Chapter 1. Introduction

The cuSPARSE library contains a set of basic linear algebra subroutines used for handling sparse matrices. The library targets matrices with a number of (structural) zero elements which represent > 95% of the total entries.

It is implemented on top of the NVIDIA® CUDA™ runtime (which is part of the CUDA Toolkit) and is designed to be called from C and C++.

The library routines can be classified into four categories:

- Level 1: operations between a vector in sparse format and a vector in dense format
- Level 2: operations between a matrix in sparse format and a vector in dense format
- Level 3: operations between a matrix in sparse format and a set of vectors in dense format (which can also usually be viewed as a dense tall matrix)
- Conversion: operations that allow conversion between different matrix formats, and compression of csr matrices.

The cuSPARSE library allows developers to access the computational resources of the NVIDIA graphics processing unit (GPU), although it does not auto-parallelize across multiple GPUs. The cuSPARSE API assumes that input and output data reside in GPU (device) memory, unless it is explicitly indicated otherwise by the string DevHostPtr in a function parameter’s name.

It is the responsibility of the developer to allocate memory and to copy data between GPU memory and CPU memory using standard CUDA runtime API routines, such as cudaMalloc(), cudaFree(), cudaMemcpy(), and cudaMemcpyAsync().

1.1. Naming Conventions

The cuSPARSE library functions are available for data types float, double, cuComplex, and cuDoubleComplex. The sparse Level 1, Level 2, and Level 3 functions follow this naming convention:

cusparse<t>[<matrix data format>]<operation>[<output matrix data format>]

where <t> can be S, D, C, Z, or X, corresponding to the data types float, double, cuComplex, cuDoubleComplex, and the generic type, respectively.

The <matrix data format> can be dense, coo, csr, or csc, corresponding to the dense, coordinate, compressed sparse row, and compressed sparse column formats, respectively.
Finally, the \texttt{operation} can be \texttt{axpyi}, \texttt{gthr}, \texttt{gthrz}, \texttt{roti}, or \texttt{sctr}, corresponding to the Level 1 functions; it also can be \texttt{mv} or \texttt{sv}, corresponding to the Level 2 functions, as well as \texttt{mm} or \texttt{sm}, corresponding to the Level 3 functions.

All of the functions have the return type \texttt{cusparseStatus\_t} and are explained in more detail in the chapters that follow.

### 1.2. Asynchronous Execution

The cuSPARSE library functions are executed asynchronously with respect to the host and may return control to the application on the host before the result is ready. Developers can use the \texttt{cudaDeviceSynchronize()} function to ensure that the execution of a particular cuSPARSE library routine has completed.

A developer can also use the \texttt{cudaMemcpy()} routine to copy data from the device to the host and vice versa, using the \texttt{cudaMemcpyDeviceToHost} and \texttt{cudaMemcpyHostToDevice} parameters, respectively. In this case there is no need to add a call to \texttt{cudaDeviceSynchronize()} because the call to \texttt{cudaMemcpy()} with the above parameters is blocking and completes only when the results are ready on the host.

### 1.3. Static Library support

Starting with release 6.5, the cuSPARSE Library is also delivered in a static form as \texttt{libcusparse\_static.a} on Linux and Mac OSes. The static cuSPARSE library and all others static maths libraries depend on a common thread abstraction layer library called \texttt{libculibos.a} on Linux and Mac and \texttt{culibos.lib} on Windows.

For example, on linux, to compile a small application using cuSPARSE against the dynamic library, the following command can be used:

```
nvcc myCusparseApp.c  -lcusparse  -o myCusparseApp
```

Whereas to compile against the static cuSPARSE library, the following command has to be used:

```
nvcc myCusparseApp.c  -lcusparse\_static  -lculibos -o myCusparseApp
```

It is also possible to use the native Host C++ compiler. Depending on the Host Operating system, some additional libraries like \texttt{pthread} or \texttt{dl} might be needed on the linking line. The following command on Linux is suggested:

```
g++ myCusparseApp.c  -lcusparse\_static  -lculibos -lcudart\_static -lpthread -ldl -I <cuda-toolkit-path>/include -L <cuda-toolkit-path>/lib64 -o myCusparseApp
```

Note that in the latter case, the library \texttt{cuda} is not needed. The CUDA Runtime will try to open explicitly the \texttt{cuda} library if needed. In the case of a system which does not have the CUDA driver installed, this allows the application to gracefully manage this issue and potentially run if a CPU-only path is available.
Chapter 2. Using the cuSPARSE API

This chapter describes how to use the cuSPARSE library API. It is not a reference for the cuSPARSE API data types and functions; that is provided in subsequent chapters.

2.1. Thread Safety

The library is thread safe and its functions can be called from multiple host threads. However, simultaneous read/writes of the same objects (or of the same handle) are not safe. Hence the handle must be private per thread, i.e., only one handle per thread is safe.

2.2. Scalar Parameters

In the cuSPARSE API, the scalar parameters $\alpha$ and $\beta$ can be passed by reference on the host or the device.

The few functions that return a scalar result, such as $nnz()$, return the resulting value by reference on the host or the device. Even though these functions return immediately, similarly to those that return matrix and vector results, the scalar result is not ready until execution of the routine on the GPU completes. This requires proper synchronization be used when reading the result from the host.

This feature allows the cuSPARSE library functions to execute completely asynchronously using streams, even when $\alpha$ and $\beta$ are generated by a previous kernel. This situation arises, for example, when the library is used to implement iterative methods for the solution of linear systems and eigenvalue problems [3].

2.3. Parallelism with Streams

If the application performs several small independent computations, or if it makes data transfers in parallel with the computation, CUDA streams can be used to overlap these tasks.

The application can conceptually associate a stream with each task. To achieve the overlap of computation between the tasks, the developer should create CUDA streams using the function $cudaStreamCreate()$ and set the stream to be used by each individual cuSPARSE library routine by calling $cusparseSetStream()$ just before calling the actual cuSPARSE routine. Then, computations performed in separate streams would be overlapped automatically on the
Using the cuSPARSE API

GPU, when possible. This approach is especially useful when the computation performed by a single task is relatively small and is not enough to fill the GPU with work, or when there is a data transfer that can be performed in parallel with the computation.

When streams are used, we recommend using the new cuSPARSE API with scalar parameters and results passed by reference in the device memory to achieve maximum computational overlap.

Although a developer can create many streams, in practice it is not possible to have more than 16 concurrent kernels executing at the same time.

2.4. Compatibility and Versioning

The cuSPARSE APIs are intended to be backward compatible at the source level with future releases (unless stated otherwise in the release notes of a specific future release). In other words, if a program uses cuSPARSE, it should continue to compile and work correctly with newer versions of cuSPARSE without source code changes. cuSPARSE is not guaranteed to be backward compatible at the binary level. Using different versions of the cusparse.h header file and the shared library is not supported. Using different versions of cuSPARSE and the CUDA runtime is not supported. The APIs should be backward compatible at the source level for public functions in most cases

2.5. Optimization Notes

Most of the cuSPARSE routines can be optimized by exploiting CUDA Graphs capture and Hardware Memory Compression features.

More in details, a single cuSPARSE call or a sequence of calls can be captured by a CUDA Graph and executed in a second moment. This minimizes kernels launch overhead and allows the CUDA runtime to optimize the whole workflow. A full example of CUDA graphs capture applied to a cuSPARSE routine can be found in cuSPARSE Library Samples - CUDA Graph.

Secondly, the data types and functionalities involved in cuSPARSE are suitable for Hardware Memory Compression available in Ampere GPU devices (compute capability 8.0) or above. The feature allows memory compression for data with enough zero bytes without no loss of information. The device memory must be allocation with the CUDA driver APIs. A full example of Hardware Memory Compression applied to a cuSPARSE routine can be found in cuSPARSE Library Samples - Memory Compression.
Chapter 3. cuSPARSE Indexing and Data Formats

The cuSPARSE library supports dense and sparse vector, and dense and sparse matrix formats.

3.1. Index Base Format

The library supports zero- and one-based indexing. The index base is selected through the `cusparseIndexBase_t` type, which is passed as a standalone parameter or as a field in the matrix descriptor `cusparseMatDescr_t` type.

3.1.1. Vector Formats

This section describes dense and sparse vector formats.

3.1.1.1. Dense Format

Dense vectors are represented with a single data array that is stored linearly in memory, such as the following $7 \times 1$ dense vector:

\[
\begin{bmatrix}
1.0 & 0.0 & 0.0 & 2.0 & 3.0 & 0.0 & 4.0
\end{bmatrix}
\]

(This vector is referenced again in the next section.)

3.1.1.2. Sparse Format

Sparse vectors are represented with two arrays.

- The data array has the nonzero values from the equivalent array in dense format.
- The integer index array has the positions of the corresponding nonzero values in the equivalent array in dense format.

For example, the dense vector in section 3.2.1 can be stored as a sparse vector with one-based indexing.

\[
\begin{bmatrix}
1.0 & 2.0 & 3.0 & 4.0 \\
1 & 4 & 5 & 7
\end{bmatrix}
\]
It can also be stored as a sparse vector with zero-based indexing.

\[
\begin{bmatrix}
  1.0 & 2.0 & 3.0 & 4.0 \\
  0 & 3 & 4 & 6
\end{bmatrix}
\]

In each example, the top row is the data array and the bottom row is the index array, and it is assumed that the indices are provided in increasing order and that each index appears only once.

### 3.2. Matrix Formats

Dense and several sparse formats for matrices are discussed in this section.

