  How do I install the Toolkit in a different location?......................................55
  Why do I see “nvcc: No such file or directory” when I try to build a CUDA application?........55
  Why do I see “error while loading shared libraries: <lib name>: cannot open shared object file: No such file or directory” when I try to run a CUDA application that uses a CUDA library?.................................................................56
  Why do I see multiple “404 Not Found” errors when updating my repository meta-data on Ubuntu?.................................................................56
  How can I tell X to ignore a GPU for compute-only use?.............................56
  Why doesn’t the cuda-repo package install the CUDA Toolkit and Drivers?.......................56
  How do I get CUDA to work on a laptop with an iGPU and a dGPU running Ubuntu14.04?.....57
  What do I do if the display does not load, or CUDA does not work, after performing a system update?.................................................................57
  How do I install a CUDA driver with a version less than 367 using a network repo?........58
  How do I install an older CUDA version using a network repo?.....................58
  Why does the installation on SUSE install the Mesa-dri-nouveau dependency?........58

Chapter 15. Additional Considerations........................................................59

Chapter 16. Removing CUDA Toolkit and Driver........................................60
Chapter 1. Introduction

CUDA® is a parallel computing platform and programming model invented by NVIDIA®. It enables dramatic increases in computing performance by harnessing the power of the graphics processing unit (GPU).

CUDA was developed with several design goals in mind:

- Provide a small set of extensions to standard programming languages, like C, that enable a straightforward implementation of parallel algorithms. With CUDA C/C++, programmers can focus on the task of parallelization of the algorithms rather than spending time on their implementation.

- Support heterogeneous computation where applications use both the CPU and GPU. Serial portions of applications are run on the CPU, and parallel portions are offloaded to the GPU. As such, CUDA can be incrementally applied to existing applications. The CPU and GPU are treated as separate devices that have their own memory spaces. This configuration also allows simultaneous computation on the CPU and GPU without contention for memory resources.

CUDA-capable GPUs have hundreds of cores that can collectively run thousands of computing threads. These cores have shared resources including a register file and a shared memory. The on-chip shared memory allows parallel tasks running on these cores to share data without sending it over the system memory bus.

This guide will show you how to install and check the correct operation of the CUDA development tools.

1.1. System Requirements

To use CUDA on your system, you will need the following installed:

- CUDA-capable GPU

- A supported version of Linux with a gcc compiler and toolchain

The CUDA development environment relies on tight integration with the host development environment, including the host compiler and C runtime libraries, and is therefore only supported on distribution versions that have been qualified for this CUDA Toolkit release.
Introduction

The following table lists the supported Linux distributions. Please review the footnotes associated with the table.

Table 1. Native Linux Distribution Support in CUDA 11.5

<table>

</tbody>
</table>

(1) The following notes apply to the kernel versions supported by CUDA:

- For specific kernel versions supported on Red Hat Enterprise Linux (RHEL), visit [https://access.redhat.com/articles/3078](https://access.redhat.com/articles/3078).

- For Ubuntu LTS on x86-64, both the HWE kernel (e.g. 5.x for 18.04) and the server LTS kernel (e.g. 4.15.x for 18.04) are supported in CUDA 11.5. Visit [https://wiki.ubuntu.com/Kernel/Support](https://wiki.ubuntu.com/Kernel/Support) for more information.

(2) Note that starting with CUDA 11.0, the minimum recommended GCC compiler is at least GCC 6 due to C++11 requirements in CUDA libraries e.g. cuFFT and CUB. On
distributions such as RHEL 7 or CentOS 7 that may use an older GCC toolchain by default, it is recommended to use a newer GCC toolchain with CUDA 11.0. Newer GCC toolchains are available with the Red Hat Developer Toolset. For platforms that ship a compiler version older than GCC 6 by default, linking to static cuBLAS and cuDNN using the default compiler is not supported.

(3) Minor versions of the following compilers listed: of GCC, ICC, NVHPC and XLC, as host compilers for nvcc are supported.

1.2. About This Document

This document is intended for readers familiar with the Linux environment and the compilation of C programs from the command line. You do not need previous experience with CUDA or experience with parallel computation. Note: This guide covers installation only on systems with X Windows installed.

Note: Many commands in this document might require superuser privileges. On most distributions of Linux, this will require you to log in as root. For systems that have enabled the sudo package, use the sudo prefix for all necessary commands.
Chapter 2. Pre-installation Actions

Some actions must be taken before the CUDA Toolkit and Driver can be installed on Linux:

- Verify the system has a CUDA-capable GPU.
- Verify the system is running a supported version of Linux.
- Verify the system has gcc installed.
- Verify the system has the correct kernel headers and development packages installed.
- Download the NVIDIA CUDA Toolkit.
- Handle conflicting installation methods.

Note: You can override the install-time prerequisite checks by running the installer with the --override flag. Remember that the prerequisites will still be required to use the NVIDIA CUDA Toolkit.

2.1. Verify You Have a CUDA-Capable GPU

To verify that your GPU is CUDA-capable, go to your distribution’s equivalent of System Properties, or, from the command line, enter:

```
lspci | grep -i nvidia
```

If you do not see any settings, update the PCI hardware database that Linux maintains by entering `update-pciids` (generally found in `/sbin`) at the command line and rerun the previous `lspci` command.

If your graphics card is from NVIDIA and it is listed in https://developer.nvidia.com/cuda-gpus, your GPU is CUDA-capable.

The Release Notes for the CUDA Toolkit also contain a list of supported products.
2.2. Verify You Have a Supported Version of Linux

The CUDA Development Tools are only supported on some specific distributions of Linux. These are listed in the CUDA Toolkit release notes.

To determine which distribution and release number you’re running, type the following at the command line:

```
uname -m && cat /etc/*release
```

You should see output similar to the following, modified for your particular system:

```
x86_64
Red Hat Enterprise Linux Workstation release 6.0 (Santiago)
```

The x86_64 line indicates you are running on a 64-bit system. The remainder gives information about your distribution.

2.3. Verify the System Has gcc Installed

The gcc compiler is required for development using the CUDA Toolkit. It is not required for running CUDA applications. It is generally installed as part of the Linux installation, and in most cases the version of gcc installed with a supported version of Linux will work correctly.

To verify the version of gcc installed on your system, type the following on the command line:

```
gcc --version
```

If an error message displays, you need to install the development tools from your Linux distribution or obtain a version of gcc and its accompanying toolchain from the Web.

2.4. Verify the System has the Correct Kernel Headers and Development Packages Installed

The CUDA Driver requires that the kernel headers and development packages for the running version of the kernel be installed at the time of the driver installation, as well whenever the driver is rebuilt. For example, if your system is running kernel version 3.17.4-301, the 3.17.4-301 kernel headers and development packages must also be installed.

While the Runfile installation performs no package validation, the RPM and Deb installations of the driver will make an attempt to install the kernel header and development packages if no version of these packages is currently installed. However, it will install the latest version of these packages, which may or may not match the version of the kernel your system is
Therefore, it is best to manually ensure the correct version of the kernel headers and development packages are installed prior to installing the CUDA Drivers, as well as whenever you change the kernel version.

The version of the kernel your system is running can be found by running the following command:

```
uname -r
```

This is the version of the kernel headers and development packages that must be installed prior to installing the CUDA Drivers. This command will be used multiple times below to specify the version of the packages to install. Note that below are the common-case scenarios for kernel usage. More advanced cases, such as custom kernel branches, should ensure that their kernel headers and sources match the kernel build they are running.

**Note:** If you perform a system update which changes the version of the linux kernel being used, make sure to rerun the commands below to ensure you have the correct kernel headers and kernel development packages installed. Otherwise, the CUDA Driver will fail to work with the new kernel.

**RHEL7/CentOS7**

The kernel headers and development packages for the currently running kernel can be installed with:

```
sudo yum install kernel-devel-$(uname -r) kernel-headers-$(uname -r)
```

**Fedora/RHEL8/CentOS8**

The kernel headers and development packages for the currently running kernel can be installed with:

```
sudo dnf install kernel-devel-$(uname -r) kernel-headers-$(uname -r)
```

If matching kernel-headers and kernel-devel packages are not available for the currently running kernel version, you may need to use the previously shipped version of these packages. See [https://bugzilla.redhat.com/show_bug.cgi?id=1986132](https://bugzilla.redhat.com/show_bug.cgi?id=1986132) for more information.

**OpenSUSE/SLES**

The kernel development packages for the currently running kernel can be installed with:

```
sudo zypper install -y kernel-<variant>-devel=<version>
```

To run the above command, you will need the variant and version of the currently running kernel. Use the output of the `uname` command to determine the currently running kernel’s variant and version:

```
$ uname -r
3.16.6-2-default
```
In the above example, the variant is `default` and version is `3.16.6-2`.

The kernel development packages for the default kernel variant can be installed with:

```
sudo zypper install -y kernel-default-devel=$(uname -r | sed 's/\-default//')
```

**WSL**

This section does not need to be performed for WSL.

**Ubuntu**

The kernel headers and development packages for the currently running kernel can be installed with:

```
sudo apt-get install linux-headers-$(uname -r)
```

### 2.5. Install MLNX_OFED

If you intend to use GPUDirectStorage (GDS), you must install the CUDA package and MLNX_OFED package.

GDS packages can be installed using the CUDA packaging guide. Follow the instructions in [MLNX_OFED Requirements and Installation](#).

GDS is supported in two different modes: GDS (default/full perf mode) and Compatibility mode. Installation instructions for them differ slightly. Compatibility mode is the only mode that is supported on certain distributions due to software dependency limitations.

Full GDS support is restricted to the following Linux distros:

- Ubuntu 18.04, 20.04
- RHEL 8.3, RHEL 8.4

### 2.6. Choose an Installation Method

The CUDA Toolkit can be installed using either of two different installation mechanisms: distribution-specific packages (RPM and Deb packages), or a distribution-independent package (runfile packages).

The distribution-independent package has the advantage of working across a wider set of Linux distributions, but does not update the distribution’s native package management system. The distribution-specific packages interface with the distribution’s native package management system. It is recommended to use the distribution-specific packages, where possible.

**Note:** Standalone installers are not provided for architectures other than the x86_64 release. For both native as well as cross development, the toolkit must be installed using the

```
```
2.7. **Download the NVIDIA CUDA Toolkit**

Choose the platform you are using and download the NVIDIA CUDA Toolkit. The CUDA Toolkit contains the CUDA driver and tools needed to create, build and run a CUDA application as well as libraries, header files, CUDA samples source code, and other resources.

**Download Verification**

The download can be verified by comparing the MD5 checksum posted at [https://developer.download.nvidia.com/compute/cuda/11.5.1/docs/sidebar/md5sum.txt](https://developer.download.nvidia.com/compute/cuda/11.5.1/docs/sidebar/md5sum.txt) with that of the downloaded file. If either of the checksums differ, the downloaded file is corrupt and needs to be downloaded again.

