CUarray queried on a sub-resource basis through cuD3D10ResourceGetMappedArray(). This option is only valid for resources of type ID3D10Texture1D, ID3D10Texture2D, and ID3D10Texture3D.

Not all Direct3D resources of the above types may be used for interoperability with CUDA. The following are some limitations.

- The primary render target may not be registered with CUDA.
- Resources allocated as shared may not be registered with CUDA.
- Textures which are not of a format which is 1, 2, or 4 channels of 8, 16, or 32-bit integer or floating-point data cannot be shared.
- Surfaces of depth or stencil formats cannot be shared.

If Direct3D interoperability is not initialized on this context then CUDA_ERROR_INVALID_CONTEXT is returned. If pResource is of incorrect type or is already registered, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource cannot be registered, then CUDA_ERROR_UNKNOWN is returned.

Note that this function may also return error codes from previous, asynchronous launches.

**See also:**

cuGraphicsD3D10RegisterResource

**CUresult cuD3D10ResourceGetMappedArray (CUarray *pArray, ID3D10Resource *pResource, unsigned int SubResource)**

Get an array through which to access a subresource of a Direct3D resource which has been mapped for access by CUDA.

**Parameters**

- **pArray**
  - Returned array corresponding to subresource
- **pResource**
  - Mapped resource to access
- **SubResource**
  - Subresource of pResource to access
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pArray an array through which the subresource of the mapped Direct3D resource pResource, which corresponds to SubResource may be accessed. The value set in pArray may change every time that pResource is mapped.

If pResource is not registered, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D10_REGISTER_FLAGS_ARRAY, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped, then CUDA_ERROR_NOT_MAPPED is returned.

For usage requirements of the SubResource parameter, see cuD3D10ResourceGetMappedPointer().

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsSubResourceGetMappedArray

CUresult cuD3D10ResourceGetMappedPitch (size_t *pPitch, size_t *pPitchSlice, ID3D10Resource *pResource, unsigned int SubResource)

Get the pitch of a subresource of a Direct3D resource which has been mapped for access by CUDA.

Parameters

pPitch
- Returned pitch of subresource

pPitchSlice
- Returned Z-slice pitch of subresource

pResource
- Mapped resource to access

SubResource
- Subresource of pResource to access
Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pPitch and *pPitchSlice the pitch and Z-slice pitch of the subresource of the mapped Direct3D resource pResource, which corresponds to SubResource.

The values set in pPitch and pPitchSlice may change every time that pResource is mapped.

The pitch and Z-slice pitch values may be used to compute the location of a sample on a surface as follows.

For a 2D surface, the byte offset of the sample at position x, y from the base pointer of the surface is:

\[ y \times \text{pitch} + (\text{bytes per pixel}) \times x \]

For a 3D surface, the byte offset of the sample at position x, y, z from the base pointer of the surface is:

\[ z \times \text{slicePitch} + y \times \text{pitch} + (\text{bytes per pixel}) \times x \]

Both parameters pPitch and pPitchSlice are optional and may be set to NULL.

If pResource is not of type IDirect3DBaseTexture10 or one of its subtypes or if pResource has not been registered for use with CUDA, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D10_REGISTER_FLAGS_NONE, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped for access by CUDA, then CUDA_ERROR_NOT_MAPPED is returned.

For usage requirements of the SubResource parameter, see cuD3D10ResourceGetMappedPointer().

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsSubResourceGetMappedArray
CUresult cuD3D10ResourceGetMappedPointer (CUdeviceptr *pDevPtr, ID3D10Resource *pResource, unsigned int SubResource)
Get a pointer through which to access a subresource of a Direct3D resource which has been mapped for access by CUDA.

Parameters

pDevPtr
- Returned pointer corresponding to subresource

pResource
- Mapped resource to access

SubResource
- Subresource of pResource to access

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pDevPtr the base pointer of the subresource of the mapped Direct3D resource pResource, which corresponds to SubResource. The value set in pDevPtr may change every time that pResource is mapped.

If pResource is not registered, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D10_REGISTER_FLAGS_NONE, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped, then CUDA_ERROR_NOT_MAPPED is returned.

If pResource is of type ID3D10Buffer, then SubResource must be 0. If pResource is of any other type, then the value of SubResource must come from the subresource calculation in D3D10CalcSubResource().

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsResourceGetMappedPointer
CUresult cuD3D10ResourceGetMappedSize (size_t *pSize, ID3D10Resource *pResource, unsigned int SubResource)

Get the size of a subresource of a Direct3D resource which has been mapped for access by CUDA.

Parameters

pSize
- Returned size of subresource

pResource
- Mapped resource to access

SubResource
- Subresource of pResource to access

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_NOT_MAPPED

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pSize the size of the subresource of the mapped Direct3D resource pResource, which corresponds to SubResource. The value set in pSize may change every time that pResource is mapped.

If pResource has not been registered for use with CUDA, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource was not registered with usage flags CU_D3D10_REGISTER_FLAGS_NONE, then CUDA_ERROR_INVALID_HANDLE is returned. If pResource is not mapped for access by CUDA, then CUDA_ERROR_NOT_MAPPED is returned.

For usage requirements of the SubResource parameter, see cuD3D10ResourceGetMappedPointer().

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuGraphicsResourceGetMappedPointer
CUresult cuD3D10ResourceGetSurfaceDimensions (size_t *pWidth, 
size_t *pHeight, size_t *pDepth, ID3D10Resource *pResource, 
unsigned int SubResource)
Get the dimensions of a registered surface.

Parameters

pWidth
- Returned width of surface
pHeight
- Returned height of surface
pDepth
- Returned depth of surface
pResource
- Registered resource to access
SubResource
- Subresource of pResource to access

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, 
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, 
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE

Description

Deprecated This function is deprecated as of CUDA 3.0.

Returns in *pWidth, *pHeight, and *pDepth the dimensions of the subresource of the 
mapped Direct3D resource pResource, which corresponds to SubResource.

Because anti-aliased surfaces may have multiple samples per pixel, it is possible that the 
dimensions of a resource will be an integer factor larger than the dimensions reported by 
the Direct3D runtime.

The parameters pWidth, pHeight, and pDepth are optional. For 2D surfaces, the value 
returned in *pDepth will be 0.

If pResource is not of type IDirect3DBaseTexture10 or IDirect3DSurface10 
or if pResource has not been registered for use with CUDA, then 
CUDA_ERROR_INVALID_HANDLE is returned.