#### 3.2.1. Dense Format

The dense matrix \( X \) is assumed to be stored in column-major format in memory and is represented by the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( m )</td>
<td>(integer) The number of rows in the matrix.</td>
</tr>
<tr>
<td>( n )</td>
<td>(integer) The number of columns in the matrix.</td>
</tr>
<tr>
<td>( ldX )</td>
<td>(integer) The leading dimension of ( X ), which must be greater than or equal to ( m ). If ( ldX ) is greater than ( m ), then ( X ) represents a sub-matrix of a larger matrix stored in memory.</td>
</tr>
<tr>
<td>( X )</td>
<td>(pointer) Points to the data array containing the matrix elements. It is assumed that enough storage is allocated for ( X ) to hold all of the matrix elements and that cuSPARSE library functions may access values outside of the sub-matrix, but will never overwrite them.</td>
</tr>
</tbody>
</table>

For example, \( m \times n \) dense matrix \( X \) with leading dimension \( ldX \) can be stored with one-based indexing as shown.

\[
\begin{bmatrix}
  X_{11} & X_{12} & \cdots & X_{1n} \\
  X_{21} & X_{22} & \cdots & X_{2n} \\
  \vdots & \vdots & \ddots & \vdots \\
  X_{m1} & X_{m2} & \cdots & X_{mn} \\
  X_{ldX1} & X_{ldX2} & \cdots & X_{ldXn}
\end{bmatrix}
\]

Its elements are arranged linearly in memory in the order below.

\[
\begin{bmatrix}
  X_{11} & X_{21} & \cdots & X_{m1} & \cdots & X_{ldX1} & \cdots & X_{1n} & X_{2n} & \cdots & X_{mn} & \cdots & X_{ldXn}
\end{bmatrix}
\]

**Note:** This format and notation are similar to those used in the NVIDIA CUDA cuBLAS library.

#### 3.2.2. Coordinate Format (COO)

The \( m \times n \) sparse matrix \( A \) is represented in COO format by the following parameters.
### 3.2.2. Compressed Sparse Row Format (CSR)

The only way the CSR differs from the COO format is that the array containing the row indices is compressed in CSR format. The \( m \times n \) sparse matrix \( A \) is represented in CSR format by the following parameters.

<table>
<thead>
<tr>
<th>nnz</th>
<th>[integer] The number of nonzero elements in the matrix.</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrValA</td>
<td>[pointer] Points to the data array of length ( \text{nnz} ) that holds all nonzero values of ( A ) in row-major format.</td>
</tr>
<tr>
<td>csrRowPtrA</td>
<td>[pointer] Points to the integer array of length ( m+1 ) that holds indices into the arrays csrColIndA and csrValA. The first ( m ) entries of this array contain the indices of the first nonzero element in the ( i )th row for ( i=0,\ldots,m ), while the last entry contains ( \text{nnz}+\text{csrRowPtrA}(0) ). In general, ( \text{csrRowPtrA}(0) ) is 0 or 1 for zero- and one-based indexing, respectively.</td>
</tr>
<tr>
<td>csrColIndA</td>
<td>[pointer] Points to the integer array of length ( \text{nnz} ) that contains the column indices of the corresponding elements in array csrValA.</td>
</tr>
</tbody>
</table>

A sparse matrix in COO format is assumed to be stored in row-major format: the index arrays are first sorted by row indices and then within the same row by compressed column indices. It is assumed that each pair of row and column indices appears only once.

For example, consider the following \( 4 \times 5 \) matrix \( A \).

\[
\begin{bmatrix}
1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\
0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\
5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\
0.0 & 0.0 & 9.0 & 0.0 & 6.0
\end{bmatrix}
\]

It is stored in COO format with zero-based indexing this way.

\[
\begin{align*}
\text{cooValA} &= [1.0, 4.0, 2.0, 3.0, 5.0, 7.0, 8.0, 9.0, 6.0] \\
\text{cooRowIndA} &= [0, 0, 1, 1, 2, 2, 2, 3, 3] \\
\text{cooColIndA} &= [0, 1, 1, 2, 0, 3, 4, 2, 4]
\end{align*}
\]

In the COO format with one-based indexing, it is stored as shown.

\[
\begin{align*}
\text{cooValA} &= [1.0, 4.0, 2.0, 3.0, 5.0, 7.0, 8.0, 9.0, 6.0] \\
\text{cooRowIndA} &= [1, 1, 2, 2, 3, 3, 3, 4, 4] \\
\text{cooColIndA} &= [1, 2, 2, 3, 1, 4, 5, 3, 5]
\end{align*}
\]
Sparse matrices in CSR format are assumed to be stored in row-major CSR format, in other words, the index arrays are first sorted by row indices and then within the same row by column indices. It is assumed that each pair of row and column indices appears only once. Consider again the $4 \times 5$ matrix $A$.

$$
\begin{bmatrix}
1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\
0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\
5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\
0.0 & 0.0 & 9.0 & 0.0 & 6.0
\end{bmatrix}
$$

It is stored in CSR format with zero-based indexing as shown.

\begin{align*}
csrValA &= [1.0 \ 4.0 \ 2.0 \ 3.0 \ 5.0 \ 7.0 \ 8.0 \ 9.0 \ 6.0] \\
csrRowPtrA &= [0 \ 2 \ 4 \ 7 \ 9] \\
csrColIndA &= [0 \ 1 \ 1 \ 2 \ 0 \ 3 \ 4 \ 2 \ 4]
\end{align*}

This is how it is stored in CSR format with one-based indexing.

\begin{align*}
csrValA &= [1.0 \ 4.0 \ 2.0 \ 3.0 \ 5.0 \ 7.0 \ 8.0 \ 9.0 \ 6.0] \\
csrRowPtrA &= [1 \ 3 \ 5 \ 8 \ 10] \\
csrColIndA &= [1 \ 2 \ 2 \ 3 \ 1 \ 4 \ 5 \ 3 \ 5]
\end{align*}

### 3.2.4. Compressed Sparse Column Format (CSC)

The CSC format is different from the COO format in two ways: the matrix is stored in column-major format, and the array containing the column indices is compressed in CSC format. The $m \times n$ matrix $A$ is represented in CSC format by the following parameters.

<table>
<thead>
<tr>
<th>nnz</th>
<th>[integer]</th>
<th>The number of nonzero elements in the matrix.</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscValA</td>
<td>[pointer]</td>
<td>Points to the data array of length $nnz$ that holds all nonzero values of $A$ in column-major format.</td>
</tr>
<tr>
<td>cscRowIndA</td>
<td>[pointer]</td>
<td>Points to the integer array of length $nnz$ that contains the row indices of the corresponding elements in array $cscValA$.</td>
</tr>
<tr>
<td>cscColPtrA</td>
<td>[pointer]</td>
<td>Points to the integer array of length $n+1$ that holds indices into the arrays $cscRowIndA$ and $cscValA$. The first $n$ entries of this array contain the indices of the first nonzero element in the $i$th row for $i=i,...,n$, while the last entry contains $nnz+cscColPtrA(0)$. In general, $cscColPtrA(0)$ is 0 or 1 for zero- and one-based indexing, respectively.</td>
</tr>
</tbody>
</table>

**Note:** The matrix $A$ in CSR format has exactly the same memory layout as its transpose in CSC format (and vice versa).

For example, consider once again the $4 \times 5$ matrix $A$.

$$
\begin{bmatrix}
1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\
0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\
5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\
0.0 & 0.0 & 9.0 & 0.0 & 6.0
\end{bmatrix}
$$
It is stored in CSC format with zero-based indexing this way.

\[
\begin{align*}
cscValA &= [1.0, 5.0, 4.0, 2.0, 3.0, 9.0, 7.0, 8.0, 6.0] \\
cscRowIndA &= [0, 2, 0, 1, 1, 3, 2, 2, 3] \\
cscColPtrA &= [0, 2, 4, 6, 7, 9]
\end{align*}
\]

In CSC format with one-based indexing, this is how it is stored.

\[
\begin{align*}
cscValA &= [1.0, 5.0, 4.0, 2.0, 3.0, 9.0, 7.0, 8.0, 6.0] \\
cscRowIndA &= [1, 3, 1, 2, 2, 4, 3, 4] \\
cscColPtrA &= [1, 3, 5, 7, 8, 10]
\end{align*}
\]

Each pair of row and column indices appears only once.

### 3.2.5. Block Compressed Sparse Row Format (BSR)

The only difference between the CSR and BSR formats is the format of the storage element. The former stores primitive data types \{single, double, cuComplex, and cuDoubleComplex\} whereas the latter stores a two-dimensional square block of primitive data types. The dimension of the square block is \(blockDim\). The \(m \times n\) sparse matrix \(A\) is equivalent to a block sparse matrix \(A_b\) with \(mb = \frac{m + blockDim - 1}{blockDim}\) block rows and \(nb = \frac{n + blockDim - 1}{blockDim}\) block columns. If \(m\) or \(n\) is not multiple of \(blockDim\), then zeros are filled into \(A_b\).

\(A\) is represented in BSR format by the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>blockDim</td>
<td>integer</td>
<td>Block dimension of matrix (A).</td>
</tr>
<tr>
<td>mb</td>
<td>integer</td>
<td>The number of block rows of (A).</td>
</tr>
<tr>
<td>nb</td>
<td>integer</td>
<td>The number of block columns of (A).</td>
</tr>
<tr>
<td>nnzb</td>
<td>integer</td>
<td>The number of nonzero blocks in the matrix.</td>
</tr>
<tr>
<td>bsrValA</td>
<td>pointer</td>
<td>Points to the data array of length (nnzb \times blockDim^2) that holds all elements of nonzero blocks of (A). The block elements are stored in either column-major order or row-major order.</td>
</tr>
<tr>
<td>bsrRowPtrA</td>
<td>pointer</td>
<td>Points to the integer array of length (mb + 1) that holds indices into the arrays bsrColIndA and bsrValA. The first (mb) entries of this array contain the indices of the first nonzero block in the (i)th block row for (i = 1, \ldots, mb), while the last entry contains (nnzb + bsrRowPtrA(0)). In general, (bsrRowPtrA(0)) is 0 or 1 for zero- and one-based indexing, respectively.</td>
</tr>
<tr>
<td>bsrColIndA</td>
<td>pointer</td>
<td>Points to the integer array of length (nnzb) that contains the column indices of the corresponding blocks in array bsrValA.</td>
</tr>
</tbody>
</table>

As with CSR format, \((row, column)\) indices of BSR are stored in row-major order. The index arrays are first sorted by row indices and then within the same row by column indices.