To calculate the MD5 checksum of the downloaded file, run the following:

```
md5sum <file>
```

2.8. **Handle Conflicting Installation Methods**

Before installing CUDA, any previously installations that could conflict should be uninstalled. This will not affect systems which have not had CUDA installed previously, or systems where the installation method has been preserved (RPM/Deb vs. Runfile). See the following charts for specifics.

**Table 2. CUDA Toolkit Installation Compatibility Matrix**

<table>
<thead>
<tr>
<th>Installed Toolkit Version == X.Y</th>
<th>Installed Toolkit Version != X.Y</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPM/Deb run</td>
<td>RPM/Deb run</td>
</tr>
<tr>
<td>Uninstall Run</td>
<td>No Action</td>
</tr>
</tbody>
</table>

**Table 3. NVIDIA Driver Installation Compatibility Matrix**

<table>
<thead>
<tr>
<th>Installed Driver Version == X.Y</th>
<th>Installed Driver Version != X.Y</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPM/Deb run</td>
<td>RPM/Deb run</td>
</tr>
</tbody>
</table>
Use the following command to uninstall a Toolkit runfile installation:

```
sudo /usr/local/cuda-X.Y/bin/cuda-uninstaller
```

Use the following command to uninstall a Driver runfile installation:

```
sudo /usr/bin/nvidia-uninstall
```

Use the following commands to uninstall an RPM/Deb installation:

```
sudo dnf remove <package_name>               # RHEL8/CentOS8
sudo yum remove <package_name>               # RHEL7/CentOS7
sudo dnf remove <package_name>               # Fedora
sudo zypper remove <package_name>            # OpenSUSE/SLES
sudo apt-get --purge remove <package_name>   # Ubuntu
```
Chapter 3. Package Manager Installation

Basic instructions can be found in the Quick Start Guide. Read on for more detailed instructions.

3.1. Overview

The Package Manager installation interfaces with your system’s package management system. When using RPM or Deb, the downloaded package is a repository package. Such a package only informs the package manager where to find the actual installation packages, but will not install them.

If those packages are available in an online repository, they will be automatically downloaded in a later step. Otherwise, the repository package also installs a local repository containing the installation packages on the system. Whether the repository is available online or installed locally, the installation procedure is identical and made of several steps.

Distribution-specific instructions detail how to install CUDA:

- RHEL7/CentOS7
- RHEL8/CentOS8
- Fedora
- SLES
- OpenSUSE
- WSL
- Ubuntu
- Debian

Finally, some helpful package manager capabilities are detailed.
These instructions are for native development only. For cross-platform development, see the [CUDA Cross-Platform Environment](#) section.

**Note:** Optional components such as `nvidia-fs`, `libnvidia_nscq`, and `fabricmanager` are not installed by default and will have to be installed separately as needed.

**Note:** The package `cuda-core` has been deprecated in CUDA 9.1. Please use `cuda-compiler` instead.

### 3.2. RHEL7/CentOS7

1. Perform the [pre-installation actions](#).

2. **Satisfy third-party package dependency**

   - **Satisfy DKMS dependency:** The NVIDIA driver RPM packages depend on other external packages, such as DKMS and `libvdpau`. Those packages are only available on third-party repositories, such as [EPEL](https://www.fedoraproject.org/wiki/EPEL). Any such third-party repositories must be added to the package manager repository database before installing the NVIDIA driver RPM packages, or missing dependencies will prevent the installation from proceeding.

     To enable EPEL:

     ```
     ```

   - **Enable optional repos:**

     On RHEL 7 Linux only, execute the following steps to enable optional repositories.

     - **On x86_64 workstation:**
       ```
       subscription-manager repos --enable=rhel-7-workstation-optional-rpms
       ```
     - **On POWER9 system:**
       ```
       subscription-manager repos --enable=rhel-7-for-power-9-optional-rpms
       ```
     - **On x86_64 server:**
       ```
       subscription-manager repos --enable=rhel-7-server-optional-rpms
       ```

3. **Address custom xorg.conf, if applicable**

   The driver relies on an automatically generated `xorg.conf` file at `/etc/X11/xorg.conf`. If a custom-built `xorg.conf` file is present, this functionality will be disabled and the driver may not work. You can try removing the existing `xorg.conf` file, or adding the contents of `/etc/X11/xorg.conf.d/00-nvidia.conf` to the `xorg.conf` file. The `xorg.conf` file will most likely need manual tweaking for systems with a non-trivial GPU configuration.

4. **Install repository meta-data**

   When installing using the local repo:

   ```
sudo rpm --install cuda-repo-<distro>-<version>.<architecture>.rpm
   ```
When installing using the network repo:

```
```

5. **Clean Yum repository cache**

```
sudo yum clean expire-cache
```

6. **Install CUDA**

```
sudo yum install nvidia-driver-latest-dkms
sudo yum install cuda
sudo yum install cuda-drivers
```

7. **Add libcuda.so symbolic link, if necessary**

The libcuda.so library is installed in the `/usr/lib{,64}/nvidia` directory. For pre-existing projects which use libcuda.so, it may be useful to add a symbolic link from libcuda.so in the `/usr/lib{,64}/` directory.

8. Perform the [post-installation actions](#).

### 3.3. RHEL8/CentOS8

1. Perform the [pre-installation actions](#).

2. **Satisfy third-party package dependency**

   ▶ **Satisfy DKMS dependency:** The NVIDIA driver RPM packages depend on other external packages, such as DKMS and libvdpau. Those packages are only available on third-party repositories, such as EPEL. Any such third-party repositories must be added to the package manager repository database before installing the NVIDIA driver RPM packages, or missing dependencies will prevent the installation from proceeding.

   To enable EPEL:

   ```
```

   ▶ **Enable optional repos:**

   On RHEL 8 Linux only, execute the following steps to enable optional repositories.

   ▶ **On x86_64 systems:**

   ```
   subscription-manager repos --enable=rhel-8-for-x86_64-appstream-rpms
   subscription-manager repos --enable=rhel-8-for-x86_64-baseos-rpms
   subscription-manager repos --enable=codeready-builder-for-rhel-8-x86_64-rpms
   ```

   ▶ **On POWER9 systems:**

   ```
   subscription-manager repos --enable=rhel-8-for-ppc64le-appstream-rpms
   subscription-manager repos --enable=rhel-8-for-ppc64le-baseos-rpms
   subscription-manager repos --enable=codeready-builder-for-rhel-8-ppc64le-rpms
   ```

3. **Address custom xorg.conf, if applicable**
The driver relies on an automatically generated `xorg.conf` file at `/etc/X11/xorg.conf`. If a custom-built `xorg.conf` file is present, this functionality will be disabled and the driver may not work. You can try removing the existing `xorg.conf` file, or adding the contents of `/etc/X11/xorg.conf.d/00-nvidia.conf` to the `xorg.conf` file. The `xorg.conf` file will most likely need manual tweaking for systems with a non-trivial GPU configuration.

4. **Install repository meta-data**
   
   When installing using the local repo:
   ```bash
   sudo rpm --install cuda-repo-<distro>-<version>.<architecture>.rpm
   ```
   
   When installing using the network repo:
   ```bash
   ```

5. **Clean Yum repository cache**
   
   ```bash
   sudo yum clean expire-cache
   ```
   
   To include all GDS packages:
   ```bash
   sudo dnf install nvidia-gds
   ```

6. **Install CUDA**
   
   ```bash
   sudo dnf clean expire-cache
   sudo dnf module install nvidia-driver:latest-dkms
   sudo dnf install cuda
   ```

7. **Add libcuda.so symbolic link, if necessary**
   
   The `libcuda.so` library is installed in the `/usr/lib{,64}/nvidia` directory. For pre-existing projects which use `libcuda.so`, it may be useful to add a symbolic link from `libcuda.so` in the `/usr/lib{,64}` directory.

8. Perform the **post-installation actions.**

### 3.4. Fedora

1. Perform the **pre-installation actions.**

2. **Address custom xorg.conf, if applicable**
   
   The driver relies on an automatically generated `xorg.conf` file at `/etc/X11/xorg.conf`. If a custom-built `xorg.conf` file is present, this functionality will be disabled and the driver may not work. You can try removing the existing `xorg.conf` file, or adding the contents of `/etc/X11/xorg.conf.d/00-nvidia.conf` to the `xorg.conf` file. The `xorg.conf` file will most likely need manual tweaking for systems with a non-trivial GPU configuration.

3. **Install repository meta-data**
   
   When installing using the local repo:
   ```bash
   sudo rpm --install cuda-repo-fedora33-<version>.x86_64.rpm
   ```
When installing using the network repo:

```
```

4. **Clean DNF repository cache**

```
sudo dnf clean expire-cache
```

5. **Install CUDA**

```
sudo dnf module install nvidia-driver:latest-dkms
sudo dnf install cuda
```

The CUDA driver installation may fail if the RPMFusion non-free repository is enabled. In this case, CUDA installations should temporarily disable the RPMFusion non-free repository:

```
sudo dnf --disablerepo="rpmfusion-nonfree*" install cuda
```

It may be necessary to rebuild the grub configuration files, particularly if you use a non-default partition scheme. If so, then run this below command, and reboot the system:

```
sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

Remember to reboot the system.

6. **Add libcudava symbolic link, if necessary**

   The `libcudava` library is installed in the `/usr/lib{,64}/nvidia` directory. For pre-existing projects which use `libcudava`, it may be useful to add a symbolic link from `libcudava` in the `/usr/lib{,64}` directory.

7. Perform the **post-installation actions**.

### 3.5. **SLES**

1. Perform the **pre-installation actions**.

2. On SLES12 SP4, install the Mesa-libgl-devel Linux packages before proceeding. See [Mesa-libGL-devel](#).

3. **Install repository meta-data**

   When installing using the local repo:

   ```
sudo rpm --install cuda-repo-sles15-<version>.<architecture>.rpm
   ```

   When installing using the network repo:

   ```
   ```

4. **Refresh Zypper repository cache**

   ```
sudo SUSEConnect --product PackageHub/15/<architecture>
   ```
5. **Install CUDA**

   ```bash
   sudo zypper install cuda
   ```

6. **Add the user to the video group**

   ```bash
   sudo usermod -a -G video <username>
   ```

7. **Install CUDA Samples GL dependencies**

   The CUDA Samples package on SLES does not include dependencies on GL and X11 libraries as these are provided in the SLES SDK. These packages must be installed separately, depending on which samples you want to use.

8. Perform the **post-installation actions.**

### 3.6. **OpenSUSE**

1. Perform the **pre-installation actions.**

2. **Install repository meta-data**

   When installing using the local repo:

   ```bash
   sudo rpm --install cuda-repo-opensuse15-<version>.x86_64.rpm
   ```

   When installing using the network repo:

   ```bash
   ```

3. **Refresh Zypper repository cache**

   ```bash
   sudo zypper refresh
   ```

4. **Install CUDA**

   ```bash
   sudo zypper install cuda
   ```

5. **Add the user to the video group**

   ```bash
   sudo usermod -a -G video <username>
   ```

6. Perform the **post-installation actions.**

### 3.7. **WSL**

These instructions must be used if you are installing in a WSL environment. Do not use the Ubuntu instructions in this case.

1. Perform the **pre-installation actions.**

2. **Install repository meta-data**
When installing using the local repo:

```
sudo dpkg -i cuda-repo-<distro>_<version>_x86_64.deb
```

When installing using the network repo:

```
sudo add-apt-repository "deb https://developer.download.nvidia.com/compute/cuda/repos/<distro>/x86_64/ /"
```

3. **Installing the CUDA public GPG key**

   When installing using the local repo:

   ```
sudo apt-key add /var/cuda-repo-<version>/7fa2af80.pub
```

   When installing using the network repo:

   ```
sudo apt-key adv --fetch-keys https://developer.download.nvidia.com/compute/cuda/repos/<distro>/x86_64/7fa2af80.pub
```

   Pin file to prioritize CUDA repository:

   ```
sudo mv cuda-<distro>.pin /etc/apt/preferences.d/cuda-repository-pin-600
```

4. **Update the Apt repository cache**

   ```
sudo apt-get update
```

5. **Install CUDA**

   ```
sudo apt-get install cuda
```

6. Perform the _post-installation actions._

### 3.8. Ubuntu

1. Perform the _pre-installation actions._

2. **Install repository meta-data**

   ```
sudo dpkg -i cuda-repo-<distro>_<version>_<architecture>.deb
```

3. **Install the CUDA public GPG key**

   When installing using the local repo:

   ```
sudo apt-key add /var/cuda-repo-<distro>-<version>/7fa2af80.pub
```

   When installing using network repo on Ubuntu 20.04/18.04:

   ```
sudo apt-key adv --fetch-keys https://developer.download.nvidia.com/compute/cuda/repos/<distro>/<architecture>/7fa2af80.pub
```
When installing using network repo on Ubuntu 16.04:
```
sudo apt-key adv --fetch-keys http://developer.download.nvidia.com/compute/cuda/repos/<distro>/<architecture>/7fa2af80.pub
```

Pin file to prioritize CUDA repository:
```
```
```
sudo mv cuda-<distro>.pin /etc/apt/preferences.d/cuda-repository-pin-600
```

4. **Update the Apt repository cache**
```
sudo apt-get update
```

5. **Install CUDA**

   **Note:** These two commands must be executed separately.
```
sudo apt-get install cuda
```

   To include all GDS packages:
```
sudo apt-get install nvidia-gds
```

6. **Perform the post-installation actions.**

### 3.9. Debian

1. **Perform the pre-installation actions.**

2. **Install repository meta-data**
   
   When installing using the local repo:
   ```
sudo dpkg -i cuda-repo-debian10_<version>_x86_64.deb
   ```

   When installing using the network repo:
   ```
sudo add-apt-repository "deb https://developer.download.nvidia.com/compute/cuda/repos/debian10/x86_64/ /
   ```

3. **Installing the CUDA public GPG key**
   
   When installing using the local repo:
   ```
sudo apt-key add /var/cuda-repo-<version>/7fa2af80.pub
   ```

   When installing using the network repo:
   ```
sudo apt-key adv --fetch-keys https://developer.download.nvidia.com/compute/cuda/repos/debian10/x86_64/7fa2af80.pub
   ```
4. **Enable the contrib repository:**
   ```
sudo add-apt-repository contrib
   ```

5. **Update the Apt repository cache**
   ```
sudo apt-get update
   ```
   **Note:** If you are using Debian 10, you may instead need to run:
   ```
sudo apt-get --allow-releaseinfo-change update
   ```

6. **Install CUDA**
   ```
sudo apt-get -y install cuda
   ```

7. Perform the [post-installation actions](#).

### 3.10. Additional Package Manager Capabilities

Below are some additional capabilities of the package manager that users can take advantage of.

#### 3.10.1. Available Packages

The recommended installation package is the `cuda` package. This package will install the full set of other CUDA packages required for native development and should cover most scenarios.

The `cuda` package installs all the available packages for native developments. That includes the compiler, the debugger, the profiler, the math libraries, and so on. For x86_64 platforms, this also include Nsight Eclipse Edition and the visual profilers. It also includes the NVIDIA driver package.

On supported platforms, the `cuda-cross-aarch64` and `cuda-cross-ppc64el` packages install all the packages required for cross-platform development to ARMv8 and POWER8, respectively. The libraries and header files of the target architecture’s display driver package are also installed to enable the cross compilation of driver applications. The `cuda-cross-<arch>` packages do not install the native display driver.

The packages installed by the packages above can also be installed individually by specifying their names explicitly. The list of available packages be can obtained with:

- `yum --disablerepo="*" --enablerepo="cuda*" list available` # RedHat
- `dnf --disablerepo="*" --enablerepo="cuda*" list available` # Fedora
- `zypper packages -r cuda` # OpenSUSE & SLES
- `cat /var/lib/apt/lists/*cuda*Packages | grep "Package:"` # Ubuntu
3.10.2. Optional 32-bit Packages for Linux x86_64 .deb/.rpm

These packages provide 32-bit driver libraries needed for things such as Steam (popular game app store/launcher), older video games, and some compute applications.

**For Debian 11:**

```
sudo dpkg --add-architecture i386
sudo apt-get update
sudo apt-get install libcuda1-i386 nvidia-driver-libs-i386
```

**For Ubuntu:**

```
sudo dpkg --add-architecture i386
sudo apt-get update
sudo apt-get install libnvidia-compute-<branch>:i386 libnvidia-decode-<branch>:i386 \
  libnvidia-encode-<branch>:i386 libnvidia-extra-<branch>:i386 libnvidia-fbc1- \
  <branch>:i386 \n  libnvidia-gl-<branch>:i386
```

Where `<branch>` is the driver version, for example 495.

**For Fedora and RHEL8:**

```
sudo dnf install nvidia-driver-cuda-libs.i686 nvidia-driver-devel.i686 \n  nvidia-driver-libs.i686 nvidia-driver-NvFBCOpenGL.i686 nvidia-driver-NVML.i686
```

**Note:** There is no modularity profile support.

**For openSUSE/SLES:**

No extra installation is required, the `nvidia-glGO5` package already contains the 32-bit libraries.

3.10.3. Package Upgrades

The `cuda` package points to the latest stable release of the CUDA Toolkit. When a new version is available, use the following commands to upgrade the toolkit and driver:

```
sudo yum install cuda # RHEL7
```

```
sudo dnf upgrade cuda # Fedora/RHEL8
```

```
sudo zypper install cuda # OpenSUSE & SLES
```

```
sudo apt-get install cuda # Ubuntu
```

The `cuda-cross-<arch>` packages can also be upgraded in the same manner.
The cuda-drivers package points to the latest driver release available in the CUDA repository. When a new version is available, use the following commands to upgrade the driver:

```bash
sudo yum install nvidia-driver-latest-dkms                   # RHEL7
sudo yum install cuda-drivers                                # RHEL7
sudo dnf module update nvidia-driver:latest-dkms             # RHEL8/Fedora
sudo zypper install cuda-drivers nvidia-gfxG04-kmp-default   # OpenSUSE & SLES
sudo apt-get install cuda-drivers                            # Ubuntu
```

Some desktop environments, such as GNOME or KDE, will display an notification alert when new packages are available.

To avoid any automatic upgrade, and lock down the toolkit installation to the X.Y release, install the `cuda-X-Y` or `cuda-cross-<arch>-X-Y` package.

Side-by-side installations are supported. For instance, to install both the X.Y CUDA Toolkit and the X.Y+1 CUDA Toolkit, install the `cuda-X.Y` and `cuda-X.Y+1` packages.

### 3.10.4. Meta Packages

Meta packages are RPM/Deb/Conda packages which contain no (or few) files but have multiple dependencies. They are used to install many CUDA packages when you may not know the details of the packages you want. Below is the list of meta packages.

<table>
<thead>
<tr>
<th>Meta Package</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>cuda</td>
<td>Installs all CUDA Toolkit and Driver packages. Handles upgrading to the next version of the <code>cuda</code> package when it’s released.</td>
</tr>
<tr>
<td>cuda-11-5</td>
<td>Installs all CUDA Toolkit and Driver packages. Remains at version 11.5 until an additional version of CUDA is installed.</td>
</tr>
<tr>
<td>cuda-toolkit-11-5</td>
<td>Installs all CUDA Toolkit packages required to develop CUDA applications. Does not include the driver.</td>
</tr>
<tr>
<td>cuda-tools-11-5</td>
<td>Installs all CUDA command line and visual tools.</td>
</tr>
<tr>
<td>cuda-runtime-11-5</td>
<td>Installs all CUDA Toolkit packages required to run CUDA applications, as well as the Driver packages.</td>
</tr>
<tr>
<td>cuda-compiler-11-5</td>
<td>Installs all CUDA compiler packages.</td>
</tr>
<tr>
<td>cuda-libraries-11-5</td>
<td>Installs all runtime CUDA Library packages.</td>
</tr>
<tr>
<td>cuda-libraries-dev-11-5</td>
<td>Installs all development CUDA Library packages.</td>
</tr>
<tr>
<td>Meta Package</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cuda-drivers</td>
<td>Installs all Driver packages. Handles upgrading to the next version of the Driver packages when they’re released.</td>
</tr>
</tbody>
</table>
Chapter 4. Driver Installation

This section is for users who want to install a specific driver version.

For Debian and Ubuntu:

```
sudo apt-get install cuda-drivers-<branch>
```

For example:

```
sudo apt-get install cuda-drivers-418
```

For OpenSUSE and SLES:

```
sudo zypper install cuda-drivers-<branch>
```

For example:

```
sudo zypper install cuda-drivers-450
```

This allows you to get the highest version in the specified branch.

For Fedora and RHEL8:

```
sudo dnf module install nvidia-driver:<stream>/<profile>
```

where profile by default is "default" and does not need to be specified.

- Example dkms streams: 450-dkms or latest-dkms
- Example precompiled streams: 450 or latest

**Note:** Precompiled streams are only supported on RHEL8 x86_64.

To uninstall or change streams on Fedora and RHEL8:

```
sudo dnf remove nvidia-driver
sudo dnf module reset nvidia-driver
```
Chapter 5. Precompiled Streams

Precompiled streams offer an optional method of streamlining the installation process. The advantages of precompiled streams:

- Precompiled: faster boot up after driver and/or kernel updates
- Pre-tested: kernel and driver combination has been validated
- Removes gcc dependency: no compiler installation required
- Removes dkms dependency: enabling EPEL repository not required
- Removes kernel-devel and kernel-headers dependencies: no black screen if matching packages are missing

When using precompiled drivers, a plugin for the dnf package manager is enabled that cleans up stale .ko files. To prevent system breakages, the NVIDIA dnf plugin also prevents upgrading to a kernel for which no precompiled driver yet exists. This can delay the application of security fixes but ensures that a tested kernel and driver combination is always used. A warning is displayed by dnf during that upgrade situation:

```
NOTE: Skipping kernel installation since no NVIDIA driver kernel module package
kmod-nvidia-${driver}-${kernel} ... could be found
```

Packaging templates and instructions are provided on GitHub to allow you to maintain your own precompiled kernel module packages for custom kernels and derivative Linux distros: [NVIDIA/yum-packaging-precompiled-kmod](https://github.com/NVIDIA/yum-packaging-precompiled-kmod)

To use the new driver packages on RHEL 8:

1. First, ensure that the Red Hat repositories are enabled:
   ```
   subscription-manager repos --enable=rhel-8-for-x86_64-appstream-rpms
   subscription-manager repos --enable=rhel-8-for-x86_64-baseos-rpms
   ```

2. Choose **one** of the four options below depending on the desired driver:
   ```
   latest  always updates to the highest versioned driver (precompiled):
   sudo dnf module install nvidia-driver:latest
   ```
5.1. Precompiled Streams Support Matrix

This table shows the supported precompiled and legacy DKMS streams for each driver.

<table>
<thead>
<tr>
<th>NVIDIA Driver</th>
<th>Precompiled Stream</th>
<th>Legacy DKMS Stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>Highest version</td>
<td>latest</td>
<td>latest-dkms</td>
</tr>
<tr>
<td>Locked at 455.x</td>
<td>455</td>
<td>455-dkms</td>
</tr>
<tr>
<td>Locked at 450.x</td>
<td>450</td>
<td>450-dkms</td>
</tr>
<tr>
<td>Locked at 440.x</td>
<td>440</td>
<td>440-dkms</td>
</tr>
<tr>
<td>Locked at 418.x</td>
<td>418</td>
<td>418-dkms</td>
</tr>
</tbody>
</table>

5.2. Modularity Profiles

Modularity profiles work with any supported modularity stream and allow for additional use cases. These modularity profiles are available on RHEL8 and Fedora.

Table 5. List of nvidia-driver Module Profiles

<table>
<thead>
<tr>
<th>Stream</th>
<th>Profile</th>
<th>Use Case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>/default</td>
<td>Installs all the driver packages in a stream.</td>
</tr>
<tr>
<td>Kickstart</td>
<td>/ks</td>
<td>Performs unattended Linux OS installation using a config file.</td>
</tr>
</tbody>
</table>
Precompiled Streams

<table>
<thead>
<tr>
<th>Stream</th>
<th>Profile</th>
<th>Use Case</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVSwitch Fabric</td>
<td>/fm</td>
<td>Installs all the driver packages plus components required for bootstrapping an NVSwitch system (including the Fabric Manager and NSCQ telemetry).</td>
</tr>
<tr>
<td>Source</td>
<td>/src</td>
<td>Source headers for compilation (precompiled streams only).</td>
</tr>
</tbody>
</table>

For example:

```bash
sudo dnf module nvidia-driver:<stream>/default
sudo dnf module nvidia-driver:<stream>/ks
sudo dnf module nvidia-driver:<stream>/fm
sudo dnf module nvidia-driver:<stream>/src
```

You can install multiple modularity profiles using BASH curly brace expansion, for example:

```bash
sudo dnf module install nvidia-driver:latest/{default,src}
```

Chapter 6. Kickstart Installation

6.1. RHEL8/CentOS8

1. Enable the EPEL repository:

   ```
   repo --name=epel --baseurl=http://download.fedoraproject.org/pub/epel/8/Everything/x86_64/
   ```

2. Enable the CUDA repository:

   ```
   ```

3. In the packages section of the `ks.cfg` file, make sure you are using the `/ks` profile and 
   `.latest-dkms` stream:

   ```
   @nvidia-driver:latest-dkms/ks
   ```

4. Perform the `post-installation actions`. 

Chapter 7. Runfile Installation

Basic instructions can be found in the Quick Start Guide. Read on for more detailed instructions.

This section describes the installation and configuration of CUDA when using the standalone installer. The standalone installer is a “.run” file and is completely self-contained.

7.1. Overview

The Runfile installation installs the NVIDIA Driver, CUDA Toolkit, and CUDA Samples via an interactive ncurses-based interface.

The installation steps are listed below. Distribution-specific instructions on disabling the Nouveau drivers as well as steps for verifying device node creation are also provided.

Finally, advanced options for the installer and uninstallation steps are detailed below.

The Runfile installation does not include support for cross-platform development. For cross-platform development, see the CUDA Cross-Platform Environment section.

7.2. Installation

1. Perform the pre-installation actions.

2. Disable the Nouveau drivers.

3. Reboot into text mode [runlevel 3].

   This can usually be accomplished by adding the number “3” to the end of the system’s kernel boot parameters.

   Since the NVIDIA drivers are not yet installed, the text terminals may not display correctly. Temporarily adding “nomodeset” to the system’s kernel boot parameters may fix this issue.

   Consult your system’s bootloader documentation for information on how to make the above boot parameter changes.

   The reboot is required to completely unload the Nouveau drivers and prevent the graphical interface from loading. The CUDA driver cannot be installed while the Nouveau drivers are loaded or while the graphical interface is active.
4. Verify that the Nouveau drivers are not loaded. If the Nouveau drivers are still loaded, consult your distribution’s documentation to see if further steps are needed to disable Nouveau.

5. Run the installer and follow the on-screen prompts:

   ```
   sudo sh cuda_<version>_linux.run
   ```

   The installer will prompt for the following:
   - EULA Acceptance
   - CUDA Driver installation
   - CUDA Toolkit installation, location, and /usr/local/cuda symbolic link
   - CUDA Samples installation and location

   The default installation locations for the toolkit and samples are:

<table>
<thead>
<tr>
<th>Component</th>
<th>Default Installation Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA Toolkit</td>
<td>/usr/local/cuda-11.5</td>
</tr>
<tr>
<td>CUDA Samples</td>
<td>$(HOME)/NVIDIA_CUDA-11.5_Samples</td>
</tr>
</tbody>
</table>

   The /usr/local/cuda symbolic link points to the location where the CUDA Toolkit was installed. This link allows projects to use the latest CUDA Toolkit without any configuration file update.

   The installer must be executed with sufficient privileges to perform some actions. When the current privileges are insufficient to perform an action, the installer will ask for the user’s password to attempt to install with root privileges. Actions that cause the installer to attempt to install with root privileges are:
   - installing the CUDA Driver
   - installing the CUDA Toolkit to a location the user does not have permission to write to
   - installing the CUDA Samples to a location the user does not have permission to write to
   - creating the /usr/local/cuda symbolic link

   Running the installer with `sudo`, as shown above, will give permission to install to directories that require root permissions. Directories and files created while running the installer with `sudo` will have root ownership.

   If installing the driver, the installer will also ask if the openGL libraries should be installed. If the GPU used for display is not an NVIDIA GPU, the NVIDIA openGL libraries should not be installed. Otherwise, the openGL libraries used by the graphics driver of the non-NVIDIA GPU will be overwritten and the GUI will not work. If performing a silent installation, the `--no-opengl-libs` option should be used to prevent the openGL libraries from being installed. See the Advanced Options section for more details.

   If the GPU used for display is an NVIDIA GPU, the X server configuration file, `/etc/X11/xorg.conf`, may need to be modified. In some cases, `nvidia-xconfig` can be used to
automatically generate a `xorg.conf` file that works for the system. For non-standard systems, such as those with more than one GPU, it is recommended to manually edit the `xorg.conf` file. Consult the `xorg.conf` documentation for more information.

**Note:** Installing Mesa may overwrite the `/usr/lib/libGL.so` that was previously installed by the NVIDIA driver, so a reinstallation of the NVIDIA driver might be required after installing these libraries.

6. Reboot the system to reload the graphical interface.
7. Verify the device nodes are created properly.
8. Perform the post-installation actions.

### 7.3. Disabling Nouveau

To install the Display Driver, the Nouveau drivers must first be disabled. Each distribution of Linux has a different method for disabling Nouveau.

The Nouveau drivers are loaded if the following command prints anything:

```bash
lsmod | grep nouveau
```

#### 7.3.1. Fedora

1. Create a file at `/usr/lib/modprobe.d/blacklist-nouveau.conf` with the following contents:

   ```
   blacklist nouveau
   options nouveau modeset=0
   ```

2. Regenerate the kernel initramfs:

   ```bash
   sudo dracut --force
   ```

3. Run the following command:

   ```bash
   sudo grub2-mkconfig -o /boot/grub2/grub.cfg
   ```

4. Reboot the system.

#### 7.3.2. RHEL/CentOS

1. Create a file at `/etc/modprobe.d/blacklist-nouveau.conf` with the following contents:

   ```
   blacklist nouveau
   options nouveau modeset=0
   ```

2. Regenerate the kernel initramfs:

   ```bash
   sudo dracut --force
   ```
7.3.3. OpenSUSE

1. Create a file at `/etc/modprobe.d/blacklist-nouveau.conf` with the following contents:

   ```
   blacklist nouveau
   options nouveau modeset=0
   ```

2. Regenerate the kernel initrd:

   ```
   sudo /sbin/mkinitrd
   ```

7.3.4. SLES

No actions to disable Nouveau are required as Nouveau is not installed on SLES.

7.3.5. WSL

No actions to disable Nouveau are required as Nouveau is not installed on WSL.

7.3.6. Ubuntu

1. Create a file at `/etc/modprobe.d/blacklist-nouveau.conf` with the following contents:

   ```
   blacklist nouveau
   options nouveau modeset=0
   ```

2. Regenerate the kernel initramfs:

   ```
   sudo update-initramfs -u
   ```

7.3.7. Debian

1. Create a file at `/etc/modprobe.d/blacklist-nouveau.conf` with the following contents:

   ```
   blacklist nouveau
   options nouveau modeset=0
   ```

2. Regenerate the kernel initramfs:

   ```
   sudo update-initramfs -u
   ```

7.4. Device Node Verification

Check that the device files `/dev/nvidia*` exist and have the correct (0666) file permissions. These files are used by the CUDA Driver to communicate with the kernel-mode portion of the NVIDIA Driver. Applications that use the NVIDIA driver, such as a CUDA application or the X server (if any), will normally automatically create these files if they are missing using the `setuid nvidia-modprobe` tool that is bundled with the NVIDIA Driver. However, some systems
disallow setuid binaries, so if these files do not exist, you can create them manually by using a startup script such as the one below:

```bash
#!/bin/bash
/sbin/modprobe nvidia

if [ "$?" -eq 0 ]; then
    # Count the number of NVIDIA controllers found.
    NVDEVS='lspci | grep -i NVIDIA'
    N3D=`echo "$NVDEVS" | grep "3D controller" | wc -l`
    NVGA=`echo "$NVDEVS" | grep "VGA compatible controller" | wc -l`
    N=`expr $N3D + $NVGA - 1`
    for i in `seq 0 $N`; do
        mknod -m 666 /dev/nvidia$i c 195 $i
    done
    mknod -m 666 /dev/nvidiactl c 195 255
else
    exit 1
fi

/sbin/modprobe nvidia-uvm

if [ "$?" -eq 0 ]; then
    # Find out the major device number used by the nvidia-uvm driver
    D=`grep nvidia-uvm /proc/devices | awk '{print $1}'`
    mknod -m 666 /dev/nvidia-uvm c $D 0
else
    exit 1
fi
```

### 7.5. Advanced Options

<table>
<thead>
<tr>
<th>Action</th>
<th>Options Used</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silent Installation</td>
<td>--silent</td>
<td>Required for any silent installation. Performs an installation with no further user-input and minimal command-line output based on the options provided below. Silent installations are useful for scripting the installation of CUDA. Using this option implies acceptance of the EULA. The following flags can be used to customize the actions taken during installation. At least one of --driver, --uninstall, --toolkit, and --samples must be passed if running with non-root permissions.</td>
</tr>
<tr>
<td></td>
<td>--driver</td>
<td>Install the CUDA Driver.</td>
</tr>
<tr>
<td></td>
<td>--toolkit</td>
<td>Install the CUDA Toolkit.</td>
</tr>
<tr>
<td></td>
<td>--toolkitpath=&lt;path&gt;</td>
<td>Install the CUDA Toolkit to the &lt;path&gt; directory. If not provided, the default path of /usr/local/cuda-11.5 is used.</td>
</tr>
<tr>
<td></td>
<td>--samples</td>
<td>Install the CUDA Samples.</td>

### Runfile Installation

#### NVIDIA CUDA Installation Guide for Linux

<table>
<thead>
<tr>
<th>Action</th>
<th>Options Used</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong></td>
<td><strong>Options Used</strong></td>
<td><strong>Explanation</strong></td>
</tr>
<tr>
<td>--samplespath=&lt;path&gt;</td>
<td>Install the CUDA Samples to the &lt;path&gt; directory. If not provided, the default path of $ (HOME) / NVIDIA_CUDA-11.5_Samples is used.</td>
<td></td>
</tr>
<tr>
<td>--defaultroot=&lt;path&gt;</td>
<td>Install libraries to the &lt;path&gt; directory. If the &lt;path&gt; is not provided, then the default path of your distribution is used. <em>This only applies to the libraries installed outside of the CUDA Toolkit path.</em></td>
<td></td>
</tr>
<tr>
<td>Extraction</td>
<td>--extract=&lt;path&gt;</td>
<td>Extracts to the &lt;path&gt; the following: the driver runfile, the raw files of the toolkit and samples to &lt;path&gt;. This is especially useful when one wants to install the driver using one or more of the command-line options provided by the driver installer which are not exposed in this installer.</td>
</tr>
<tr>
<td>Overriding Installation Checks</td>
<td>--override</td>
<td>Ignores compiler, third-party library, and toolkit detection checks which would prevent the CUDA Toolkit and CUDA Samples from installing.</td>
</tr>
<tr>
<td>No OpenGL Libraries</td>
<td>--no-opengl-libs</td>
<td>Prevents the driver installation from installing NVIDIA's GL libraries. Useful for systems where the display is driven by a non-NVIDIA GPU. In such systems, NVIDIA's GL libraries could prevent X from loading properly.</td>
</tr>
<tr>
<td>No man pages</td>
<td>--no-man-page</td>
<td>Do not install the man pages under /usr/share/man.</td>
</tr>
<tr>
<td>Overriding Kernel Source</td>
<td>--kernel-source-path=&lt;path&gt;</td>
<td>Tells the driver installation to use &lt;path&gt; as the kernel source directory when building the NVIDIA kernel module. Required for systems where the kernel source is installed to a non-standard location.</td>
</tr>
<tr>
<td>Running nvidia-xconfig</td>
<td>--run-nvidia-xconfig</td>
<td>Tells the driver installation to run nvidia-xconfig to update the system X configuration file so that the NVIDIA X driver is used. The pre-existing X configuration file will be backed up.</td>
</tr>
<tr>
<td>No nvidia-drm kernel module</td>
<td>--no-drm</td>
<td>Do not install the nvidia-drm kernel module. This option should only be used to work around failures to build or install the nvidia-drm kernel module on systems that do not need the provided features.</td>
</tr>
<tr>
<td>Custom Temporary Directory Selection</td>
<td>--tmpdir=&lt;path&gt;</td>
<td>Performs any temporary actions within &lt;path&gt; instead of /tmp. Useful in cases where /tmp cannot be used (doesn’t exist, is full, is mounted with ‘noexec’, etc.).</td>
</tr>
<tr>
<td>Show Installer Options</td>
<td>--help</td>
<td>Prints the list of command-line options to stdout.</td>
</tr>
</tbody>
</table>
7.6. Uninstallation

To uninstall the CUDA Toolkit, run the uninstallation script provided in the bin directory of the toolkit. By default, it is located in `/usr/local/cuda-11.5/bin`:

```
sudo /usr/local/cuda-11.5/bin/cuda-uninstaller
```

To uninstall the NVIDIA Driver, run `nvidia-uninstall`:

```
sudo /usr/bin/nvidia-uninstall
```

To enable the Nouveau drivers, remove the blacklist file created in the Disabling Nouveau section, and regenerate the kernel initramfs/initrd again as described in that section.
Chapter 8. Conda Installation

This section describes the installation and configuration of CUDA when using the Conda installer. The Conda packages are available at https://anaconda.org/nvidia.

8.1. Conda Overview

The Conda installation installs the CUDA Toolkit and CUDA Samples. The installation steps are listed below.

8.2. Installation

To perform a basic install of all CUDA Toolkit components using Conda, run the following command:

conda install cuda -c nvidia

8.3. Uninstallation

To uninstall the CUDA Toolkit using Conda, run the following command:

conda remove cuda

8.4. Installing Previous CUDA Releases

All Conda packages released under a specific CUDA version are labeled with that release version. To install a previous version, include that label in the install command such as:

conda install cuda -c nvidia/label/cuda-11.3.0

Note:

Some CUDA releases do not move to new versions of all installable components. When this is the case these components will be moved to the new label, and you may need to modify the install command to include both labels such as:

conda install cuda -c nvidia/label/cuda-11.3.0 -c nvidia/label/cuda-11.3.1
This example will install all packages released as part of CUDA 11.3.0.
NVIDIA provides Python Wheels for installing CUDA through pip, primarily for using CUDA with Python. These packages are intended for runtime use and do not currently include developer tools (these can be installed separately).

Please note that with this installation method, CUDA installation environment is managed via pip and additional care must be taken to set up your host environment to use CUDA outside the pip environment.

Prerequisites

To install Wheels, you must first install the nvidia-pyindex package, which is required in order to set up your pip installation to fetch additional Python modules from the NVIDIA NGC PyPI repo. If your pip and setuptools Python modules are not up-to-date, then use the following command to upgrade these Python modules. If these Python modules are out-of-date then the commands which follow later in this section may fail.

```bash
python3 -m pip install --upgrade setuptools pip wheel
```

You should now be able to install the nvidia-pyindex module.

```bash
python3 -m pip install nvidia-pyindex
```

If your project is using a requirements.txt file, then you can add the following line to your requirements.txt file as an alternative to installing the nvidia-pyindex package:

```
--extra-index-url https://pypi.ngc.nvidia.com
```

Procedure

Install the CUDA runtime package:

```bash
python3 -m pip install nvidia-cuda-runtime-cu11
```

Optionally, install additional packages as listed below using the following command:

```bash
python3 -m pip install nvidia-<library>
```

Metapackages

The following metapackages will install the latest version of the named component on Linux for the indicated CUDA version. “cu11” should be read as “cuda11”.

- nvidia-cuda-runtime-cu11
- nvidia-cuda-cupti-cu11
- nvidia-cuda-nvcc-cu11
- nvidia-nvml-dev-cu11
- nvidia-cuda-nvrtc-cu11
- nvidia-nvtx-cu11
- nvidia-cuda-sanitizer-api-cu11
- nvidia-cublas-cu11
- nvidia-cufft-cu11
- nvidia-curand-cu11
- nvidia-cusolver-cu11
- nvidia-cusparse-cu11
- nvidia-npp-cu11
- nvidia-nvjpeg-cu11

These metapackages install the following packages:
- nvidia-nvml-dev-cu114
- nvidia-cuda-nvcc-cu114
- nvidia-cuda-runtime-cu114
- nvidia-cuda-cupti-cu114
- nvidia-cublas-cu114
- nvidia-cuda-sanitizer-api-cu114
- nvidia-nvtx-cu114
- nvidia-cuda-nvrtc-cu114
- nvidia-npp-cu114
- nvidia-cusparse-cu114
- nvidia-cusolver-cu114
- nvidia-curand-cu114
- nvidia-cufft-cu114
- nvidia-nvjpeg-cu114
Chapter 10. Tarball and Zip Archive Deliverables

In an effort to meet the needs of a growing customer base requiring alternative installer packaging formats, as well as a means of input into community CI/CD systems, tarball and zip archives for each component. These tarball and zip archives are provided at https://developer.download.nvidia.com/compute/cuda/redist/.

These .tar.xz and .zip archives do not replace existing packages such as .deb, .rpm, runfile, conda, etc. and are not meant for general consumption, as they are not installers. However this standardized approach will replace existing .txz archives.

For each release, a JSON manifest is provided such as redistrib_11.4.2.json, which corresponds to the CUDA 11.4.2 release label (CUDA 11.4 update 2) which includes the release date, the name of each component, license name, relative URL for each platform and checksums.

Package maintainers are advised to check the provided LICENSE for each component prior to redistribution. Instructions for developers using CMake and Bazel build systems are provided in the next sections.
10.1. Parsing Redist JSON

The following example of a JSON manifest contains keys for each component: name, license, version, and a platform array which includes relative_path, sha256, md5, and size [bytes] for each archive.