For usage requirements of the SubResource parameter, see 
cuD3D10ResourceGetMappedPointer().
Note that this function may also return error codes from previous, asynchronous launches.

See also:

`cuGraphicsSubResourceGetMappedArray`

**CUresult cuD3D10ResourceSetMapFlags (ID3D10Resource *pResource, unsigned int Flags)**

Set usage flags for mapping a Direct3D resource.

**Parameters**

**pResource**

- Registered resource to set flags for

**Flags**

- Parameters for resource mapping

**Returns**

`CUDA_SUCCESS`, `CUDA_ERROR_DEINITIALIZED`, `CUDA_ERROR_NOT_INITIALIZED`, `CUDA_ERROR_INVALID_CONTEXT`, `CUDA_ERROR_INVALID_VALUE`, `CUDA_ERROR_INVALID_HANDLE`, `CUDA_ERROR_ALREADY_MAPPED`

**Description**

**Deprecated** This function is deprecated as of CUDA 3.0.

Set flags for mapping the Direct3D resource `pResource`.

Changes to flags will take effect the next time `pResource` is mapped. The `Flags` argument may be any of the following.

- **CU_D3D10_MAPRESOURCE_FLAGS_NONE**: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA kernels. This is the default value.
- **CU_D3D10_MAPRESOURCE_FLAGS_READONLY**: Specifies that CUDA kernels which access this resource will not write to this resource.
- **CU_D3D10_MAPRESOURCE_FLAGS_WRITEDISCARD**: Specifies that CUDA kernels which access this resource will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.
If \texttt{pResource} has not been registered for use with CUDA, then \texttt{CUDA_ERROR_INVALID_HANDLE} is returned. If \texttt{pResource} is presently mapped for access by CUDA then \texttt{CUDA_ERROR_ALREADY_MAPPED} is returned.

\begin{itemize}
    \item Note that this function may also return error codes from previous, asynchronous launches.
\end{itemize}

\textbf{See also:}

cuGraphicsResourceSetMapFlags

\textbf{CUresult cuD3D10UnmapResources (unsigned int count, ID3D10Resource **ppResources)}

Unmap Direct3D resources.

\textbf{Parameters}

- \texttt{count} - Number of resources to unmap for CUDA
- \texttt{ppResources} - Resources to unmap for CUDA

\textbf{Returns}

- \texttt{CUDA_SUCCESS}, \texttt{CUDA_ERROR_DEINITIALIZED}, \texttt{CUDA_ERROR_NOT_INITIALIZED}, \texttt{CUDA_ERROR_INVALID_CONTEXT}, \texttt{CUDA_ERROR_INVALID_VALUE}, \texttt{CUDA_ERROR_INVALID_HANDLE}, \texttt{CUDA_ERROR_NOT_MAPPED}, \texttt{CUDA_ERROR_UNKNOWN}

\textbf{Description}

\textbf{Deprecated} This function is deprecated as of CUDA 3.0.

Unmaps the \texttt{count} Direct3D resources in \texttt{ppResources}.

This function provides the synchronization guarantee that any CUDA kernels issued before \texttt{cuD3D10UnmapResources()} will complete before any Direct3D calls issued after \texttt{cuD3D10UnmapResources()} begin.

If any of \texttt{ppResources} have not been registered for use with CUDA or if \texttt{ppResources} contains any duplicate entries, then \texttt{CUDA_ERROR_INVALID_HANDLE} is returned. If any of \texttt{ppResources} are not presently mapped for access by CUDA, then \texttt{CUDA_ERROR_NOT_MAPPED} is returned.
Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsUnmapResources

CUresult cuD3D10UnregisterResource (ID3D10Resource *pResource)
Unregister a Direct3D resource.

Parameters

pResource
  - Resources to unregister

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 3.0.

Unregisters the Direct3D resource pResource so it is not accessible by CUDA unless registered again.

If pResource is not registered, then CUDA_ERROR_INVALID_HANDLE is returned.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

cuGraphicsUnregisterResource

5.31. Direct3D 11 Interoperability

This section describes the Direct3D 11 interoperability functions of the low-level CUDA driver application programming interface. Note that mapping of Direct3D 11 resources is performed with the graphics API agnostic, resource mapping interface described in Graphics Interoperability.
Direct3D 11 Interoperability [DEPRECATED]

**enum CUd3d11DeviceList**

CUDA devices corresponding to a D3D11 device

**Values**

- **CU_D3D11_DEVICE_LIST_ALL = 0x01**
  - The CUDA devices for all GPUs used by a D3D11 device
- **CU_D3D11_DEVICE_LIST_CURRENT_FRAME = 0x02**
  - The CUDA devices for the GPUs used by a D3D11 device in its currently rendering frame
- **CU_D3D11_DEVICE_LIST_NEXT_FRAME = 0x03**
  - The CUDA devices for the GPUs to be used by a D3D11 device in the next frame

**CUresult cuD3D11GetDevice (CUdevice *pCudaDevice, IDXGIAdapter *pAdapter)**

Gets the CUDA device corresponding to a display adapter.

**Parameters**

- **pCudaDevice** - Returned CUDA device corresponding to pAdapter
- **pAdapter** - Adapter to query for CUDA device

**Returns**

- CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_NO_DEVICE, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND, CUDA_ERROR_UNKNOWN

**Description**

Returns in *pCudaDevice the CUDA-compatible device corresponding to the adapter pAdapter obtained from IDXGIFactory::EnumAdapters.

If no device on pAdapter is CUDA-compatible the call will return CUDA_ERROR_NO_DEVICE.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuD3D11GetDevices, cudaD3D11GetDevice

CUresult cuD3D11GetDevices (unsigned int *pCudaDeviceCount, CUdevice *pCudaDevices, unsigned int cudaDeviceCount, ID3D11Device *pD3D11Device, CUd3d11DeviceList deviceList)

Gets the CUDA devices corresponding to a Direct3D 11 device.

Parameters
pcudaDeviceCount
  - Returned number of CUDA devices corresponding to pD3D11Device

pcudaDevices
  - Returned CUDA devices corresponding to pD3D11Device

cudaDeviceCount
  - The size of the output device array pCudaDevices

pD3D11Device
  - Direct3D 11 device to query for CUDA devices

deviceList
  - The set of devices to return. This set may be CU_D3D11_DEVICE_LIST_ALL for all devices, CU_D3D11_DEVICE_LIST_CURRENT_FRAME for the devices used to render the current frame (in SLI), or CU_D3D11_DEVICE_LIST_NEXT_FRAME for the devices used to render the next frame (in SLI).