For example, consider again the \(4 \times 5\) matrix \(A\).

\[
\begin{bmatrix}
1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\
0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\
5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\
0.0 & 0.0 & 9.0 & 0.0 & 6.0
\end{bmatrix}
\]
If `blockDim` is equal to 2, then `mb` is 2, `nb` is 3, and matrix $A$ is split into $2 \times 3$ block matrix $A_b$. The dimension of $A_b$ is $4 \times 6$, slightly bigger than matrix $A$, so zeros are filled in the last column of $A_b$. The element-wise view of $A_b$ is this.

\[
\begin{bmatrix}
    1.0 & 4.0 & 0.0 & 0.0 & 0.0 & 0.0 \\
    0.0 & 2.0 & 3.0 & 0.0 & 0.0 & 0.0 \\
    5.0 & 0.0 & 0.0 & 7.0 & 8.0 & 0.0 \\
    0.0 & 0.0 & 9.0 & 0.0 & 6.0 & 0.0 \\
\end{bmatrix}
\]

Based on zero-based indexing, the block-wise view of $A_b$ can be represented as follows.

\[
\begin{bmatrix}
    A_{00} & A_{01} & A_{02} \\
    A_{10} & A_{11} & A_{12} \\
\end{bmatrix}
\]

The basic element of BSR is a nonzero $A_{ij}$ block, one that contains at least one nonzero element of $A$. Five of six blocks are nonzero in $A_b$.

\[
\begin{align*}
    A_{00} &= \begin{bmatrix} 1 & 4 \\ 0 & 2 \end{bmatrix},
    A_{01} &= \begin{bmatrix} 0 & 0 \\ 3 & 0 \end{bmatrix},
    A_{10} &= \begin{bmatrix} 5 & 0 \\ 0 & 0 \end{bmatrix},
    A_{11} &= \begin{bmatrix} 0 & 7 \\ 9 & 0 \end{bmatrix},
    A_{12} &= \begin{bmatrix} 8 & 0 \\ 6 & 0 \end{bmatrix}
\end{align*}
\]

BSR format only stores the information of nonzero blocks, including block indices $(i, j)$ and values $A_{ij}$. Also row indices are compressed in CSR format.

- $bsrValA = [A_{00}, A_{01}, A_{10}, A_{11}, A_{12}]$
- $bsrRowPtrA = [0, 2, 5]$
- $bsrColIndA = [0, 1, 0, 1, 2]$

There are two ways to arrange the data element of block $A_{ij}$: row-major order and column-major order. Under column-major order, the physical storage of $bsrValA$ is this.

- $bsrValA = [1 \ 0 \ 4 \ 2 \ 0 \ 3 \ 0 \ 0 \ 5 \ 0 \ 0 \ 0 \ 0 \ 0 \ 9 \ 7 \ 0 \ 8 \ 6 \ 0 \ 0 \ 0 ]$

Under row-major order, the physical storage of $bsrValA$ is this.

- $bsrValA = [1 \ 4 \ 0 \ 2 \ 0 \ 0 \ 3 \ 0 \ 5 \ 0 \ 0 \ 0 \ 0 \ 7 \ 9 \ 0 \ 8 \ 0 \ 6 \ 0 \ 0 ]$

Similarly, in BSR format with one-based indexing and column-major order, $A$ can be represented by the following.

\[
\begin{bmatrix}
    A_{11} & A_{12} & A_{13} \\
    A_{21} & A_{22} & A_{23} \\
\end{bmatrix}
\]

- $bsrValA = [1 \ 0 \ 4 \ 2 \ 0 \ 3 \ 0 \ 0 \ 5 \ 0 \ 0 \ 0 \ 0 \ 9 \ 7 \ 0 \ 8 \ 6 \ 0 \ 0 \ 0 ]$

- $bsrRowPtrA = [1 \ 3 \ 6]$
- $bsrColIndA = [1 \ 2 \ 1 \ 2 \ 3]$

**Note:** The general BSR format has two parameters, `rowBlockDim` and `colBlockDim`. `rowBlockDim` is number of rows within a block and `colBlockDim` is number of columns within a block. If `rowBlockDim=colBlockDim`, general BSR format is the same as BSR format.
Note: In the cuSPARSE Library, the storage format of blocks in BSR format can be column-major or row-major, independently of the base index. However, if the developer uses BSR format from the Math Kernel Library (MKL) and wants to directly interface with the cuSPARSE Library, then `cusparseDirection_t CUSPARSE_DIRECTION_COLUMN` should be used if the base index is one; otherwise, `cusparseDirection_t CUSPARSE_DIRECTION_ROW` should be used.

3.2.6. Extended BSR Format (BSRX)

BSRX is the same as the BSR format, but the array `bsrRowPtrA` is separated into two parts. The first nonzero block of each row is still specified by the array `bsrRowPtrA`, which is the same as in BSR, but the position next to the last nonzero block of each row is specified by the array `bsrEndPtrA`. Briefly, BSRX format is simply like a 4-vector variant of BSR format.

Matrix $A$ is represented in BSRX format by the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>blockDim</code></td>
<td>integer</td>
<td>Block dimension of matrix $A$.</td>
</tr>
<tr>
<td><code>mb</code></td>
<td>integer</td>
<td>The number of block rows of $A$.</td>
</tr>
<tr>
<td><code>nb</code></td>
<td>integer</td>
<td>The number of block columns of $A$.</td>
</tr>
<tr>
<td><code>nnzb</code></td>
<td>integer</td>
<td>Number of nonzero blocks in the matrix $A$.</td>
</tr>
<tr>
<td><code>bsrValA</code></td>
<td>pointer</td>
<td>Points to the data array of length $nnzb \times blockDim^2$ that holds all the elements of the nonzero blocks of $A$. The block elements are stored in either column-major order or row-major order.</td>
</tr>
<tr>
<td><code>bsrRowPtrA</code></td>
<td>pointer</td>
<td>Points to the integer array of length $mb$ that holds indices into the arrays <code>bsrColIndA</code> and <code>bsrValA</code>; <code>bsrRowPtrA(i)</code> is the position of the first nonzero block of the $i^{th}$ block row in <code>bsrColIndA</code> and <code>bsrValA</code>.</td>
</tr>
<tr>
<td><code>bsrEndPtrA</code></td>
<td>pointer</td>
<td>Points to the integer array of length $mb$ that holds indices into the arrays <code>bsrColIndA</code> and <code>bsrValA</code>; <code>bsrRowPtrA(i)</code> is the position next to the last nonzero block of the $i^{th}$ block row in <code>bsrColIndA</code> and <code>bsrValA</code>.</td>
</tr>
<tr>
<td><code>bsrColIndA</code></td>
<td>pointer</td>
<td>Points to the integer array of length $nnzb$ that contains the column indices of the corresponding blocks in array <code>bsrValA</code>.</td>
</tr>
</tbody>
</table>

A simple conversion between BSR and BSRX can be done as follows. Suppose the developer has a $2 \times 3$ block sparse matrix $A_b$, represented as shown.

$$A_b = \begin{bmatrix} A_{00} & A_{01} & A_{02} \\ A_{10} & A_{11} & A_{12} \end{bmatrix}$$

Assume it has this BSR format.

- `bsrValA` of BSR: $\begin{bmatrix} A_{00} & A_{01} & A_{10} & A_{11} & A_{12} \end{bmatrix}$
- `bsrRowPtrA` of BSR: $\begin{bmatrix} 0 & 2 & 5 \end{bmatrix}$
- `bsrColIndA` of BSR: $\begin{bmatrix} 0 & 1 & 0 & 1 & 2 \end{bmatrix}$
The `bsrRowPtrA` of the BSRX format is simply the first two elements of the `bsrRowPtrA` BSR format. The `bsrEndPtrA` of BSRX format is the last two elements of the `bsrRowPtrA` of BSR format.

\[
\begin{align*}
\text{bsrRowPtrA of BSRX} &= [0 \quad 2] \\
\text{bsrEndPtrA of BSRX} &= [2 \quad 5]
\end{align*}
\]

The advantage of the BSRX format is that the developer can specify a submatrix in the original BSR format by modifying `bsrRowPtrA` and `bsrEndPtrA` while keeping `bsrColIndA` and `bsrValA` unchanged.

For example, to create another block matrix \( \hat{A} = \begin{bmatrix} O & O & O \\ O & A_{11} & O \end{bmatrix} \) that is slightly different from \( A \), the developer can keep `bsrColIndA` and `bsrValA`, but reconstruct \( \hat{A} \) by properly setting of `bsrRowPtrA` and `bsrEndPtrA`. The following 4-vector characterizes \( \hat{A} \).

\[
\begin{align*}
\text{bsrValA of } \hat{A} &= [A_{00} \quad A_{01} \quad A_{10} \quad A_{11} \quad A_{12}] \\
\text{bsrColIndA of } \hat{A} &= [0 \quad 1 \quad 0 \quad 1 \quad 2] \\
\text{bsrRowPtrA of } \hat{A} &= [0 \quad 3] \\
\text{bsrEndPtrA of } \hat{A} &= [0 \quad 4]
\end{align*}
\]
Chapter 4. cuSPARSE Types Reference

4.1. Data types

The float, double, cuComplex, and cuDoubleComplex data types are supported. The first two are standard C data types, while the last two are exported from cuComplex.h.