```json
{
    "release_date": "2021-09-07",
    "cuda_cudart": {
        "name": "CUDA Runtime (cudart)",
        "license": "CUDA Toolkit",
        "version": "11.4.108",
        "linux-x86_64": {
            "relative_path": "cuda_cudart/linux-x86_64/cuda_cudart-linux-x86_64-11.4.108-archive.tar.xz",
            "sha256": "d08a1b731e5175aa3ae06a6d1c6b3059dd9ea13836d947018ea5e3ec2ca3d62b",
            "md5": "da198656b27a3559004c3b7f20e5d074",
            "size": "828300"
        },
        "linux-ppc64le": {
            "relative_path": "cuda_cudart/linux-ppc64le/cuda_cudart-linux-ppc64le-11.4.108-archive.tar.xz",
            "sha256": "831dffe062ae3ebda3d3c4010d0ee4e40a01fd5e6358098a87bb318ea7c79e0c",
            "md5": "ca73328e3f8e2bb5b1f2184c98c3a510",
            "size": "776840"
        },
        "linux-sbsa": {
            "relative_path": "cuda_cudart/linux-sbsa/cuda_cudart-linux-sbsa-11.4.108-archive.tar.xz",
            "sha256": "2ab9599bbabe0bdf59add73d1fla352ae619f8cb5ccec254093c98ed4c14553c",
            "md5": "ae05c19661f06b6398741015ba368102",
            "size": "782372"
        },
        "windows-x86_64": {
            "relative_path": "cuda_cudart/windows-x86_64/cuda_cudart-windows-x86_64-11.4.108-archive.zip",
            "sha256": "b59756c27658d1e8a7a17c06d064d1336576431cd64da5d1790d909e45506d3",
            "md5": "7f6837a46b78198402429a3760ab28fc",
            "size": "2897751"
        }
    }
}
```

A JSON schema is provided at https://developer.download.nvidia.com/compute/redist/redist-v2.schema.json.

A sample script that parses these JSON manifests is available on GitHub:

- Downloads each archive
- Validates SHA256 checksums
- Extracts archives
- Flattens into a collapsed directory structure
10.2. Importing Tarballs into CMake

The recommended module for importing these tarballs into the CMake build system is via FindCUDAToolkit (3.17 and newer).

Note: The FindCUDA module is deprecated.

The path to the extraction location can be specified with the CUDAToolkit_ROOT environmental variable. For example CMakeLists.txt and commands, see cmake/1_FindCUDAToolkit/.

For older versions of CMake, the ExternalProject_Add module is an alternative method. For example CMakeLists.txt file and commands, see cmake/2_ExternalProject/.

10.3. Importing Tarballs into Bazel

The recommended method of importing these tarballs into the Bazel build system is using http_archive and pkg_tar.

For an example, see bazel/1_pkg_tar/.
Cross-platform development is only supported on Ubuntu systems, and is only provided via the Package Manager installation process.

We recommend selecting Ubuntu 18.04 as your cross-platform development environment. This selection helps prevent host/target incompatibilities, such as GCC or GLIBC version mismatches.

### 11.1. CUDA Cross-Platform Installation

Some of the following steps may have already been performed as part of the native Ubuntu installation. Such steps can safely be skipped.

These steps should be performed on the x86_64 host system, rather than the target system. To install the native CUDA Toolkit on the target system, refer to the native Ubuntu installation section.

1. Perform the pre-installation actions.
2. Install repository meta-data package with:

   ```
   sudo dpkg -i cuda-repo-cross-<identifier>_all.deb
   ```

   where `<identifier>` indicates the operating system, architecture, and/or the version of the package.

3. Update the Apt repository cache:

   ```
   sudo apt-get update
   ```

4. Install the appropriate cross-platform CUDA Toolkit:

   a). For aarch64:

   ```
   sudo apt-get install cuda-cross-aarch64
   ```

   b). For QNX:

   ```
   sudo apt-get install cuda-cross-qnx
   ```

5. Perform the post-installation actions.
11.2. CUDA Cross-Platform Samples

This section describes the options used to build cross-platform samples. `TARGET_ARCH=<arch>` and `TARGET_OS=<os>` should be chosen based on the supported targets shown below. `TARGET_FS=<path>` can be used to point nvcc to libraries and headers used by the sample.

Table 6. Supported Target Arch/OS Combinations

<table>
<thead>
<tr>
<th>TARGET ARCH</th>
<th>linux</th>
<th>android</th>
<th>qnx</th>
</tr>
</thead>
<tbody>
<tr>
<td>x86_64</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
</tr>
<tr>
<td>aarch64</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>sbsa</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
</tr>
</tbody>
</table>

**TARGET_ARCH**

The target architecture must be specified when cross-compiling applications. If not specified, it defaults to the host architecture. Allowed architectures are:

- x86_64 - 64-bit x86 CPU architecture
- aarch64 - 64-bit ARM CPU architecture, like that found on Jetson TX1 onwards
- sbsa - 64-bit ARM Server CPU architecture

**TARGET_OS**

The target OS must be specified when cross-compiling applications. If not specified, it defaults to the host OS. Allowed OSes are:

- linux - for any Linux distributions
- android - for any supported device running Android
- qnx - for any supported device running QNX

**TARGET_FS**

The most reliable method to cross-compile the CUDA Samples is to use the `TARGET_FS` variable. To do so, mount the target’s filesystem on the host, say at `/mnt/target`. This is typically done using `exportfs`. In cases where `exportfs` is unavailable, it is sufficient to copy the target’s filesystem to `/mnt/target`. To cross-compile a sample, execute:

```
make TARGET_ARCH=<arch> TARGET_OS=<os> TARGET_FS=/mnt/target
```
Cross Compiling to Embedded ARM architectures

While cross compiling the samples from x86_64 installation to embedded ARM architectures, that is, aarch64 or armv7l, if you intend to run the executable on tegra GPU then SMS variable need to override SM architectures to the Tegra GPU through $SMS=<TEGRA_GPU_SM_ARCH>$, where $<TEGRA_GPU_SM_ARCH>$ is the SM architecture of Tegra GPU on which you want the generated binary to run on. For instance it can be $SMS="53 62 72"$. Note you can also add SM arch of discrete GPU to this list $<TEGRA_GPU_SM_ARCH>$ if you intend to run on embedded board having discrete GPU as well. To cross compile a sample, execute:

```
make TARGET_ARCH=<arch> TARGET_OS=<os> SMS=<TEGRA_GPU_SM_ARCHS> TARGET_FS=/mnt/target
```

Copying Libraries

If the TARGET_FS option is not available, the libraries used should be copied from the target system to the host system, say at /opt/target/libs. If the sample uses GL, the GL headers must also be copied, say at /opt/target/include. The linker must then be told where the libraries are with the -rpath-link and/or -L options. To ignore unresolved symbols from some libraries, use the --unresolved-symbols option as shown below. SAMPLE_ENABLED should be used to force the sample to build. For example, to cross-compile a sample which uses such libraries, execute:

```
make TARGET_ARCH=<arch> TARGET_OS=<os> \
EXTRA_LDFLAGS="-rpath-link=/opt/target/libs -L/opt/target/libs --unresolved-symbols=ignore-in-shared-libs" \
EXTRA_CFLAGS="-I /opt/target/include" \
SAMPLE_ENABLED=1
```
Chapter 12. Post-installation Actions

The post-installation actions must be manually performed. These actions are split into mandatory, recommended, and optional sections.

12.1. Mandatory Actions

Some actions must be taken after the installation before the CUDA Toolkit and Driver can be used.

12.1.1. Environment Setup

The `PATH` variable needs to include $ export PATH=/usr/local/cuda-11.5/bin${PATH: +:$PATH}. Nsight Compute has moved to /opt/nvidia/nsight-compute/ only in rpm/deb installation method. When using .run installer it is still located under /usr/local/cuda-11.5/.

To add this path to the `PATH` variable:

```
export PATH=/usr/local/cuda-11.5/bin${PATH:+:${PATH}}
```

In addition, when using the runfile installation method, the `LD_LIBRARY_PATH` variable needs to contain /usr/local/cuda-11.5/lib64 on a 64-bit system, or /usr/local/cuda-11.5/lib on a 32-bit system

- To change the environment variables for 64-bit operating systems:
  
  ```
  export LD_LIBRARY_PATH=/usr/local/cuda-11.5/lib64\ 
  ${LD_LIBRARY_PATH:+:${LD_LIBRARY_PATH}}
  ```

- To change the environment variables for 32-bit operating systems:
  
  ```
  export LD_LIBRARY_PATH=/usr/local/cuda-11.5/lib\ 
  ${LD_LIBRARY_PATH:+:${LD_LIBRARY_PATH}}
  ```

Note that the above paths change when using a custom install path with the runfile installation method.

12.1.2. POWER9 Setup

Because of the addition of new features specific to the NVIDIA POWER9 CUDA driver, there are some additional setup requirements in order for the driver to function properly. These
additional steps are not handled by the installation of CUDA packages, and failure to ensure these extra requirements are met will result in a non-functional CUDA driver installation.

There are two changes that need to be made manually after installing the NVIDIA CUDA driver to ensure proper operation:

1. The NVIDIA Persistence Daemon should be automatically started for POWER9 installations. Check that it is running with the following command:

```
 systemctl status nvidia-persistenced
```

If it is not active, run the following command:

```
 sudo systemctl enable nvidia-persistenced
```

2. Disable a udev rule installed by default in some Linux distributions that cause hot-pluggable memory to be automatically onlined when it is physically probed. This behavior prevents NVIDIA software from bringing NVIDIA device memory online with non-default settings. This udev rule must be disabled in order for the NVIDIA CUDA driver to function properly on POWER9 systems.

On RedHat Enterprise Linux 8.1, this rule can be found in:

```
 /lib/udev/rules.d/40-redhat.rules
```

On Ubuntu 18.04, this rule can be found in:

```
 /lib/udev/rules.d/40-vm-hotadd.rules
```

The rule generally takes a form where it detects the addition of a memory block and changes the 'state' attribute to online. For example, in RHEL8, the rule looks like this:

```
 SUBSYSTEM=="memory", ACTION=="add", PROGRAM="/bin/uname -p", RESULT!="s390*", ATTR(state)=="offline", ATTR(state)=="online"
```

This rule must be disabled by copying the file to `/etc/udev/rules.d` and commenting out, removing, or changing the hot-pluggable memory rule in the `/etc` copy so that it does not apply to POWER9 NVIDIA systems. For example, on RHEL 7.5 and earlier:

```
 sudo cp /lib/udev/rules.d/40-redhat.rules /etc/udev/rules.d
 sudo sed -i '/SUBSYSTEM=="memory", ACTION=="add"/d' /etc/udev/rules.d/40-redhat.rules
```

On RHEL 7.6 and later versions:

```
 sudo cp /lib/udev/rules.d/40-redhat.rules /etc/udev/rules.d
 sudo sed -i 's/SUBSYSTEM=="memory",.*GOTO="memory_hotplug_end"/SUBSYSTEM=="", GOTO="memory_hotplug_end"/ /etc/udev/rules.d/40-redhat.rules
```

You will need to reboot the system to initialize the above changes.

**Note:** For NUMA best practices on IBM Newell POWER9, see [NUMA Best Practices](#).
12.2. Recommended Actions

Other actions are recommended to verify the integrity of the installation.

12.2.1. Install Persistence Daemon

NVIDIA is providing a user-space daemon on Linux to support persistence of driver state across CUDA job runs. The daemon approach provides a more elegant and robust solution to this problem than persistence mode. For more details on the NVIDIA Persistence Daemon, see the documentation [here](#).

The NVIDIA Persistence Daemon can be started as the root user by running:

```
/usr/bin/nvidia-persistenced --verbose
```

This command should be run on boot. Consult your Linux distribution’s init documentation for details on how to automate this.

12.2.2. Install Writable Samples

In order to modify, compile, and run the samples, the samples must be installed with write permissions. A convenience installation script is provided:

```
cuda-install-samples-11.5.sh <dir>
```

This script is installed with the `cuda-samples-11-5` package. The `cuda-samples-11-5` package installs only a read-only copy in `/usr/local/cuda-11.5/samples`.

12.2.3. Verify the Installation

Before continuing, it is important to verify that the CUDA toolkit can find and communicate correctly with the CUDA-capable hardware. To do this, you need to compile and run some of the included sample programs.

**Note:** Ensure the PATH and, if using the runfile installation method, LD_LIBRARY_PATH variables are set correctly.

12.2.3.1. Verify the Driver Version

If you installed the driver, verify that the correct version of it is loaded. If you did not install the driver, or are using an operating system where the driver is not loaded via a kernel module, such as L4T, skip this step.

When the driver is loaded, the driver version can be found by executing the command

```
cat /proc/driver/nvidia/version
```

Note that this command will not work on an iGPU/dGPU system.
12.2.3.2. Compiling the Examples

The version of the CUDA Toolkit can be checked by running `nvcc -V` in a terminal window. The `nvcc` command runs the compiler driver that compiles CUDA programs. It calls the `gcc` compiler for C code and the NVIDIA PTX compiler for the CUDA code.

The NVIDIA CUDA Toolkit includes sample programs in source form. You should compile them by changing to `~/NVIDIA_CUDA-11.5_Samples` and typing `make`. The resulting binaries will be placed under `~/NVIDIA_CUDA-11.5_Samples/bin`.

12.2.3.3. Running the Binaries

After compilation, find and run `deviceQuery` under `~/NVIDIA_CUDA-11.5_Samples`. If the CUDA software is installed and configured correctly, the output for `deviceQuery` should look similar to that shown in Figure 1.

**Figure 1. Valid Results from deviceQuery CUDA Sample**

![deviceQuery Output](image)

The exact appearance and the output lines might be different on your system. The important outcomes are that a device was found (the first highlighted line), that the device matches the one on your system (the second highlighted line), and that the test passed (the final highlighted line).
If a CUDA-capable device and the CUDA Driver are installed but `deviceQuery` reports that no CUDA-capable devices are present, this likely means that the `/dev/nvidia*` files are missing or have the wrong permissions.

On systems where SELinux is enabled, you might need to temporarily disable this security feature to run `deviceQuery`. To do this, type:

```
setenforce 0
```

from the command line as the `superuser`.

Running the `bandwidthTest` program ensures that the system and the CUDA-capable device are able to communicate correctly. Its output is shown in Figure 2.

**Figure 2.** Valid Results from bandwidthTest CUDA Sample

![BandwidthTest Result](image)

Note that the measurements for your CUDA-capable device description will vary from system to system. The important point is that you obtain measurements, and that the second-to-last line (in Figure 2) confirms that all necessary tests passed.

Should the tests not pass, make sure you have a CUDA-capable NVIDIA GPU on your system and make sure it is properly installed.

If you run into difficulties with the link step (such as libraries not being found), consult the `Linux Release Notes` found in the `doc` folder in the CUDA Samples directory.
12.2.4. **Install Nsight Eclipse Plugins**

To install Nsight Eclipse plugins, an installation script is provided:

```
/usr/local/cuda-11.5/bin/nsight_ee_plugins_manage.sh install <eclipse-dir>
```

Refer to [Nsight Eclipse Plugins Installation Guide](#) for more details.

12.3. **Optional Actions**

Other options are not necessary to use the CUDA Toolkit, but are available to provide additional features.

12.3.1. **Install Third-party Libraries**

Some CUDA samples use third-party libraries which may not be installed by default on your system. These samples attempt to detect any required libraries when building.

If a library is not detected, it waive itself and warns you which library is missing. To build and run these samples, you must install the missing libraries. These dependencies may be installed if the RPM or Deb `cuda-samples-11-5` package is used. In cases where these dependencies are not installed, follow the instructions below.

**RHEL7/CentOS7**

```
sudo yum install freeglut-devel libX11-devel libXi-devel libXmu-devel \ make mesa-libGLU-devel freeimage-devel
```

**RHEL8/CentOS8**

```
sudo dnf install freeglut-devel libX11-devel libXi-devel libXmu-devel \ make mesa-libGLU-devel freeimage-devel
```

**Fedora**

```
sudo dnf install freeglut-devel libX11-devel libXi-devel libXmu-devel \ make mesa-libGLU-devel freeimage-devel
```

**SLES**

```
sudo zypper install libglut3 libX11 libXi6 libXmu6 libGLU1 make
```

**OpenSUSE**

```
sudo zypper install freeglut-devel libX11-devel libXi-devel libXmu-devel \ make Mesa-libGLU-devel freeimage-devel
```

**Ubuntu**

```
sudo apt-get install g++ freeglut3-dev build-essential libx11-dev \`
12.3.2. Install the Source Code for cuda-gdb

The cuda-gdb source must be explicitly selected for installation with the runfile installation method. During the installation, in the component selection page, expand the component “CUDA Tools 11.0” and select cuda-gdb-src for installation. It is unchecked by default.

To obtain a copy of the source code for cuda-gdb using the RPM and Debian installation methods, the cuda-gdb-src package must be installed.

The source code is installed as a tarball in the /usr/local/cuda-11.5/extras directory.

12.3.3. Select the Active Version of CUDA

For applications that rely on the symlinks /usr/local/cuda and /usr/local/cuda-MAJOR, you may wish to change to a different installed version of CUDA using the provided alternatives.

To show the active version of CUDA and all available versions:

```
update-alternatives --display cuda
```

To show the active minor version of a given major CUDA release:

```
update-alternatives --display cuda-11
```

To update the active version of CUDA:

```
sudo update-alternatives --config cuda
```
Chapter 13. Advanced Setup

Below is information on some advanced setup scenarios which are not covered in the basic instructions above.

Table 7. Advanced Setup Scenarios when Installing CUDA

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Instructions</th>
</tr>
</thead>
</table>
| Install CUDA using the Package Manager installation method without installing the NVIDIA GL libraries. | Fedora  
Install CUDA using the following command:  
```
sudo dnf install cuda-toolkit-11-5\n  nvidia-driver-cuda akmod-nvidia
```
Follow the instructions [here](#) to ensure that Nouveau is disabled.  
If performing an upgrade over a previous installation, the NVIDIA kernel module may need to be rebuilt by following the instructions [here](#).  
**OpenSUSE/SLES**  
On some system configurations the NVIDIA GL libraries may need to be locked before installation using:  
```
sudo zypper addlock nvidia-glG04
```
Install CUDA using the following command:  
```
sudo zypper install --no-recommends cuda-toolkit-11-5\n  nvidia-computeG04 \n  nvidia-gfxG04-kmp-default
```
Follow the instructions [here](#) to ensure that Nouveau is disabled.  
**Ubuntu**  
This functionality isn’t supported on Ubuntu. Instead, the driver packages integrate with the Bumblebee framework to provide a solution for users who wish to control what applications the NVIDIA drivers are used for. See Ubuntu’s [Bumblebee wiki](#) for more information.  
**Upgrade from a RPM/Deb driver installation which includes the diagnostic driver packages to a driver**  
**RHEL/CentOS**  
Remove diagnostic packages using the following command:  
```
sudo yum remove cuda-drivers-diagnostic \xorg-x11-driv-nvidia-diagnostic
```
### Scenario

<table>
<thead>
<tr>
<th>Installation which does not include the diagnostic driver packages.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the instructions <a href="#">here</a> to continue installation as normal.</td>
</tr>
<tr>
<td><strong>Fedora</strong></td>
</tr>
<tr>
<td>Remove diagnostic packages using the following command:</td>
</tr>
<tr>
<td><code>sudo dnf remove cuda-drivers-diagnostic \</code></td>
</tr>
<tr>
<td><code>xorg-x11-driv-nvidia-diagnostic</code></td>
</tr>
<tr>
<td>Follow the instructions <a href="#">here</a> to continue installation as normal.</td>
</tr>
<tr>
<td><strong>OpenSUSE/SLES</strong></td>
</tr>
<tr>
<td>Remove diagnostic packages using the following command:</td>
</tr>
<tr>
<td><code>sudo zypper remove cuda-drivers-diagnostic \</code></td>
</tr>
<tr>
<td><code>nvidia-diagnostic04</code></td>
</tr>
<tr>
<td>Follow the instructions <a href="#">here</a> to continue installation as normal.</td>
</tr>
<tr>
<td><strong>Ubuntu</strong></td>
</tr>
<tr>
<td>Remove diagnostic packages using the following command:</td>
</tr>
<tr>
<td><code>sudo apt-get purge cuda-drivers-diagnostic \</code></td>
</tr>
<tr>
<td><code>nvidia-384-diagnostic</code></td>
</tr>
<tr>
<td>Follow the instructions <a href="#">here</a> to continue installation as normal.</td>
</tr>
</tbody>
</table>