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_NO_DEVICE,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_NOT_FOUND,
CUDA_ERROR_UNKNOWN

Description
Returns in *pCudaDeviceCount the number of CUDA-compatible device
corresponding to the Direct3D 11 device pD3D11Device. Also returns in
*pCudaDevices at most cudaDeviceCount of the CUDA-compatible devices
corresponding to the Direct3D 11 device pD3D11Device.
If any of the GPUs being used to render `pDevice` are not CUDA capable then the call will return `CUDA_ERROR_NO_DEVICE`.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuD3D11GetDevice, cudaD3D11GetDevices

```c
```

Register a Direct3D 11 resource for access by CUDA.

**Parameters**

- `pCudaResource` - Returned graphics resource handle
- `pD3DResource` - Direct3D resource to register
- `Flags` - Parameters for resource registration

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

**Description**

Registers the Direct3D 11 resource `pD3DResource` for access by CUDA and returns a CUDA handle to `pD3DResource` in `pCudaResource`. The handle returned in `pCudaResource` may be used to map and unmap this resource until it is unregistered. On success this call will increase the internal reference count on `pD3DResource`. This reference count will be decremented when this resource is unregistered through `cuGraphicsUnregisterResource()`.

This call is potentially high-overhead and should not be called every frame in interactive applications.

The type of `pD3DResource` must be one of the following,
- ID3D11Buffer: may be accessed through a device pointer.
- ID3D11Texture1D: individual subresources of the texture may be accessed via arrays
- ID3D11Texture2D: individual subresources of the texture may be accessed via arrays
- ID3D11Texture3D: individual subresources of the texture may be accessed via arrays

The Flags argument may be used to specify additional parameters at register time. The valid values for this parameter are:

- CU_GRAPHICS_REGISTER_FLAGS_NONE: Specifies no hints about how this resource will be used.
- CU_GRAPHICS_REGISTER_FLAGS_SURFACE_LDST: Specifies that CUDA will bind this resource to a surface reference.
- CU_GRAPHICS_REGISTER_FLAGS_TEXTURE_GATHER: Specifies that CUDA will perform texture gather operations on this resource.

Not all Direct3D resources of the above types may be used for interoperability with CUDA. The following are some limitations:

- The primary render target may not be registered with CUDA.
- Textures which are not of a format which is 1, 2, or 4 channels of 8, 16, or 32-bit integer or floating-point data cannot be shared.
- Surfaces of depth or stencil formats cannot be shared.

A complete list of supported DXGI formats is as follows. For compactness the notation $A_{B,C,D}$ represents $A_B$, $A_C$, and $A_D$.

- DXGI_FORMAT_A8_UNORM
- DXGI_FORMAT_B8G8R8A8_UNORM
- DXGI_FORMAT_B8G8R8X8_UNORM
- DXGI_FORMAT_R16_FLOAT
- DXGI_FORMAT_R16G16B16A16_[FLOAT,SINT,SNORM,UINT,UNORM]
- DXGI_FORMAT_R16G16_[FLOAT,SINT,SNORM,UINT,UNORM]
- DXGI_FORMAT_R16_[SINT,SNORM,UINT,UNORM]
- DXGI_FORMAT_R32_FLOAT
- DXGI_FORMAT_R32G32B32A32_[FLOAT,SINT,UINT]
- DXGI_FORMAT_R32G32_[FLOAT,SINT,UINT]
- DXGI_FORMAT_R32_[SINT,UINT]
- DXGI_FORMAT_R8G8B8A8_[SINT,SNORM,UINT,UNORM,UNORM_SRGB]
- DXGI_FORMAT_R8G8_[SINT,SNORM,UINT,UNORM]
- DXGI_FORMAT_R8_[SINT,SNORM,UINT,UNORM]

If pD3DResource is of incorrect type or is already registered then CUDA_ERROR_INVALID_HANDLE is returned. If pD3DResource cannot be registered then CUDA_ERROR_UNKNOWN is returned. If Flags is not one of the above specified value then CUDA_ERROR_INVALID_VALUE is returned.
Note that this function may also return error codes from previous, asynchronous launches.

cudaGraphicsD3D11RegisterResource

5.31.1. Direct3D 11 Interoperability [DEPRECATED]

Direct3D 11 Interoperability

This section describes deprecated Direct3D 11 interoperability functionality.

CUresult cuD3D11CtxCreate (CUcontext *pCtx, CUdevice *pCudaDevice, unsigned int Flags, ID3D11Device *pD3DDevice)
Create a CUDA context for interoperability with Direct3D 11.

Parameters

pCtx
  - Returned newly created CUDA context

pCudaDevice
  - Returned pointer to the device on which the context was created

Flags
  - Context creation flags (see cuCtxCreate() for details)

pD3DDevice
  - Direct3D device to create interoperability context with

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE,
CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 5.0.

This function is deprecated and should no longer be used. It is no longer necessary to associate a CUDA context with a D3D11 device in order to achieve maximum interoperability performance.
Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuD3D11GetDevice, cuGraphicsD3D11RegisterResource

CUresult cuD3D11CtxCreateOnDevice (CUcontext *pCtx, unsigned int flags, ID3D11Device *pD3DDevice, CUdevice cudaDevice)
Create a CUDA context for interoperability with Direct3D 11.

Parameters

pCtx
- Returned newly created CUDA context

flags
- Context creation flags (see cuCtxCreate() for details)

pD3DDevice
- Direct3D device to create interoperability context with

cudaDevice
- The CUDA device on which to create the context. This device must be among the devices returned when querying CU_D3D11_DEVICES_ALL from cuD3D11GetDevices.

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY, CUDA_ERROR_UNKNOWN

Description

Deprecated This function is deprecated as of CUDA 5.0.

This function is deprecated and should no longer be used. It is no longer necessary to associate a CUDA context with a D3D11 device in order to achieve maximum interoperability performance.

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuD3D11GetDevices, cuGraphicsD3D11RegisterResource

CUresult cuD3D11GetDirect3DDevice (ID3D11Device **ppD3DDevice)
Get the Direct3D 11 device against which the current CUDA context was created.