4.2. cusparseStatus_t

This data type represents the status returned by the library functions and it can have the following values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_STATUS_SUCCESS</td>
<td>The operation completed successfully</td>
</tr>
<tr>
<td></td>
<td>The cuSPARSE library was not initialized. This is usually caused by the lack of a prior call, an error in the CUDA Runtime API called by the cuSPARSE routine, or an error in the hardware setup</td>
</tr>
<tr>
<td></td>
<td>To correct: call cusparseCreate() prior to the function call; and check that the hardware, an appropriate version of the driver, and the cuSPARSE library are correctly installed</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_NOT_INITIALIZED</td>
<td>The error also applies to generic APIs [Generic APIs reference] for indicating a matrix/vector descriptor not initialized</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_ALLOC_FAILED</td>
<td>Resource allocation failed inside the cuSPARSE library. This is usually caused by a device memory allocation [cudaMalloc()] or by a host memory allocation failure</td>
</tr>
<tr>
<td></td>
<td>To correct: prior to the function call, deallocate previously allocated memory as much as possible</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_INVALID_VALUE</td>
<td>An unsupported value or parameter was passed to the function [a negative vector size, for example]</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_ARCH_MISMATCH</td>
<td>The function requires a feature absent from the device architecture</td>
</tr>
<tr>
<td></td>
<td><strong>To correct:</strong> compile and run the application on a device with appropriate compute capability</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_EXECUTION_FAILED</td>
<td>The GPU program failed to execute. This is often caused by a launch failure of the kernel on the GPU, which can be caused by multiple reasons</td>
</tr>
<tr>
<td></td>
<td><strong>To correct:</strong> check that the hardware, an appropriate version of the driver, and the cuSPARSE library are correctly installed</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_INTERNAL_ERROR</td>
<td>An internal cuSPARSE operation failed</td>
</tr>
<tr>
<td></td>
<td><strong>To correct:</strong> check that the hardware, an appropriate version of the driver, and the cuSPARSE library are correctly installed. Also, check that the memory passed as a parameter to the routine is not being deallocated prior to the routine completion</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</td>
<td>The matrix type is not supported by this function. This is usually caused by passing an invalid matrix descriptor to the function</td>
</tr>
<tr>
<td></td>
<td><strong>To correct:</strong> check that the fields in cusparseMatDescr_t descrA were set correctly</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_NOT_SUPPORTED</td>
<td>The operation or data type combination is currently not supported by the function</td>
</tr>
<tr>
<td>CUSPARSE_STATUS_INSUFFICIENT_RESOURCES</td>
<td>The resources for the computation, such as GPU global or shared memory, are not sufficient to complete the operation. The error can also indicate that the current computation mode [e.g. bit size of sparse matrix indices] does not allow to handle the given input</td>
</tr>
</tbody>
</table>

### 4.3. cusparseHandle_t

This is a pointer type to an opaque cuSPARSE context, which the user must initialize by calling prior to calling cusparseCreate() any other library function. The handle created and returned by cusparseCreate() must be passed to every cuSPARSE function.
4.4. **cusparsePointerMode_t**

This type indicates whether the scalar values are passed by reference on the host or device. It is important to point out that if several scalar values are passed by reference in the function call, all of them will conform to the same single pointer mode. The pointer mode can be set and retrieved using `cusparseSetPointerMode()` and `cusparseGetPointerMode()` routines, respectively.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_POINTER_MODE_HOST</td>
<td>the scalars are passed by reference on the host.</td>
</tr>
<tr>
<td>CUSPARSE_POINTER_MODE_DEVICE</td>
<td>the scalars are passed by reference on the device.</td>
</tr>
</tbody>
</table>

4.5. **cusparseOperation_t**

This type indicates which operations need to be performed with the sparse matrix.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_OPERATION_NON_TRANSPOSE</td>
<td>the non-transpose operation is selected.</td>
</tr>
<tr>
<td>CUSPARSE_OPERATION_TRANSPOSE</td>
<td>the transpose operation is selected.</td>
</tr>
<tr>
<td>CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE</td>
<td>the conjugate transpose operation is selected.</td>
</tr>
</tbody>
</table>

4.6. **cusparseAction_t**

This type indicates whether the operation is performed only on indices or on data and indices.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_ACTION_SYMBOLIC</td>
<td>the operation is performed only on indices.</td>
</tr>
<tr>
<td>CUSPARSE_ACTION_NUMERIC</td>
<td>the operation is performed on data and indices.</td>
</tr>
</tbody>
</table>

4.7. **cusparseDirection_t**

This type indicates whether the elements of a dense matrix should be parsed by rows or by columns (assuming column-major storage in memory of the dense matrix) in function `cusparse[SIDIC|Z]nnz`. Besides storage format of blocks in BSR format is also controlled by this type.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_DIRECTION_ROW</td>
<td>the matrix should be parsed by rows.</td>
</tr>
</tbody>
</table>
Value | Meaning
---|---
CUSPARSE_DIRECTION_COLUMN | the matrix should be parsed by columns.

### 4.8. `cusparseMatDescr_t`

This structure is used to describe the shape and properties of a matrix.

```c
typedef struct {
    cusparseMatrixType_t MatrixType;
    cusparseFillMode_t FillMode;
    cusparseDiagType_t DiagType;
    cusparseIndexBase_t IndexBase;
} cusparseMatDescr_t;
```

#### 4.8.1. `cusparseDiagType_t`

This type indicates if the matrix diagonal entries are unity. The diagonal elements are always assumed to be present, but if `CUSPARSE_DIAG_TYPE_UNIT` is passed to an API routine, then the routine assumes that all diagonal entries are unity and will not read or modify those entries. Note that in this case the routine assumes the diagonal entries are equal to one, regardless of what those entries are actually set to in memory.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_DIAG_TYPE_NON_UNIT</td>
<td>the matrix diagonal has non-unit elements.</td>
</tr>
<tr>
<td>CUSPARSE_DIAG_TYPE_UNIT</td>
<td>the matrix diagonal has unit elements.</td>
</tr>
</tbody>
</table>

#### 4.8.2. `cusparseFillMode_t`

This type indicates if the lower or upper part of a matrix is stored in sparse storage.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_FILL_MODE_LOWER</td>
<td>the lower triangular part is stored.</td>
</tr>
<tr>
<td>CUSPARSE_FILL_MODE_UPPER</td>
<td>the upper triangular part is stored.</td>
</tr>
</tbody>
</table>

#### 4.8.3. `cusparseIndexBase_t`

This type indicates if the base of the matrix indices is zero or one.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_INDEX_BASE_ZERO</td>
<td>the base index is zero.</td>
</tr>
<tr>
<td>CUSPARSE_INDEX_BASE_ONE</td>
<td>the base index is one.</td>
</tr>
</tbody>
</table>
4.8.4. **cusparseMatrixType_t**

This type indicates the type of matrix stored in sparse storage. Notice that for symmetric, Hermitian and triangular matrices only their lower or upper part is assumed to be stored.

The whole idea of matrix type and fill mode is to keep minimum storage for symmetric/Hermitian matrix, and also to take advantage of symmetric property on SpMV (Sparse Matrix Vector multiplication). To compute \( y = A \cdot x \) when \( A \) is symmetric and only lower triangular part is stored, two steps are needed. First step is to compute \( y = (L+D) \cdot x \) and second step is to compute \( y = L^T \cdot x + y \). Given the fact that the transpose operation \( y = L^T \cdot x \) is 10x slower than non-transpose version \( y = L \cdot x \), the symmetric property does not show up any performance gain. It is better for the user to extend the symmetric matrix to a general matrix and apply \( y = A \cdot x \) with matrix type `CUSPARSE_MATRIX_TYPE_GENERAL`.

In general, SpMV, preconditioners (incomplete Cholesky or incomplete LU) and triangular solver are combined together in iterative solvers, for example PCG and GMRES. If the user always uses general matrix (instead of symmetric matrix), there is no need to support other than general matrix in preconditioners. Therefore the new routines, [bsr|csr]sv2 [triangular solver], [bsr|csr]ilu02 [incomplete LU] and [bsr|csr]ic02 [incomplete Cholesky], only support matrix type `CUSPARSE_MATRIX_TYPE_GENERAL`.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_MATRIX_TYPE_GENERAL</td>
<td>the matrix is general.</td>
</tr>
<tr>
<td>CUSPARSE_MATRIX_TYPE_SYMMETRIC</td>
<td>the matrix is symmetric.</td>
</tr>
<tr>
<td>CUSPARSE_MATRIX_TYPE_HERMITIAN</td>
<td>the matrix is Hermitian.</td>
</tr>
<tr>
<td>CUSPARSE_MATRIX_TYPE_TRIANGULAR</td>
<td>the matrix is triangular.</td>
</tr>
</tbody>
</table>

4.9. **cusparseAlgMode_t [DEPRECATED]**

[DEPRECATED] The routine will be removed in the next major release

This is type for algorithm parameter to cusparseCsrmvEx() and cusparseCsrmvEx_bufferSize() functions.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_ALG_MERGE_PATH</td>
<td>Use load-balancing algorithm that suits better for irregular nonzero-patterns.</td>
</tr>
</tbody>
</table>

4.10. **cusparseColorInfo_t**

This is a pointer type to an opaque structure holding the information used in `csrColor()`.
4.11. cusparseSolvePolicy_t
This type indicates whether level information is generated and used in csrsv2, csric02, csrilu02, bsrsv2, bsric02 and bsrilu02.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SOLVE_POLICY_NO_LEVEL</td>
<td>no level information is generated and used.</td>
</tr>
<tr>
<td>CUSPARSE_SOLVE_POLICY_USE_LEVEL</td>
<td>generate and use level information.</td>
</tr>
</tbody>
</table>

4.12. bsric02Info_t
This is a pointer type to an opaque structure holding the information used in bsric02_bufferSize(), bsric02_analysis(), and bsric02().

4.13. bsrilu02Info_t
This is a pointer type to an opaque structure holding the information used in bsrilu02_bufferSize(), bsrilu02_analysis(), and bsrilu02().

4.14. bsrsm2Info_t
This is a pointer type to an opaque structure holding the information used in bsrsm2_bufferSize(), bsrsm2_analysis(), and bsrsm2_solve().

4.15. bsrsv2Info_t
This is a pointer type to an opaque structure holding the information used in bsrsv2_bufferSize(), bsrsv2_analysis(), and bsrsv2_solve().

4.16. csrgemm2Info_t [DEPRECATED]

[[DEPRECATED]] The routine will be removed in the next major release
This is a pointer type to an opaque structure holding the information used in csrgemm2_bufferSizeExt(), and csrgemm2().
4.17. **csric02Info_t**

This is a pointer type to an opaque structure holding the information used in `csric02_bufferSize()`, `csric02_analysis()`, and `csric02()`.