### Use a specific GPU for rendering the display.

<table>
<thead>
<tr>
<th>Add or replace a <strong>Device</strong> entry in your xorg.conf file, located at <code>/etc/X11/xorg.conf</code>. The <strong>Device</strong> entry should resemble the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Section &quot;Device&quot;</strong></td>
</tr>
<tr>
<td><strong>Identifier</strong></td>
</tr>
<tr>
<td><strong>EndSection</strong></td>
</tr>
<tr>
<td>The details will you will need to add differ on a case-by-case basis. For example, if you have two NVIDIA GPUs and you want the first GPU to be used for display, you would replace &quot;driver_name&quot; with &quot;nvidia&quot;, &quot;vendor_name&quot; with &quot;NVIDIA Corporation&quot; and &quot;bus_id&quot; with the Bus ID of the GPU.</td>
</tr>
<tr>
<td>The Bus ID will resemble “PCI:00:02.0” and can be found by running <code>lspci</code>.</td>
</tr>
</tbody>
</table>

### Install CUDA to a specific directory using the Package Manager installation method.

<table>
<thead>
<tr>
<th>RPM The RPM packages don’t support custom install locations through the package managers (Yum and Zypper), but it is possible to install the RPM packages to a custom location using rpm’s <code>--relocate</code> parameter:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sudo rpm --install --relocate /usr/local/cuda-11.5=/new/toolkit package.rpm</code></td>
</tr>
<tr>
<td>You will need to install the packages in the correct dependency order; this task is normally taken care of by the package managers. For example, if package &quot;foo&quot; has a dependency on package &quot;bar&quot;, you should install package &quot;bar&quot; first, and package &quot;foo&quot; second. You can check the dependencies of a RPM package as follows:</td>
</tr>
<tr>
<td><code>rpm -qRp package.rpm</code></td>
</tr>
<tr>
<td>Scenario</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>Note that the driver packages cannot be relocated. <strong>Deb</strong></td>
</tr>
<tr>
<td>Extract the contents of the installers. <strong>Runfile</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>RPM</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Deb</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Modify Ubuntu’s apt package manager to query specific architectures for specific repositories.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>The nvidia.ko kernel module fails to load, saying some symbols are unknown.</td>
</tr>
<tr>
<td>Scenario</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>For example: nvidia: Unknown symbol drm_open (err 0) instance, on Ubuntu 14.04, the linux-image-extra package provides the DRM kernel module (which provides drm_open). This package is optional even though the kernel headers reflect the availability of DRM regardless of whether this package is installed or not.</td>
</tr>
<tr>
<td>The runfile installer fails to extract due to limited space in the TMP directory. This can occur on systems with limited storage in the TMP directory (usually /tmp), or on systems which use a tmpfs in memory to handle temporary storage. In this case, the --tmpdir command-line option should be used to instruct the runfile to use a directory with sufficient space to extract into. More information on this option can be found here.</td>
</tr>
<tr>
<td>Re-enable Wayland after installing the RPM driver on Fedora. Wayland is disabled during installation of the Fedora driver RPM due to compatibility issues. To re-enable wayland, comment out this line in /etc/gdm/custom.conf: WaylandEnable=false</td>
</tr>
<tr>
<td>In case of the error: E: Failed to fetch file:/var/cuda-repo File not found Debian and Ubuntu This can occur when installing CUDA after uninstalling a different version. Use the following command before installation: sudo rm -v /var/lib/apt/lists/<em>cuda</em> /var/lib/apt/lists/<em>nvidia</em></td>
</tr>
</tbody>
</table>
Chapter 14. Frequently Asked Questions

How do I install the Toolkit in a different location?

The Runfile installation asks where you wish to install the Toolkit and the Samples during an interactive install. If installing using a non-interactive install, you can use the --toolkitpath and --samplespath parameters to change the install location:

```
./runfile.run --silent
   --toolkit --toolkitpath=/my/new/toolkit
   --samples --samplespath=/my/new/samples
```

The RPM and Deb packages cannot be installed to a custom install location directly using the package managers. See the “Install CUDA to a specific directory using the Package Manager installation method” scenario in the Advanced Setup section for more information.

Why do I see "nvcc: No such file or directory" when I try to build a CUDA application?

Your PATH environment variable is not set up correctly. Ensure that your PATH includes the bin directory where you installed the Toolkit, usually /usr/local/cuda-11.5/bin.

```
export PATH=/usr/local/cuda-11.5/bin$PATH:+$PATH
```
Why do I see "error while loading shared libraries: <lib name>: cannot open shared object file: No such file or directory" when I try to run a CUDA application that uses a CUDA library?

Your LD_LIBRARY_PATH environment variable is not set up correctly. Ensure that your LD_LIBRARY_PATH includes the lib and/or lib64 directory where you installed the Toolkit, usually /usr/local/cuda-11.5/lib{,64}:

```bash
export LD_LIBRARY_PATH=/usr/local/cuda-11.5/lib\${LD_LIBRARY_PATH:+:${LD_LIBRARY_PATH}}
```

Why do I see multiple "404 Not Found" errors when updating my repository meta-data on Ubuntu?

These errors occur after adding a foreign architecture because apt is attempting to query for each architecture within each repository listed in the system’s sources.list file. Repositories that do not host packages for the newly added architecture will present this error. While noisy, the error itself does no harm. Please see the Advanced Setup section for details on how to modify your sources.list file to prevent these errors.

How can I tell X to ignore a GPU for compute-only use?

To make sure X doesn’t use a certain GPU for display, you need to specify which other GPU to use for display. For more information, please refer to the "Use a specific GPU for rendering the display" scenario in the Advanced Setup section.

Why doesn't the cuda-repo package install the CUDA Toolkit and Drivers?

When using RPM or Deb, the downloaded package is a repository package. Such a package only informs the package manager where to find the actual installation packages, but will not install them.
How do I get CUDA to work on a laptop with an iGPU and a dGPU running Ubuntu14.04?

After installing CUDA, set the driver value for the intel device in /etc/X11/xorg.conf to 'modesetting' as shown below:

```plaintext
Section "Device"
  Identifier "intel"
  Driver "modesetting"
  ...
EndSection
```

To prevent Ubuntu from reverting the change in xorg.conf, edit /etc/default/grub to add "nogpumanager" to GRUB_CMDLINE_LINUX_DEFAULT.

Run the following command to update grub before rebooting:

```
sudo update-grub
```

What do I do if the display does not load, or CUDA does not work, after performing a system update?

System updates may include an updated Linux kernel. In many cases, a new Linux kernel will be installed without properly updating the required Linux kernel headers and development packages. To ensure the CUDA driver continues to work when performing a system update, rerun the commands in the Kernel Headers and Development Packages section.

Additionally, on Fedora, the Akmods framework will sometimes fail to correctly rebuild the NVIDIA kernel module packages when a new Linux kernel is installed. When this happens, it is usually sufficient to invoke Akmods manually and regenerate the module mapping files by running the following commands in a virtual console, and then rebooting:

```
sudo akmods --force
sudo depmod
```

You can reach a virtual console by hitting `ctrl+alt+f2` at the same time.
How do I install a CUDA driver with a version less than 367 using a network repo?

To install a CUDA driver at a version earlier than 367 using a network repo, the required packages will need to be explicitly installed at the desired version. For example, to install 352.99, instead of installing the cuda-drivers metapackage at version 352.99, you will need to install all required packages of cuda-drivers at version 352.99.

How do I install an older CUDA version using a network repo?

Depending on your system configuration, you may not be able to install old versions of CUDA using the cuda metapackage. In order to install a specific version of CUDA, you may need to specify all of the packages that would normally be installed by the cuda metapackage at the version you want to install.

If you are using yum to install certain packages at an older version, the dependencies may not resolve as expected. In this case you may need to pass “--setopt=obsoletes=0” to yum to allow an install of packages which are obsoleted at a later version than you are trying to install.

Why does the installation on SUSE install the Mesa-dri-nouveau dependency?

This dependency comes from the SUSE repositories and shouldn’t affect the use of the NVIDIA driver or the CUDA Toolkit. To disable this dependency, you can lock that package with the following command:

`sudo zypper al Mesa-dri-nouveau`
Now that you have CUDA-capable hardware and the NVIDIA CUDA Toolkit installed, you can examine and enjoy the numerous included programs. To begin using CUDA to accelerate the performance of your own applications, consult the *CUDA C++ Programming Guide*, located in `/usr/local/cuda-11.5/doc`.

A number of helpful development tools are included in the CUDA Toolkit to assist you as you develop your CUDA programs, such as NVIDIA® Nsight™ Eclipse Edition, NVIDIA Visual Profiler, CUDA-GDB, and CUDA-MEMCHECK.

Chapter 16. Removing CUDA Toolkit and Driver

Follow the below steps to properly uninstall the CUDA Toolkit and NVIDIA Drivers from your system. These steps will ensure that the uninstallation will be clean.

**RHEL8/CentOS8**

To remove CUDA Toolkit:

```bash
sudo dnf remove "cuda*" "*cublas*" "*cufft*" "*cufile*" "*curand*" "*cusolver*" "*cusparse*" "*gds-tools*" "*npp*" "*nvjpeg*" "*nsight*"
```

To remove NVIDIA Drivers:

```bash
sudo dnf remove nvidia-driver
```

To reset the module stream:

```bash
sudo dnf module reset nvidia-driver
```

**RHEL7/CentOS7**

To remove CUDA Toolkit:

```bash
sudo yum remove "cuda*" "*cublas*" "*cufft*" "*cufile*" "*curand*" "*cusolver*" "*cusparse*" "*gds-tools*" "*npp*" "*nvjpeg*" "*nsight*"
```

To remove NVIDIA Drivers:

```bash
sudo yum remove "*nvidia*"
```

**Fedora**

To remove CUDA Toolkit:

```bash
sudo dnf remove "cuda*" "*cublas*" "*cufft*" "*cufile*" "*curand*" "*cusolver*" "*cusparse*" "*gds-tools*" "*npp*" "*nvjpeg*" "*nsight*"
```

To remove 3rd party NVIDIA Drivers:

```bash
sudo dnf remove "*nvidia*"
```
To remove NVIDIA Drivers:

```bash
sudo dnf remove nvidia-driver
```

To reset the module stream:

```bash
sudo dnf module reset nvidia-driver
```

**OpenSUSE/SLES**

To remove CUDA Toolkit:

```bash
sudo zypper remove "cuda*" "*cublas*" "*cufft*" "*cufile*" "*curand*" "
*cusolver*" "*cusparse*" "*gds-tools*" "*npp*" "*nvjpeg*" "*nsight*"
```

To remove NVIDIA Drivers:

```bash
sudo zypper remove "*nvidia*"
```

**Ubuntu and Debian**

To remove CUDA Toolkit:

```bash
sudo apt-get --purge remove "*cuda*" "*cublas*" "*cufft*" "*cufile*" "*curand*" "
*cusolver*" "*cusparse*" "*gds-tools*" "*npp*" "*nvjpeg*" "*nsight*"
```

To remove NVIDIA Drivers:

```bash
sudo apt-get --purge remove "*nvidia*"
```

To clean up the uninstall:

```bash
sudo apt-get autoremove
```