Parameters

ppD3DDevice
- Returned Direct3D device corresponding to CUDA context

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT

Description

Deprecated This function is deprecated as of CUDA 5.0.
This function is deprecated and should no longer be used. It is no longer necessary
to associate a CUDA context with a D3D11 device in order to achieve maximum
interoperability performance.

Note that this function may also return error codes from previous, asynchronous
launches.

See also:
cuD3D11GetDevice

5.32. VDPAU Interoperability

This section describes the VDPAU interoperability functions of the low-level CUDA
driver application programming interface.
CUresult cuGraphicsVDPAURegisterOutputSurface(CUgraphicsResource *pCudaResource, VdpOutputSurface vdpSurface, unsigned int flags)

Registers a VDPAU VdpOutputSurface object.

**Parameters**

- **pCudaResource**
  - Pointer to the returned object handle
- **vdpSurface**
  - The VdpOutputSurface to be registered
- **flags**
  - Map flags

**Returns**

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_ALREADY_MAPPED, CUDA_ERROR_INVALID_CONTEXT,

**Description**

Registers the VdpOutputSurface specified by `vdpSurface` for access by CUDA. A handle to the registered object is returned as `pCudaResource`. The surface's intended usage is specified using `flags`, as follows:

- **CU_GRAPHICS_MAP_RESOURCE_FLAGS_NONE**: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA. This is the default value.
- **CU_GRAPHICS_MAP_RESOURCE_FLAGS_READ_ONLY**: Specifies that CUDA will not write to this resource.
- **CU_GRAPHICS_MAP_RESOURCE_FLAGS_WRITE_DISCARD**: Specifies that CUDA will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.

The VdpOutputSurface is presented as an array of subresources that may be accessed using pointers returned by `cuGraphicsSubResourceGetMappedArray`. The exact number of valid `arrayIndex` values depends on the VDPAU surface format. The mapping is shown in the table below. `mipLevel` must be 0.

---

**Note** that this function may also return error codes from previous, asynchronous launches.
See also:
cuCtxCreate, cuVDPAUCtxCreate, cuGraphicsVDPAURegisterVideoSurface,
cuGraphicsUnregisterResource, cuGraphicsResourceSetMapFlags,
cuGraphicsMapResources, cuGraphicsUnmapResources,
cuGraphicsSubResourceGetMappedArray, cuVDPAGetDevice,
cudaGraphicsVDPAURegisterOutputSurface

CUresult cuGraphicsVDPAURegisterVideoSurface
(CUgraphicsResource *pCudaResource, VdpVideoSurface vdpSurface, unsigned int flags)
Registers a VDPAU VdpVideoSurface object.

Parameters
pCudaResource
- Pointer to the returned object handle
vdpSurface
- The VdpVideoSurface to be registered
flags
- Map flags

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_ALREADY_MAPPED, CUDA_ERROR_INVALID_CONTEXT,

Description
Registers the VdpVideoSurface specified by vdpSurface for access by CUDA. A handle to the registered object is returned as pCudaResource. The surface's intended usage is specified using flags, as follows:

- CU_GRAPHICS_MAP_RESOURCE_FLAGS_NONE: Specifies no hints about how this resource will be used. It is therefore assumed that this resource will be read from and written to by CUDA. This is the default value.
- CU_GRAPHICS_MAP_RESOURCE_FLAGS_READ_ONLY: Specifies that CUDA will not write to this resource.
- CU_GRAPHICS_MAP_RESOURCE_FLAGS_WRITE_DISCARD: Specifies that CUDA will not read from this resource and will write over the entire contents of the resource, so none of the data previously stored in the resource will be preserved.

The VdpVideoSurface is presented as an array of subresources that may be accessed using pointers returned by cuGraphicsSubResourceGetMappedArray. The exact number
of valid `arrayIndex` values depends on the VDPAU surface format. The mapping is shown in the table below. `mipLevel` must be 0.

Note that this function may also return error codes from previous, asynchronous launches.

See also:

**CU**result **cuVDPAUCtxCreate** (CUcontext *pCtx, unsigned int flags, CUdevice device, VdpDevice vdpDevice, VdpGetProcAddress *vdpGetProcAddress)

Create a CUDA context for interoperability with VDPAU.

**Parameters**

*pCtx*
- Returned CUDA context

*flags*
- Options for CUDA context creation

*device*
- Device on which to create the context

*vdpDevice*
- The VdpDevice to interop with

*vdpGetProcAddress*
- VDPAU’s VdpGetProcAddress function pointer

**Returns**

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED, CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT, CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

**Description**

Creates a new CUDA context, initializes VDPAU interoperability, and associates the CUDA context with the calling thread. It must be called before performing any other
VDPAU interoperability operations. It may fail if the needed VDPAU driver facilities are not available. For usage of the flags parameter, see cuCtxCreate().

Note that this function may also return error codes from previous, asynchronous launches.

See also:
cuCtxCreate, cuGraphicsVDPAURegisterVideoSurface,
cuGraphicsVDPAURegisterOutputSurface, cuGraphicsUnregisterResource,
cuGraphicsResourceSetMapFlags, cuGraphicsMapResources,
cuGraphicsUnmapResources, cuGraphicsSubResourceGetMappedArray,
cuVDPAUGetDevice

CUresult cuVDPAUGetDevice (CUdevice *pDevice, VdpDevice vdpDevice, VdpGetProcAddress *vdpGetProcAddress)

Gets the CUDA device associated with a VDPAU device.

Parameters

pDevice
- Device associated with vdpDevice

vdpDevice
- A VdpDevice handle

vdpGetProcAddress
- VDPAU’s VdpGetProcAddress function pointer

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE

Description

Returns in *pDevice the CUDA device associated with a vdpDevice, if applicable.

Note that this function may also return error codes from previous, asynchronous launches.
5.33. EGL Interoperability

This section describes the EGL interoperability functions of the low-level CUDA driver application programming interface.

CUresult cuEGLStreamConsumerAcquireFrame (CUeglStreamConnection *conn, CUgraphicsResource *pCudaResource, CUstream *pStream, unsigned int timeout)

Acquire an image frame from the EGLStream with CUDA as a consumer.

**Parameters**

*conn*
- Connection on which to acquire

*pCudaResource*
- CUDA resource on which the stream frame will be mapped for use.