4.18. **csrilu02Info_t**

This is a pointer type to an opaque structure holding the information used in `csrilu02_bufferSize()`, `csrilu02_analysis()`, and `csrilu02()`.

4.19. **csrsm2Info_t [DEPRECATED]**

[[DEPRECATED]] *The routine will be removed in the next major release*

This is a pointer type to an opaque structure holding the information used in `csrsm2_bufferSize()`, `csrsm2_analysis()`, and `csrsm2_solve()`.

4.20. **csrsrv2Info_t [DEPRECATED]**

[[DEPRECATED]] *The routine will be removed in the next major release*

This is a pointer type to an opaque structure holding the information used in `csrsrv2_bufferSize()`, `csrsrv2_analysis()`, and `csrsrv2_solve()`.
Chapter 5. cuSPARSE Management
Function Reference

The cuSPARSE functions for managing the library are described in this section.

5.1. cusparseCreate()

cusparseStatus_t
cusparseCreate(cusparseHandle_t *handle)

This function initializes the cuSPARSE library and creates a handle on the cuSPARSE context. It must be called before any other cuSPARSE API function is invoked. It allocates hardware resources necessary for accessing the GPU.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The pointer to the handle to the cuSPARSE context</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status.

5.2. cusparseDestroy()

cusparseStatus_t
cusparseDestroy(cusparseHandle_t handle)

This function releases CPU-side resources used by the cuSPARSE library. The release of GPU-side resources may be deferred until the application shuts down.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The handle to the cuSPARSE context</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status.

5.3. cusparseGetErrorName()

const char*

cusPARSE Library
cusparseGetErrorString(cusparseStatus_t status)

The function returns the string representation of an error code enum name. If the error code is not recognized, “unrecognized error code” is returned.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>IN</td>
<td>Error code to convert to string</td>
</tr>
<tr>
<td>const char*</td>
<td>OUT</td>
<td>Pointer to a NULL-terminated string</td>
</tr>
</tbody>
</table>

5.4. cusparseGetErrorString()

cusparseGetErrorString(cusparseStatus_t status)

Returns the description string for an error code. If the error code is not recognized, “unrecognized error code” is returned.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>IN</td>
<td>Error code to convert to string</td>
</tr>
<tr>
<td>const char*</td>
<td>OUT</td>
<td>Pointer to a NULL-terminated string</td>
</tr>
</tbody>
</table>

5.5. cusparseGetProperty()

cusparseStatus_t cusparseGetProperty(libraryPropertyType type, int* value)

The function returns the value of the requested property. Refer to libraryPropertyType for supported types.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>IN</td>
<td>Requested property</td>
</tr>
<tr>
<td>value</td>
<td>OUT</td>
<td>Value of the requested property</td>
</tr>
</tbody>
</table>

libraryPropertyType (defined in library_types.h):

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAJOR_VERSION</td>
<td>Enumerator to query the major version</td>
</tr>
<tr>
<td>MINOR_VERSION</td>
<td>Enumerator to query the minor version</td>
</tr>
<tr>
<td>PATCH_LEVEL</td>
<td>Number to identify the patch level</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status

5.6. cusparseGetVersion()
This function returns the version number of the cuSPARSE library.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>cuSPARSE handle</td>
</tr>
<tr>
<td>version</td>
<td>OUT</td>
<td>The version number of the library</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

5.7. `cusparseGetPointerMode()`

This function obtains the pointer mode used by the cuSPARSE library. Please see the section on the `cusparsePointerMode_t` type for more details.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The handle to the cuSPARSE context</td>
</tr>
<tr>
<td>mode</td>
<td>OUT</td>
<td>One of the enumerated pointer mode types</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

5.8. `cusparseSetPointerMode()`

This function sets the pointer mode used by the cuSPARSE library. The default is for the values to be passed by reference on the host. Please see the section on the `cublasPointerMode_t` type for more details.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The handle to the cuSPARSE context</td>
</tr>
<tr>
<td>mode</td>
<td>IN</td>
<td>One of the enumerated pointer mode types</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

5.9. `cusparseGetStream()`

This function returns the associated CUDA stream.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The handle to the cuSPARSE context</td>
</tr>
<tr>
<td>streamId</td>
<td>IN</td>
<td>One of the enumerated stream types</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status
This function gets the cuSPARSE library stream, which is being used to execute all calls to the cuSPARSE library functions. If the cuSPARSE library stream is not set, all kernels use the default NULL stream.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The handle to the cuSPARSE context</td>
</tr>
<tr>
<td>streamId</td>
<td>OUT</td>
<td>The stream used by the library</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

### 5.10. cusparseSetStream()

```c
 cusparseStatus_t cusparseSetStream(cusparseHandle_t handle, cudaStream_t streamId)
```

This function sets the stream to be used by the cuSPARSE library to execute its routines.

<table>
<thead>
<tr>
<th>Param.</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>IN</td>
<td>The handle to the cuSPARSE context</td>
</tr>
<tr>
<td>streamId</td>
<td>IN</td>
<td>The stream to be used by the library</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status
Chapter 6. cuSPARSE Helper Function Reference

The cuSPARSE helper functions are described in this section.

6.1. cusparseCreateColorInfo()

cusparseStatus_t
 cusparseCreateColorInfo(cusparseColorInfo_t* info)

This function creates and initializes the cusparseColorInfo_t structure to default values.

Input

| info            | the pointer to the cusparseColorInfo_t structure |

See cusparseStatus_t for the description of the return status.

6.2. cusparseCreateMatDescr()

cusparseStatus_t
 cusparseCreateMatDescr(cusparseMatDescr_t *descrA)

This function initializes the matrix descriptor. It sets the fields MatrixType and IndexBase to the default values CUSPARSE_MATRIX_TYPE_GENERAL and CUSPARSE_INDEX_BASE_ZERO, respectively, while leaving other fields uninitialized.

Input

| descrA         | the pointer to the matrix descriptor. |

See cusparseStatus_t for the description of the return status.

6.3. cusparseDestroyColorInfo()

cusparseStatus_t
 cusparseDestroyColorInfo(cusparseColorInfo_t info)
This function destroys and releases any memory required by the structure.

**Input**

| info               | the pointer to the structure of csrcolor() |

See [cusparseStatus_t](#) for the description of the return status

### 6.4. cusparseDestroyMatDescr()

cusparseStatus_t
cusparseDestroyMatDescr(cusparseMatDescr_t descrA)

This function releases the memory allocated for the matrix descriptor.

**Input**

| descrA           | the matrix descriptor. |

See [cusparseStatus_t](#) for the description of the return status

### 6.5. cusparseGetMatDiagType()

cusparseDiagType_t
cusparseGetMatDiagType(const cusparseMatDescr_t descrA)

This function returns the DiagType field of the matrix descriptor descrA.

**Input**

| descrA           | the matrix descriptor. |

**Returned**

| One of the enumerated diagType types. |

### 6.6. cusparseGetMatFillMode()

cusparseFillMode_t
cusparseGetMatFillMode(const cusparseMatDescr_t descrA)

This function returns the FillMode field of the matrix descriptor descrA.

**Input**

| descrA           | the matrix descriptor. |

**Returned**

| One of the enumerated fillMode types. |
6.7. **cusparseGetMatIndexBase()**

```c
cusparseIndexBase_t
cusparseGetMatIndexBase(const cusparseMatDescr_t descrA)
```

This function returns the `IndexBase` field of the matrix descriptor `descrA`.

**Input**
- `descrA`: the matrix descriptor.

**Returned**
- One of the enumerated indexBase types.

6.8. **cusparseGetMatType()**

```c
cusparseMatrixType_t
cusparseGetMatType(const cusparseMatDescr_t descrA)
```

This function returns the `MatrixType` field of the matrix descriptor `descrA`.

**Input**
- `descrA`: the matrix descriptor.

**Returned**
- One of the enumerated matrix types.

6.9. **cusparseSetMatDiagType()**

```c
cusparseStatus_t
cusparseSetMatDiagType(cusparseMatDescr_t descrA,
                        cusparseDiagType_t diagType)
```

This function sets the `DiagType` field of the matrix descriptor `descrA`.

**Input**
- `diagType`: One of the enumerated diagType types.

**Output**
- `descrA`: the matrix descriptor.

See **cusparseStatus_t** for the description of the return status.

6.10. **cusparseSetMatFillMode()**

```c
cusparseStatus_t
cusparseSetMatFillMode(cusparseMatDescr_t descrA,
                        cusparseFillMode_t fillMode)
```

This function sets the `FillMode` field of the matrix descriptor `descrA`.

**Input**
- `fillMode`: One of the enumerated fillMode types.

**Output**
- `descrA`: the matrix descriptor.
cuSPARSE Helper Function Reference

This function sets the `fillMode` field of the matrix descriptor `descrA`.

### Input
- `fillMode`: One of the enumerated `fillMode` types.

### Output
- `descrA`: the matrix descriptor.

See `cusparseStatus_t` for the description of the return status.

6.11. `cusparseSetMatIndexBase()`

```c
cusparseStatus_t
cusparseSetMatIndexBase(cusparseMatDescr_t descrA,
cusparseIndexBase_t base)
```

This function sets the `IndexBase` field of the matrix descriptor `descrA`.

### Input
- `base`: One of the enumerated `indexBase` types.

### Output
- `descrA`: the matrix descriptor.

See `cusparseStatus_t` for the description of the return status.

6.12. `cusparseSetMatType()`

```c
cusparseStatus_t
cusparseSetMatType(cusparseMatDescr_t descrA, cusparseMatrixType_t type)
```

This function sets the `MatrixType` field of the matrix descriptor `descrA`.

### Input
- `type`: One of the enumerated matrix types.

### Output
- `descrA`: the matrix descriptor.

See `cusparseStatus_t` for the description of the return status.
6.13. cusparseCreateCsrsv2Info()

[DEPRECATED]

The routine will be removed in the next major release

cusparseStatus_t
cusparseCreateCsrsv2Info(csrsv2Info_t *info);

This function creates and initializes the solve and analysis structure of csrsv2 to default values.

Input

| info          | the pointer to the solve and analysis structure of csrsv2. |

See cusparseStatus_t for the description of the return status

6.14. cusparseDestroyCsrsv2Info()

[DEPRECATED]

The routine will be removed in the next major release

cusparseStatus_t
cusparseDestroyCsrsv2Info(csrsv2Info_t info);

This function destroys and releases any memory required by the structure.

Input

| info          | the solve (csrsv2_solve) and analysis (csrsv2_analysis) structure. |

See cusparseStatus_t for the description of the return status

6.15. cusparseCreateCsrsm2Info()

[DEPRECATED]

The routine will be removed in the next major release

cusparseStatus_t
cusparseCreateCsrsm2Info(csrsm2Info_t *info);

This function creates and initializes the solve and analysis structure of csrsm2 to default values.

Input
### 6.16. cusparseDestroyCsrsm2Info() [DEPRECATED]

**cusparseStatus_t cusparseDestroyCsrsm2Info(csrsm2Info_t info);**

This function destroys and releases any memory required by the structure.

**Input**

| info       | the pointer to the solve and analysis structure of csrsm2. |

See *cusparseStatus_t* for the description of the return status.

### 6.17. cusparseCreateCsric02Info()

**cusparseStatus_t cusparseCreateCsric02Info(csric02Info_t *info);**

This function creates and initializes the solve and analysis structure of incomplete Cholesky to default values.

**Input**

| info       | the pointer to the solve and analysis structure of incomplete Cholesky. |

See *cusparseStatus_t* for the description of the return status.

### 6.18. cusparseDestroyCsric02Info()

**cusparseStatus_t cusparseDestroyCsric02Info(csric02Info_t info);**

This function destroys and releases any memory required by the structure.

**Input**

| info       | the pointer to the solve and analysis structure of (csric02_analysis) |
See \texttt{cusparseStatus_t} for the description of the return status

6.19. \texttt{cusparseCreateCsrilu02Info()}

\begin{verbatim}
cusparseStatus_t
cusparseCreateCsrilu02Info(csrilu02Info_t *info);
\end{verbatim}

This function creates and initializes the solve and analysis structure of incomplete LU to \textit{default} values.

\textbf{Input}

\begin{tabular}{ |p{6cm}|p{18cm}| }
\hline
info & the pointer to the solve and analysis structure of incomplete LU. \\
\hline
\end{tabular}

See \texttt{cusparseStatus_t} for the description of the return status

6.20. \texttt{cusparseDestroyCsrilu02Info()}

\begin{verbatim}
cusparseStatus_t
cusparseDestroyCsrilu02Info(csrilu02Info_t info);
\end{verbatim}

This function destroys and releases any memory required by the structure.

\textbf{Input}

\begin{tabular}{ |p{6cm}|p{18cm}| }
\hline
info & the solve (csrilu02_solve) and analysis (csrilu02_analysis) structure. \\
\hline
\end{tabular}

See \texttt{cusparseStatus_t} for the description of the return status

6.21. \texttt{cusparseCreateBsrsv2Info()}

\begin{verbatim}
cusparseStatus_t
cusparseCreateBsrsv2Info(bsrsv2Info_t *info);
\end{verbatim}

This function creates and initializes the solve and analysis structure of bsrsv2 to \textit{default} values.

\textbf{Input}

\begin{tabular}{ |p{6cm}|p{18cm}| }
\hline
info & the pointer to the solve and analysis structure of bsrsv2. \\
\hline
\end{tabular}

See \texttt{cusparseStatus_t} for the description of the return status

6.22. \texttt{cusparseDestroyBsrsv2Info()}

\begin{verbatim}
cusparseStatus_t
\end{verbatim}

\texttt{cusparseStatus_t}
**6.23. cusparseCreateBsrsm2Info()**

```c
 cusparseStatus_t
 cusparseCreateBsrsm2Info(bsrsm2Info_t *info);
```

This function creates and initializes the solve and analysis structure of bsrsm2 to *default* values.

**Input**

| info          | the pointer to the solve and analysis structure of bsrsm2. |

See [cusparseStatus_t](#) for the description of the return status

---

**6.24. cusparseDestroyBsrsm2Info()**

```c
 cusparseStatus_t
 cusparseDestroyBsrsm2Info(bsrsm2Info_t info);
```

This function destroys and releases any memory required by the structure.

**Input**

| info          | the solve (bsrsm2_solve) and analysis (bsrsm2_analysis) structure. |

See [cusparseStatus_t](#) for the description of the return status

---

**6.25. cusparseCreateBsric02Info()**

```c
 cusparseStatus_t
 cusparseCreateBsric02Info(bsric02Info_t *info);
```

This function creates and initializes the solve and analysis structure of block incomplete Cholesky to *default* values.

**Input**

| info          | the pointer to the solve and analysis structure of block incomplete Cholesky. |

---
See \texttt{cusparseStatus\_t} for the description of the return status

6.26. \texttt{cusparseDestroyBsric02Info()}

\begin{verbatim}
cusparseStatus_t
cusparseDestroyBsric02Info(bsric02Info_t info);
\end{verbatim}

This function destroys and releases any memory required by the structure.

\textbf{Input}

| info    | the solve (bsric02\_solve) and analysis (bsric02\_analysis) structure. |

See \texttt{cusparseStatus\_t} for the description of the return status

6.27. \texttt{cusparseCreateBsrilu02Info()}

\begin{verbatim}
cusparseStatus_t
cusparseCreateBsrilu02Info(bsrilu02Info_t *info);
\end{verbatim}

This function creates and initializes the solve and analysis structure of block incomplete LU to \textit{default} values.

\textbf{Input}

| info    | the pointer to the solve and analysis structure of block incomplete LU. |

See \texttt{cusparseStatus\_t} for the description of the return status

6.28. \texttt{cusparseDestroyBsrilu02Info()}

\begin{verbatim}
cusparseStatus_t
cusparseDestroyBsrilu02Info(bsrilu02Info_t info);
\end{verbatim}

This function destroys and releases any memory required by the structure.

\textbf{Input}

| info    | the solve (bsrilu02\_solve) and analysis (bsrilu02\_analysis) structure. |

See \texttt{cusparseStatus\_t} for the description of the return status
6.29.  cusparseCreateCsrgemm2Info()  
[DEPRECATED]

[[DEPRECATED]]  *The routine will be removed in the next major release*

```c
cusparseStatus_t
cusparseCreateCsrgemm2Info(csrgemm2Info_t *info);
```

This function creates and initializes analysis structure of general sparse matrix-matrix multiplication.

**Input**

| info            | the pointer to the analysis structure of general sparse matrix-matrix multiplication. |

See `cusparseStatus_t` for the description of the return status

---

6.30.  cusparseDestroyCsrgemm2Info()  
[DEPRECATED]

[[DEPRECATED]]  *The routine will be removed in the next major release*

```c
cusparseStatus_t
cusparseDestroyCsrgemm2Info(csrgemm2Info_t info);
```

This function destroys and releases any memory required by the structure.

**Input**

| info            | opaque structure of csrgemm2. |

See `cusparseStatus_t` for the description of the return status

---

6.31.  cusparseCreatePruneInfo()  

```c
cusparseStatus_t
cusparseCreatePruneInfo(pruneInfo_t *info);
```

This function creates and initializes structure of `prune` to `default` values.

**Input**

| info            | the pointer to the structure of `prune`. |

See `cusparseStatus_t` for the description of the return status
6.32. cusparseDestroyPruneInfo()

cusparseStatus_t
cusparseDestroyPruneInfo(pruneInfo_t info);

This function destroys and releases any memory required by the structure.

Input

| info       | the structure of prune. |

See cusparseStatus_t for the description of the return status.
This chapter describes sparse linear algebra functions that perform operations between dense and sparse vectors.

7.1.  `cusparse<t>axpyi()` [DEPRECATED]

[DEPRECATED] use `cusparseAxpy()` instead. The routine will be removed in the next major release.

```c
usparseStatus_t cusparseSaxpyi(cusparseHandle_t handle, int nnz, const float* alpha, const float* xVal, const int* xInd, float* y, cusparseIndexBase_t idxBase)
cusparseStatus_t cusparseDaxpyi(cusparseHandle_t handle, int nnz, const double* alpha, const double* xVal, const int* xInd, double* y, cusparseIndexBase_t idxBase)
cusparseStatus_t cusparseCaxpyi(cusparseHandle_t handle, int nnz, const cuComplex* alpha, const cuComplex* xVal, const int* xInd, cuComplex* y, cusparseIndexBase_t idxBase)
cusparseStatus_t cusparseZaxpyi(cusparseHandle_t handle, int nnz, const cuDoubleComplex* alpha, const cuDoubleComplex* xVal, cuDoubleComplex* y, cusparseIndexBase_t idxBase)
```
This function multiplies the vector $x$ in sparse format by the constant $\alpha$ and adds the result to the vector $y$ in dense format. This operation can be written as

$$y = y + \alpha \times x$$

In other words,

\[
y[x\text{Ind}[i]-\text{idxBase}] = y[x\text{Ind}[i]-\text{idxBase}] + \alpha \times \text{xVal}[i]
\]

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>nnz</td>
<td>number of elements in vector $x$.</td>
</tr>
<tr>
<td>alpha</td>
<td>$&lt;$type&gt; scalar used for multiplication.</td>

</tbody>
</table>

**Output**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>$&lt;$type&gt; updated vector in dense format (that is unchanged if nnz == 0).</td>
</tr>
</tbody>
</table>

See **cusparseStatus_t** for the description of the return status

### 7.2. cusparse<t>gthr() [DEPRECATED]

[[DEPRECATED]] use **cusparseGather()** instead. *The routine will be removed in the next major release*

```c
        const int* xInd,
        cuDoubleComplex* y,
        cusparseIndexBase_t idxBase)
```

```c
        int
        const float* y,
        float* xVal,
        const int* xInd,
        cusparseIndexBase_t idxBase)
```

```c
        int
        nnz,
```
const double* y,
double* xVal,
const int* xInd,
cusparseIndexBase_t idxBase)

This function gathers the elements of the vector y listed in the index array xInd into the data array xVal.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>handle</th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnz</td>
<td>number of elements in vector x.</td>
</tr>
<tr>
<td>y</td>
<td>&lt;type&gt; vector in dense format [of</td>
</tr>
<tr>
<td></td>
<td>size=max(xInd)-idxBase+1].</td>
</tr>
<tr>
<td>xInd</td>
<td>integer vector with nnz indices of the nonzero values of vector x.</td>
</tr>
<tr>
<td>idxBase</td>
<td>CUSPARSE_INDEX_BASE_ZERO OR</td>
</tr>
<tr>
<td></td>
<td>CUSPARSE_INDEX_BASE_ONE.</td>
</tr>
</tbody>
</table>

**Output**

| xVal         | <type> vector with nnz nonzero values that were gathered from vector y [that is unchanged if nnz == 0]. |

See **cusparseStatus_t** for the description of the return status

### 7.3. cusparse<t>gthrz() [DEPRECATED]

[[DEPRECATED]] use **cusparseGather()** instead. *The routine will be removed in the next major release*

}
cusparseStatus_t
This function gathers the elements of the vector \( y \) listed in the index array \( x\text{Ind} \) into the data array \( x\text{Val} \). Also, it zeros out the gathered elements in the vector \( y \).