*pStream*
- CUDA stream for synchronization and any data migrations implied by CUeglResourceLocationFlags.

timeout
- Desired timeout in usec.

**Returns**

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_LAUNCH_TIMEOUT,

**Description**

Acquire an image frame from EGLStreamKHR. cuGraphicsResourceGetMappedEglFrame can be called on pCudaResource to get CUeglFrame.

**See also:**
CUresult cuEGLStreamConsumerConnect
(CUEeglStreamConnection *conn, EGLStreamKHR stream)
Connect CUDA to EGLStream as a consumer.

Parameters

conn
- Pointer to the returned connection handle

stream
- EGLStreamKHR handle

Returns

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_INVALID_CONTEXT,

Description

Connect CUDA as a consumer to EGLStreamKHR specified by stream.
The EGLStreamKHR is an EGL object that transfers a sequence of image frames from
one API to another.

See also:

cuEGLStreamConsumerConnect, cuEGLStreamConsumerDisconnect,
cuEGLStreamConsumerAcquireFrame, cuEGLStreamConsumerReleaseFrame,
cudaEGLStreamConsumerAcquireFrame

CUresult cuEGLStreamConsumerConnectWithFlags
(CUEeglStreamConnection *conn, EGLStreamKHR stream,
unsigned int flags)
Connect CUDA to EGLStream as a consumer with given flags.

Parameters

conn
- Pointer to the returned connection handle

stream
- EGLStreamKHR handle
flags
- Flags denote intended location - system or video.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_INVALID_CONTEXT,

Description
Connect CUDA as a consumer to EGLStreamKHR specified by stream with specified flags defined by CUeglResourceLocationFlags.
The flags specify whether the consumer wants to access frames from system memory or video memory. Default is CU_EGL_RESOURCE_LOCATION_VIDMEM.

See also:
cuEGLStreamConsumerConnect, cuEGLStreamConsumerDisconnect,
cuEGLStreamConsumerAcquireFrame, cuEGLStreamConsumerReleaseFrame,
cudaEGLStreamConsumerConnectWithFlags

CUresult cuEGLStreamConsumerDisconnect
(CUEglStreamConnection *conn)
Disconnect CUDA as a consumer to EGLStream.

Parameters
conn
- Connection to disconnect.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_INVALID_CONTEXT,

Description
Disconnect CUDA as a consumer to EGLStreamKHR.
The EGLStreamKHR is an EGL object that transfers a sequence of image frames from one API to another.

See also:
CUresult cuEGLStreamConsumerReleaseFrame
(CUEglStreamConnection *conn, CUgraphicsResource pCudaResource, CUstream *pStream)
Releases the last frame acquired from the EGLStream.

Parameters
conn
  - Connection on which to release
pCudaResource
  - CUDA resource whose corresponding frame is to be released
pStream
  - CUDA stream on which release will be done.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,

Description
Release the acquired image frame specified by pCudaResource to EGLStreamKHR.
The EGLStreamKHR is an EGL object that transfers a sequence of image frames from
one API to another.

See also:
cuEGLStreamConsumerConnect, cuEGLStreamConsumerDisconnect,
cuEGLStreamConsumerAcquireFrame, cuEGLStreamConsumerReleaseFrame,
cudaEGLStreamConsumerReleaseFrame

CUresult cuEGLStreamProducerConnect
(CUEglStreamConnection *conn, EGLStreamKHR stream, EGLint width, EGLint height)
Connect CUDA to EGLStream as a producer.

Parameters
conn
  - Pointer to the returned connection handle
stream
- EGLStreamKHR handle

width
- width of the image to be submitted to the stream

height
- height of the image to be submitted to the stream

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_CONTEXT,

Description
Connect CUDA as a producer to EGLStreamKHR specified by stream.
The EGLStreamKHR is an EGL object that transfers a sequence of image frames from one API to another.

See also:
cuEGLStreamProducerConnect, cuEGLStreamProducerDisconnect, cuEGLStreamProducerPresentFrame, cudaEGLStreamProducerConnect

CUresult cuEGLStreamProducerDisconnect (CUeglStreamConnection *conn)
Disconnect CUDA as a producer to EGLStream.

Parameters
conn
- Connection to disconnect.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE, CUDA_ERROR_INVALID_CONTEXT,

Description
Disconnect CUDA as a producer to EGLStreamKHR.
The EGLStreamKHR is an EGL object that transfers a sequence of image frames from one API to another.

See also:
cuEGLStreamProducerConnect, cuEGLStreamProducerDisconnect, cuEGLStreamProducerPresentFrame, cudaEGLStreamProducerDisconnect

**CUresult cuEGLStreamProducerPresentFrame (CUeglStreamConnection *conn, CUeglFrame eglframe, CUstream *pStream)**

Present a CUDA eglFrame to the EGLStream with CUDA as a producer.

**Parameters**

- **conn**
  - Connection on which to present the CUDA array
- **eglframe**
  - CUDA Eglstream Producer Frame handle to be sent to the consumer over EglStream.
- **pStream**
  - CUDA stream on which to present the frame.

**Returns**

CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,

**Description**

The EGLStreamKHR is an EGL object that transfers a sequence of image frames from one API to another.

The **CUeglFrame** is defined as:

```c
typedef struct CUeglFrame_st {
    union {
        CUarray pArray[MAX_PLANES];
        void*   pPitch[MAX_PLANES];
    } frame;
    unsigned int width;
    unsigned int height;
    unsigned int depth;
    unsigned int pitch;
    unsigned int planeCount;
    unsigned int numChannels;
    CUeglFrameType frameType;
    CUeglColorFormat eglColorFormat;
    CUnArray_format cuFormat;
} CUeglFrame;
```

For **CUeglFrame** of type **CU_EGL_FRAME_TYPE_PITCH**, the application may present sub-region of a memory allocation. In that case, the pitched pointer will specify the start address of the sub-region in the allocation and corresponding **CUeglFrame** fields will specify the dimensions of the sub-region.

**See also:**
cuEGLStreamProducerConnect, cuEGLStreamProducerDisconnect, 
cuEGLStreamProducerReturnFrame, cudaEGLStreamProducerPresentFrame

CUresult cuEGLStreamProducerReturnFrame 
(CUEglStreamConnection *conn, CUEglFrame *eglframe, 
CUstream *pStream)
Return the CUDA eglFrame to the EGLStream released by the consumer.

Parameters
conn
  - Connection on which to return
eglframe
  - CUDA Eglstream Proucer Frame handle returned from the consumer over 
    EglStream.
pStream
  - CUDA stream on which to return the frame.

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE, 
CUDA_ERROR_LAUNCH_TIMEOUT

Description
The EGLStreamKHR is an EGL object that transfers a sequence of image frames from 
one API to another.

This API can potentially return CUDA_ERROR_LAUNCH_TIMEOUT if the consumer 
has not returned a frame to EGL stream. If timeout is returned the application can retry.

See also:
cuEGLStreamProducerConnect, cuEGLStreamProducerDisconnect, 
cuEGLStreamProducerPresentFrame, cudaEGLStreamProducerReturnFrame

CUresult cuEventCreateFromEGLSync (CUevent
*phEvent, EGLSyncKHR eglSync, unsigned int flags)
Creates an event from EGLSync object.

Parameters
phEvent
  - Returns newly created event
eglSync
- Opaque handle to EGLSync object

flags
- Event creation flags

Returns
CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_OUT_OF_MEMORY

Description
Creates an event *phEvent from an EGLSyncKHR eglSync with the flags specified via flags. Valid flags include:

- **CU_EVENT_DEFAULT**: Default event creation flag.
- **CU_EVENT_BLOCKING_SYNC**: Specifies that the created event should use blocking synchronization. A CPU thread that uses cuEventSynchronize() to wait on an event created with this flag will block until the event has actually been completed.

Once the eglSync gets destroyed, cuEventDestroy is the only API that can be invoked on the event.

cuEventRecord and TimingData are not supported for events created from EGLSync.

The EGLSyncKHR is an opaque handle to an EGL sync object. typedef void*
EGLSyncKHR

See also:
cuEventQuery, cuEventSynchronize, cuEventDestroy

**CUresult cuGraphicsEGLRegisterImage**

( CUgraphicsResource *pCudaResource, EGLImageKHR image, unsigned int flags)

Registers an EGL image.

Parameters

pCudaResource
- Pointer to the returned object handle

image
- An EGLImageKHR image which can be used to create target resource.
flags
  - Map flags

Returns
CUDA_SUCCESS, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_ALREADY_MAPPED, CUDA_ERROR_INVALID_CONTEXT,

Description
Registers the EGLImageKHR specified by image for access by CUDA. A handle to the
registered object is returned as pCudaResource. Additional Mapping/Unmapping is
not required for the registered resource and cuGraphicsResourceGetMappedEglFrame
can be directly called on the pCudaResource.

The application will be responsible for synchronizing access to shared objects. The
application must ensure that any pending operation which access the objects have
completed before passing control to CUDA. This may be accomplished by issuing and
waiting for glFinish command on all GLcontexts (for OpenGL and likewise for other
APIs). The application will be also responsible for ensuring that any pending operation
on the registered CUDA resource has completed prior to executing subsequent
commands in other APIs accessing the same memory objects. This can be accomplished
by calling cuCtxSynchronize or cuEventSynchronize (preferably).

The surface's intended usage is specified using flags, as follows:

- CU_GRAPHICS_MAP_RESOURCE_FLAGS_NONE: Specifies no hints about how
  this resource will be used. It is therefore assumed that this resource will be read
  from and written to by CUDA. This is the default value.
- CU_GRAPHICS_MAP_RESOURCE_FLAGS_READ_ONLY: Specifies that CUDA
  will not write to this resource.
- CU_GRAPHICS_MAP_RESOURCE_FLAGS_WRITE_DISCARD: Specifies that
  CUDA will not read from this resource and will write over the entire contents of the
  resource, so none of the data previously stored in the resource will be preserved.

The EGLImageKHR is an object which can be used to create EGLImage target resource.
It is defined as a void pointer. typedef void* EGLImageKHR

See also:
cuGraphicsEGLRegisterImage, cuGraphicsUnregisterResource,
cuGraphicsResourceSetMapFlags, cuGraphicsMapResources,
cuGraphicsUnmapResources, cudaGraphicsEGLRegisterImage
CUresult cuGraphicsResourceGetMappedEglFrame (CUeglFrame *eglFrame, CUgraphicsResource resource, unsigned int index, unsigned int mipLevel)

Get an eglFrame through which to access a registered EGL graphics resource.

Parameters

eglFrame
- Returned eglFrame.

resource
- Registered resource to access.

index
- Index for cubemap surfaces.

mipLevel
- Mipmap level for the subresource to access.

Returns

CUDA_SUCCESS, CUDA_ERROR_DEINITIALIZED,
CUDA_ERROR_NOT_INITIALIZED, CUDA_ERROR_INVALID_CONTEXT,
CUDA_ERROR_INVALID_VALUE, CUDA_ERROR_INVALID_HANDLE,
CUDA_ERROR_NOT_MAPPED

Description

Returns in *eglFrame an eglFrame pointer through which the registered graphics resource resource may be accessed. This API can only be called for EGL graphics resources.

The CUeglFrame is defined as:

```c
typedef struct CUeglFrame_st {
    union {
        CUarray pArray[MAX_PLANES];
        void* pPitch[MAX_PLANES];
    } frame;
    unsigned int width;
    unsigned int height;
    unsigned int depth;
    unsigned int pitch;
    unsigned int planeCount;
    unsigned int numChannels;
    CUeglFrameType frameType;
    CUeglColorFormat eglColorFormat;
    CUarray_format cuFormat;
} CUeglFrame;
```

If resource is not registered then CUDA_ERROR_NOT_MAPPED is returned.*

unsigned int CUDA_ARRAY_DESCRIPTOR::NumChannels
Channels per array element

size_t CUDA_ARRAY_DESCRIPTOR::Width
Width of array

6.3. CUDA_EXTERNAL_MEMORY_BUFFER_DESC Struct Reference
External memory buffer descriptor

unsigned int
CUDA_EXTERNAL_MEMORY_BUFFER_DESC::flags
Flags reserved for future use. Must be zero.

unsigned long long
CUDA_EXTERNAL_MEMORY_BUFFER_DESC::offset
Offset into the memory object where the buffer’s base is

unsigned long long
CUDA_EXTERNAL_MEMORY_BUFFER_DESC::size
Size of the buffer

6.4. CUDA_EXTERNAL_MEMORY_HANDLE_DESC Struct Reference
External memory handle descriptor

int CUDA_EXTERNAL_MEMORY_HANDLE_DESC::fd
File descriptor referencing the memory object. Valid when type is
CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD
unsigned int
CUDA_EXTERNAL_MEMORY_HANDLE_DESC::flags