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

### Input

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>nnz</td>
<td>number of elements in vector ( x ).</td>
</tr>
<tr>
<td>y</td>
<td>(&lt;\text{type}&gt;) vector in dense format [of size≥(\text{max}(x\text{Ind})-\text{idxBase}+1)].</td>
</tr>
<tr>
<td>xInd</td>
<td>integer vector with ( \text{nnz} ) indices of the nonzero values of vector ( x ).</td>
</tr>
<tr>
<td>idxBase</td>
<td>( \text{CUSPARSE_INDEX_BASE_ZERO} ) or ( \text{CUSPARSE_INDEX_BASE_ONE} ).</td>
</tr>
</tbody>
</table>

### Output

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xVal</td>
<td>(&lt;\text{type}&gt;) vector with ( \text{nnz} ) nonzero values that were gathered from vector ( y ) [that is unchanged if ( \text{nnz} == 0 )].</td>
</tr>
</tbody>
</table>
y  <type> vector in dense format with elements indexed by xInd set to zero (it is unchanged if nnz == 0).

See cusparseStatus_t for the description of the return status.

7.4. cusparse<t>roti() [DEPRECATED]

[DEPRECATED] use cusparseRot() instead. The routine will be removed in the next major release.

cusparseStatus_t cusparseSroti(cusparseHandle_t handle,
  int nnz,
  float* xVal,
  const int* xInd,
  float* y,
  const float* c,
  const float* s,
  cusparseIndexBase_t idxBase)

cusparseStatus_t cusparseDroti(cusparseHandle_t handle,
  int nnz,
  double* xVal,
  const int* xInd,
  double* y,
  const double* c,
  const double* s,
  cusparseIndexBase_t idxBase)

This function applies the Givens rotation matrix

\[ G = \begin{pmatrix} c & s \\ -s & c \end{pmatrix} \]

to sparse x and dense y vectors. In other words,

for i=0 to nnz-1

\[
\begin{align*}
  y[xInd[i]-idxBase] &= c \cdot y[xInd[i]-idxBase] - s \cdot xVal[i] \\
  x[i] &= c \cdot xVal[i] + s \cdot y[xInd[i]-idxBase]
\end{align*}
\]

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

Input

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>nnz</td>
<td>number of elements in vector x.</td>
</tr>
<tr>
<td>xVal</td>
<td>&lt;type&gt; vector with nnz nonzero values of vector x.</td>
</tr>
<tr>
<td>xInd</td>
<td>integer vector with nnz indices of the nonzero values of vector x.</td>
</tr>
<tr>
<td>y</td>
<td>&lt;type&gt; vector in dense format.</td>
</tr>
</tbody>
</table>
c

| cosine element of the rotation matrix. |
| s

| sine element of the rotation matrix. |
| idxBase

| CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE. |

**Output**

| xVal | <type> updated vector in sparse format [that is unchanged if nnz == 0]. |
| y   | <type> updated vector in dense format [that is unchanged if nnz == 0]. |

See **cusparseStatus_t** for the description of the return status.

### 7.5. cusparse<t>sctr() [DEPRECATED]

[[DEPRECATED]] use **cusparseScatter()** instead. *The routine will be removed in the next major release.*

```c

cusparseStatus_t cusparseSsctr(cusparseHandle_t handle,
int nnz,
const float* xVal,
const int* xInd,
float* y,
cusparseIndexBase_t idxBase)

cusparseStatus_t cusparseDsctr(cusparseHandle_t handle,
int nnz,
const double* xVal,
const int* xInd,
double* y,
cusparseIndexBase_t idxBase)

cusparseStatus_t cusparseCsctr(cusparseHandle_t handle,
int nnz,
const cuComplex* xVal,
const int* xInd,
cuComplex* y,
cusparseIndexBase_t idxBase)

cusparseStatus_t cusparseZsctr(cusparseHandle_t handle,
int nnz,
const cuDoubleComplex* xVal,
const int* xInd,
cuDoubleComplex* y,
cusparseIndexBase_t idxBase)
```

This function scatters the elements of the vector x in sparse format into the vector y in dense format. It modifies only the elements of y whose indices are listed in the array xInd.

- The routine requires no extra storage.
The routine supports asynchronous execution
The routine supports CUDA graph capture

**Input**

<p>| | |</p>

<td><strong>y</strong></td>
<td>&lt;type&gt; vector with nnz nonzero values that were scattered from vector x (that is unchanged if nnz == 0).</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status.
This chapter describes the sparse linear algebra functions that perform operations between sparse matrices and dense vectors.

In particular, the solution of sparse triangular linear systems is implemented in two phases. First, during the analysis phase, the sparse triangular matrix is analyzed to determine the dependencies between its elements by calling the appropriate `csrsv2_analysis()` function. The analysis is specific to the sparsity pattern of the given matrix and to the selected `cusparseOperation_t` type. The information from the analysis phase is stored in the parameter of type `csrsv2Info_t` that has been initialized previously with a call to `cusparseCreateCsrsv2Info()`.

Second, during the solve phase, the given sparse triangular linear system is solved using the information stored in the `csrsv2Info_t` parameter by calling the appropriate `csrsv2_solve()` function. The solve phase may be performed multiple times with different right-hand sides, while the analysis phase needs to be performed only once. This is especially useful when a sparse triangular linear system must be solved for a set of different right-hand sides one at a time, while its coefficient matrix remains the same.

Finally, once all the solves have completed, the opaque data structure pointed to by the `csrsv2Info_t` parameter can be released by calling `cusparseDestroyCsrsv2Info()`.

### 8.1. `cusparse<t>bsrmv()`

```c
cusparseStatus_t
cusparseBsrmv(cusparseHandle_t handle,
cusparseDirection_t dir,
cusparseOperation_t trans,
int mb,
int nb,
int nnzb,
const float* alpha,
const cusparseMatDescr_t descr,
const float* bsrVal,
const int* bsrRowPtr,
const int* bsrColInd,
int blockDim,
const float* x,
const float* beta,
```
This function performs the matrix-vector operation

\[ y = \alpha \cdot \text{op}(A) \cdot x + \beta \cdot y \]

where \( A \) is an \((mb \times blockDim) \times (nb \times blockDim)\) sparse matrix that is defined in BSR storage format by the three arrays \( bsrVal, bsrRowPtr, \) and \( bsrColInd\); \( x \) and \( y \) are vectors; \( \alpha \) and \( \beta \) are scalars; and
bsrmv() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

Several comments on bsrmv():

- Only `blockDim > 1` is supported
- Only `CUSPARSE_OPERATION_NON_TRANSPOSE` is supported, that is
  \[ y = \alpha \times A \times x + \beta \times y \]
- Only `CUSPARSE_MATRIX_TYPE_GENERAL` is supported.

The size of vector `x` should be \((nb \times blockDim)\) at least, and the size of vector `y` should be \((mb \times blockDim)\) at least; otherwise, the kernel may return `CUSPARSE_STATUS_EXECUTION_FAILED` because of an out-of-bounds array.

For example, suppose the user has a CSR format and wants to try `bsrmv()`, the following code demonstrates how to use `csr2bsr()` conversion and `bsrmv()` multiplication in single precision.

```c
// Suppose that A is m x n sparse matrix represented by CSR format,
// hx is a host vector of size n, and hy is also a host vector of size m.
// m and n are not multiple of blockDim.
// step 1: transform CSR to BSR with column-major order
int base, nnz;
int nnzb;
cusparseDirection_t dirA = CUSPARSE_DIRECTION_COLUMN;
int mb = (m + blockDim-1)/blockDim;
int nb = (n + blockDim-1)/blockDim;
cudaMalloc((void**)&bsrRowPtrC, sizeof(int) *(mb+1));
cusparseXcsr2bsrNnz(handle, dirA, m, n,
    descrA, csrRowPtrA, csrColIndA, blockDim,
    descrC, bsrRowPtrC, &nnzb);
cudaMalloc((void**)&bsrColIndC, sizeof(int)*nnzb);
cudaMalloc((void**)&bsrValC, sizeof(float)*(blockDim*blockDim)*nnzb);
cusparseScsr2bsr(handle, dirA, m, n,
    descrA, csrValA, csrRowPtrA, csrColIndA, blockDim,
    descrC, bsrValC, bsrRowPtrC, bsrColIndC);
// step 2: allocate vector x and vector y large enough for bsrmv
cudaMalloc((void**)&x, sizeof(float)*(nb*blockDim));
cudaMalloc((void**)&y, sizeof(float)*(mb*blockDim));
cudaMemcpy(x, hx, sizeof(float)*n, cudaMemcpyHostToDevice);
cudaMemcpy(y, hy, sizeof(float)*m, cudaMemcpyHostToDevice);
// step 3: perform bsrmv
cusparseSbsrmv(handle, dirA, transA, mb, nb, nnzb, &alpha,
    descrC, bsrValC, bsrRowPtrC, bsrColIndC, blockDim, x, &beta, y);
```

**Input**

<td><code>&lt;type&gt;</code> scalar used for multiplication. If $\text{beta}$ is zero, $y$ does not have to be a valid input.</td>
</tr>
<tr>
<td>y</td>
<td><code>&lt;type&gt;</code> vector of $\text{mb} \times \text{blockDim}$ elements.</td>
</tr>
</tbody>
</table>

**Output**

$y$ 

`<type>` updated vector.