Flags must either be zero or CUDA_EXTERNAL_MEMORY_DEDICATED

void *CUDA_EXTERNAL_MEMORY_HANDLE_DESC::handle

Valid NT handle. Must be NULL if 'name' is non-NULL.

const void
*CUDA_EXTERNAL_MEMORY_HANDLE_DESC::name

Name of a valid memory object. Must be NULL if 'handle' is non-NULL.

unsigned long long
CUDA_EXTERNAL_MEMORY_HANDLE_DESC::size

Size of the memory allocation

CUexternalMemoryHandleType
CUDA_EXTERNAL_MEMORY_HANDLE_DESC::type

Type of the handle

CUDA_EXTERNAL_MEMORY_HANDLE_DESC::@10::@11
CUDA_EXTERNAL_MEMORY_HANDLE_DESC::win32

Win32 handle referencing the semaphore object. Valid when type is one of the following:

- CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32
- CU_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT
- CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP
- CU_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE

Exactly one of 'handle' and 'name' must be non-NULL. If type is

CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT then

'name' must be NULL.

6.5. CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC

Struct Reference

External memory mipmap descriptor
struct CUDA_ARRAY3D_DESCRIPTOR
CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::arrayDesc

Format, dimension and type of base level of the mipmap chain

unsigned int
CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::numLevels

Total number of levels in the mipmap chain

unsigned long long
CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC::offset

Offset into the memory object where the base level of the mipmap chain is.

6.6. CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC

External semaphore handle descriptor

int CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::fd

File descriptor referencing the semaphore object. Valid when type is
CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD

unsigned int
CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::flags

Flags reserved for the future. Must be zero.

void
*CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::handle

Valid NT handle. Must be NULL if 'name' is non-NULL

const void
*CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::name

Name of a valid synchronization primitive. Must be NULL if 'handle' is non-NULL.
CUexternalSemaphoreHandleType
CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::type
Type of the handle

CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::@12::@13
CUDA_EXTERNAL_SEMAPHORE_HANDLE_DESC::win32
Win32 handle referencing the semaphore object. Valid when type is one of the following:

- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32
- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT
- CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE
  Exactly one of 'handle' and 'name' must be non-NULL. If type is
  CU_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT then
  'name' must be NULL.

6.7. CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS
Struct Reference

External semaphore signal parameters

CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS::@14::@15
CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS::fence
Parameters for fence objects

unsigned int
CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS::flags
Flags reserved for the future. Must be zero.

unsigned long long
CUDA_EXTERNAL_SEMAPHORE_SIGNAL_PARAMS::value
Value of fence to be signaled

First defined mipmap level

CUREsourceViewFormat
CUDARESOURCE_VIEW_DESC::format
Resource view format

size_t CUDARESOURCE_VIEW_DESC::height
Height of the resource view

unsigned int CUDARESOURCE_VIEW_DESC::lastLayer
Last layer index
unsigned int CUDA_RESOURCE_VIEW_DESC::lastMipmapLevel
Last defined mipmap level

size_t CUDA_RESOURCE_VIEW_DESC::width
Width of the resource view

6.19. CUDA_TEXTURE_DESC Struct Reference
Texture descriptor

CUaddress_mode CUDA_TEXTURE_DESC::addressMode
Address modes

float CUDA_TEXTURE_DESC::borderColor
Border Color

CUfilter_mode CUDA_TEXTURE_DESC::filterMode
Filter mode

unsigned int CUDA_TEXTURE_DESC::flags
Flags

unsigned int CUDA_TEXTURE_DESC::maxAnisotropy
Maximum anisotropy ratio

float CUDA_TEXTURE_DESC::maxMipmapLevelClamp
Mipmap maximum level clamp

float CUDA_TEXTURE_DESC::minMipmapLevelClamp
Mipmap minimum level clamp
**CUfilter_mode**
CUDA_TEXTURE_DESC::mipmapFilterMode
Mipmap filter mode

**float CUDA_TEXTURE_DESC::mipmapLevelBias**
Mipmap level bias

### 6.20. CUdevprop Struct Reference

Legacy device properties

**int CUdevprop::clockRate**
Clock frequency in kilohertz

**int CUdevprop::maxGridSize**
Maximum size of each dimension of a grid

**int CUdevprop::maxThreadsDim**
Maximum size of each dimension of a block

**int CUdevprop::maxThreadsPerBlock**
Maximum number of threads per block

**int CUdevprop::memPitch**
Maximum pitch in bytes allowed by memory copies

**int CUdevprop::regsPerBlock**
32-bit registers available per block

**int CUdevprop::sharedMemPerBlock**
Shared memory available per block in bytes
int CUdevprop::SIMDWidth
Warp size in threads

int CUdevprop::textureAlign
Alignment requirement for textures

int CUdevprop::totalConstantMemory
Constant memory available on device in bytes

6.21. CUeglFrame Struct Reference

CUDA EGLFrame structure Descriptor - structure defining one frame of EGL.
Each frame may contain one or more planes depending on whether the surface is
Multiplanar or not.

CUarray_format CUeglFrame::cuFormat
CUDA Array Format

unsigned int CUeglFrame::depth
Depth of first plane

CUeglColorFormat CUeglFrame::eglColorFormat
CUDA EGL Color Format

CUeglFrameType CUeglFrame::frameType
Array or Pitch

unsigned int CUeglFrame::height
Height of first plane

unsigned int CUeglFrame::numChannels
Number of channels for the plane
CUarray CUeglFrame::pArray
Array of CUarray corresponding to each plane

unsigned int CUeglFrame::pitch
Pitch of first plane

unsigned int CUeglFrame::planeCount
Number of planes

void *CUeglFrame::pPitch
Array of Pointers corresponding to each plane

unsigned int CUeglFrame::width
Width of first plane

6.22. CUipcEventHandle Struct Reference
CUDA IPC event handle

6.23. CUipcMemHandle Struct Reference
CUDA IPC mem handle

6.24. CUstreamBatchMemOpParams Union Reference
Per-operation parameters for cuStreamBatchMemOp
Chapter 7.
DATA FIELDS

Here is a list of all documented struct and union fields with links to the struct/union documentation for each field:

A
addressMode
   CUDA_TEXTURE_DESC
arrayDesc
   CUDA_EXTERNAL_MEMORY_MIPMAPPED_ARRAY_DESC

B
blockDimX
   CUDA_KERNEL_NODE_PARAMS
   CUDA_LAUNCH_PARAMS
blockDimY
   CUDA_LAUNCH_PARAMS
   CUDA_KERNEL_NODE_PARAMS
blockDimZ
   CUDA_LAUNCH_PARAMS
   CUDA_KERNEL_NODE_PARAMS
borderColor
   CUDA_TEXTURE_DESC

C
clockRate
   CUdevprop
cuFormat
   CUeglFrame
D

**depth**
- CUDA_RESOURCE_VIEW_DESC
- CUeglFrame

**Depth**
- CUDA_MEMCPY3D_PEER
- CUDA_ARRAY3D_DESCRIPTOR
- CUDA_MEMCPY3D

**devPtr**
- CUDARESOURCE_DESC

**dst**
- CUDA_MEMSET_NODE_PARAMS

**dstArray**
- CUDA_MEMCPY2D
- CUDA_MEMCPY3D
- CUDA_MEMCPY3D_PEER

**dstContext**
- CUDA_MEMCPY3D_PEER

**dstDevice**
- CUDA_MEMCPY2D
- CUDA_MEMCPY3D
- CUDA_MEMCPY3D_PEER

**dstHeight**
- CUDA_MEMCPY3D_PEER
- CUDA_MEMCPY3D

**dstHost**
- CUDA_MEMCPY2D
- CUDA_MEMCPY3D
- CUDA_MEMCPY3D_PEER

**dstLOD**
- CUDA_MEMCPY3D
- CUDA_MEMCPY3D_PEER

**dstMemoryType**
- CUDA_MEMCPY2D
- CUDA_MEMCPY3D_PEER
- CUDA_MEMCPY3D

**dstPitch**
- CUDA_MEMCPY2D
- CUDA_MEMCPY3D
- CUDA_MEMCPY3D_PEER

**dstXInBytes**
- CUDA_MEMCPY3D_PEER
- CUDA_MEMCPY3D
CUDA_MEMCPY2D
dstY
   CUDA_MEMCPY3D_PEER
   CUDA_MEMCPY3D

DEPRECATED LIST

Global CU_CTX_BLOCKING_SYNC
This flag was deprecated as of CUDA 4.0 and was replaced with CU_CTX_SCHED_BLOCKING_SYNC.

Global CU_DEVICE_P2P_ATTRIBUTE_ACCESS_ACCESS_SUPPORTED
use CU_DEVICE_P2P_ATTRIBUTE_CUDA_ARRAY_ACCESS_SUPPORTED instead

Global CUDA_ERROR_PROFILER_NOT_INITIALIZED
This error return is deprecated as of CUDA 5.0. It is no longer an error to attempt to enable/disable the profiling via cuProfilerStart or cuProfilerStop without initialization.

Global CUDA_ERROR_PROFILER_ALREADY_STARTED
This error return is deprecated as of CUDA 5.0. It is no longer an error to call cuProfilerStart() when profiling is already enabled.

Global CUDA_ERROR_PROFILER_ALREADY_STOPPED
This error return is deprecated as of CUDA 5.0. It is no longer an error to call cuProfilerStop() when profiling is already disabled.

Global CUDA_ERROR_CONTEXT_ALREADY_CURRENT
This error return is deprecated as of CUDA 3.2. It is no longer an error to attempt to push the active context via cuCtxPushCurrent().

Global cuGLCtxCreate
   This function is deprecated as of Cuda 5.0.

Global cuGLInit
   This function is deprecated as of Cuda 3.0.

Global cuGLMapBufferObject
   This function is deprecated as of Cuda 3.0.

Global cuGLMapBufferObjectAsync
   This function is deprecated as of Cuda 3.0.

Global cuGLRegisterBufferObject
   This function is deprecated as of Cuda 3.0.

Global cuGLSetBufferObjectMapFlags
   This function is deprecated as of Cuda 3.0.

Global cuGLUnmapBufferObject
   This function is deprecated as of Cuda 3.0.
Global `cuGLUnmapBufferObjectAsync`
This function is deprecated as of Cuda 3.0.

Global `cuGLUnregisterBufferObject`
This function is deprecated as of Cuda 3.0.

Global `cuD3D9MapResources`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9RegisterResource`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9ResourceGetMappingedArray`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9ResourceGetMappingedPitch`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9ResourceGetMappingedPointer`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9ResourceGetMappingedSize`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9ResourceGetSurfaceDimensions`
This function is deprecated as of CUDA 3.0.

Global `cuD3D9ResourceSetMapFlags`
This function is deprecated as of Cuda 3.0.
Global cuD3D9UnmapResources
This function is deprecated as of CUDA 3.0.

Global cuD3D9UnregisterResource
This function is deprecated as of CUDA 3.0.

Global cuD3D10CtxCreate
This function is deprecated as of CUDA 5.0.

Global cuD3D10CtxCreateOnDevice
This function is deprecated as of CUDA 5.0.

Global cuD3D10GetDirect3DDevice
This function is deprecated as of CUDA 5.0.

Global cuD3D10MapResources
This function is deprecated as of CUDA 3.0.

Global cuD3D10RegisterResource
This function is deprecated as of CUDA 3.0.

Global cuD3D10ResourceGetMappedArray
This function is deprecated as of CUDA 3.0.

Global cuD3D10ResourceGetMappedPitch
This function is deprecated as of CUDA 3.0.

Global cuD3D10ResourceGetMappedPointer
This function is deprecated as of CUDA 3.0.
Global cuD3D10ResourceGetMappedSize
This function is deprecated as of CUDA 3.0.

Global cuD3D10ResourceGetSurfaceDimensions
This function is deprecated as of CUDA 3.0.

Global cuD3D10ResourceSetMapFlags
This function is deprecated as of CUDA 3.0.

Global cuD3D10UnmapResources
This function is deprecated as of CUDA 3.0.

Global cuD3D10UnregisterResource
This function is deprecated as of CUDA 3.0.

Global cuD3D11CtxCreate
This function is deprecated as of CUDA 5.0.

Global cuD3D11CtxCreateOnDevice
This function is deprecated as of CUDA 5.0.

Global cuD3D11GetDirect3DDevice
This function is deprecated as of CUDA 5.0.