See `cusparseStatus_t` for the description of the return status.

### 8.2. `cusparse<t>bsrXmv()`

```
cusparseStatus_t cusparseSbsrXmv(cusparseHandle_t handle, 
cusparseDirection_t dir, 
cusparseOperation_t trans, 
int sizeOfMask, 
int mb, 
int nb, 
int nnzb, 
const float* alpha, 
const cusparseMatDescr_t descr, 
const float* bsrVal, 
const int* bsrMaskPtr, 
const int* bsrRowPtr, 
```
const int* bsrEndPtr,
const int* bsrColInd,
int blockDim,
const float* x,
const float* beta,
float* y)
cusparseStatus_t

cusparseDbsrxmv(cusparseHandle_t handle,
cusparseDirection_t dir,
cusparseOperation_t trans,
int mb,
int nb,
int nnzb,
const double* alpha,
const cusparseMatDescr_t descr,
const double* bsrVal,
const int* bsrMaskPtr,
const int* bsrRowPtr,
const int* bsrEndPtr,
int blockDim,
const double* x,
const double* beta,
double* y)
cusparseStatus_t

cusparseCbsrxmv(cusparseHandle_t handle,
cusparseDirection_t dir,
cusparseOperation_t trans,
int mb,
int nb,
int nnzb,
const cuComplex* alpha,
const cusparseMatDescr_t descr,
const cuComplex* bsrVal,
const int* bsrMaskPtr,
const int* bsrRowPtr,
const int* bsrEndPtr,
int blockDim,
const cuComplex* x,
const cuComplex* beta,
cuComplex* y)
cusparseStatus_t

cusparseZbsrxmv(cusparseHandle_t handle,
cusparseDirection_t dir,
cusparseOperation_t trans,
int mb,
int nb,
int nnzb,
const cuDoubleComplex* alpha,
const cusparseMatDescr_t descr,
const cuDoubleComplex* bsrVal,
const int* bsrMaskPtr,
const int* bsrRowPtr,
const int* bsrEndPtr,
This function performs a \texttt{bsrmv} and a mask operation

\[
y(\text{mask}) = (\alpha \ast \text{op}(A) \ast x + \beta \ast y)(\text{mask})
\]

where \(A\) is an \((mb \times blockDim) \times (nb \times blockDim)\) sparse matrix that is defined in BSRX storage format by the four arrays \texttt{bsrVal}, \texttt{bsrRowPtr}, \texttt{bsrEndPtr}, and \texttt{bsrColInd}; \(x\) and \(y\) are vectors; \(\alpha\) and \(\beta\) are scalars; and

\[
\text{op}(A) = \begin{cases} A & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\ A^T & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\ A^H & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE} \end{cases}
\]

The mask operation is defined by array \texttt{bsrMaskPtr} which contains updated block row indices of \(y\). If row \(i\) is not specified in \texttt{bsrMaskPtr}, then \texttt{bsrmv()} does not touch row block \(i\) of \(A\) and \(y\).

For example, consider the 2\times 3 block matrix \(A\):

\[
A = \begin{bmatrix} A_{11} & A_{12} & O \\ A_{21} & A_{22} & A_{23} \end{bmatrix}
\]

and its one-based BSR format (three vector form) is

\[
\begin{align*}
\texttt{bsrVal} &= [A_{11} \ A_{12} \ A_{21} \ A_{22} \ A_{23}] \\
\texttt{bsrRowPtr} &= [1 \ 3 \ 6] \\
\texttt{bsrColInd} &= [1 \ 2 \ 1 \ 2 \ 3]
\end{align*}
\]

Suppose we want to do the following \texttt{bsrmv} operation on a matrix \(\bar{A}\) which is slightly different from \(A\).

\[
\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \alpha \ast \left( \begin{bmatrix} O & O & O \\ O & A_{22} & O \end{bmatrix} \right) \ast \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \beta \ast y(\text{mask})
\]

We don’t need to create another BSR format for the new matrix \(\bar{A}\), all that we should do is to keep \texttt{bsrVal} and \texttt{bsrColInd} unchanged, but modify \texttt{bsrRowPtr} and add an additional array \texttt{bsrEndPtr} which points to the last nonzero elements per row of \(\bar{A}\) plus 1.

For example, the following \texttt{bsrRowPtr} and \texttt{bsrEndPtr} can represent matrix \(\bar{A}\):

\[
\begin{align*}
\texttt{bsrRowPtr} &= [1 \ 4] \\
\texttt{bsrEndPtr} &= [1 \ 5]
\end{align*}
\]

Further we can use a mask operator (specified by array \texttt{bsrMaskPtr}) to update particular block row indices of \(y\) only because \(y_1\) is never changed. In this case, \texttt{bsrMaskPtr} = [2] and \texttt{sizeOfMask}=1.

The mask operator is equivalent to the following operation:
\[
\begin{bmatrix}
? \\
y_2
\end{bmatrix} := \alpha \begin{bmatrix}
? & ? & ? \\
O & A_{22} & O
\end{bmatrix} \begin{bmatrix}
x_1 \\
x_2 \\
x_3
\end{bmatrix} + \beta \begin{bmatrix}
? \\
y_2
\end{bmatrix}
\]

If a block row is not present in the `bsrMaskPtr`, then no calculation is performed on that row, and the corresponding value in `y` is unmodified. The question mark “?” is used to indicate row blocks not in `bsrMaskPtr`.

In this case, first row block is not present in `bsrMaskPtr`, so `bsrRowPtr[0]` and `bsrEndPtr[0]` are not touched also.

\[
\begin{align*}
\text{bsrRowPtr} & = \begin{bmatrix} ? & 4 \end{bmatrix} \\
\text{bsrEndPtr} & = \begin{bmatrix} ? & 5 \end{bmatrix}
\end{align*}
\]

`bsrXmv()` has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

A couple of comments on `bsrXmv()`:

- Only `blockDim > 1` is supported
- Only `CUSPARSE_OPERATION_NON_TRANSPOSE` and `CUSPARSE_MATRIX_TYPE_GENERAL` are supported.
- Parameters `bsrMaskPtr`, `bsrRowPtr`, `bsrEndPtr` and `bsrColInd` are consistent with base index, either one-based or zero-based. The above example is one-based.

### Input

bsrMaskPtr integer array of sizeOfMask elements that contains the indices corresponding to updated block rows.

bsrRowPtr integer array of mb elements that contains the start of every block row.

bsrEndPtr integer array of mb elements that contains the end of the every block row plus one.

bsrColInd integer array of nnzb column indices of the nonzero blocks of matrix A.

blockDim block dimension of sparse matrix A, larger than zero.

x <type> vector of mb * blockDim elements.

beta <type> scalar used for multiplication. If beta is zero, y does not have to be a valid input.

y <type> vector of mb * blockDim elements.

See cusparseStatus_t for the description of the return status

8.3. cusparse<t>bsrsv2_bufferSize()

cusparseStatus_t cusparseSbsrsv2_bufferSize(cusparseHandle_t handle, cusparseDirection_t dirA, cusparseOperation_t transA, int mb, int nnzb, const cusparseMatDescr_t descrA, float* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, bsrsv2Info_t info, int* pBufferSizeInBytes)

cusparseStatus_t cusparseDbsrsv2_bufferSize(cusparseHandle_t handle, cusparseDirection_t dirA, cusparseOperation_t transA, int mb, int nnzb, const cusparseMatDescr_t descrA, double* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, bsrsv2Info_t info, int* pBufferSizeInBytes)

cusparseStatus_t cusparseCbsrsv2_bufferSize(cusparseHandle_t handle, cusparseDirection_t dirA, cusparseOperation_t transA, int mb, int nnzb, const cusparseMatDescr_t descrA, cuComplex* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, bsrsv2Info_t info, int* pBufferSizeInBytes)
This function returns size of the buffer used in bsrsv2, a new sparse triangular linear system \( \text{op}(A) \cdot y = \alpha \cdot x \).

\( A \) is an \((mb \cdot \text{blockDim}) \times (mb \cdot \text{blockDim})\) sparse matrix that is defined in BSR storage format by the three arrays bsrValA, bsrRowPtrA, and bsrColIndA; \( x \) and \( y \) are the right-hand-side and the solution vectors; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{trans} == \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if } \text{trans} == \text{CUSPARSE_OPERATION_TRANSPOSE} \\
A^H & \text{if } \text{trans} == \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} 
\end{cases}
\]

Although there are six combinations in terms of parameter \( \text{trans} \) and the upper (lower) triangular part of \( A \), bsrsv2_bufferSize() returns the maximum size buffer among these combinations. The buffer size depends on the dimensions \( mb \), \( \text{blockDim} \), and the number of nonzero blocks of the matrix \( nnzb \). If the user changes the matrix, it is necessary to call bsrsv2_bufferSize() again to have the correct buffer size; otherwise a segmentation fault may occur.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

8.4. cusparse<t>bsrsv2_analysis()

cusparseStatus_t

cusparseSbsrsv2_analysis(cusparseHandle_t handle,
cusparseDirection_t dirA,
cusparseOperation_t transA,
int mb,
int nnzb,
const cusparseMatDescr_t descrA,
const float* bsrValA,
const int* bsrRowPtrA,
const int* bsrColIndA,
bsrsv2Info_t info,
cusparseSolvePolicy_t policy,
void* pBuffer)

cusparseStatus_t

cusparseDbcsrsv2_analysis(cusparseHandle_t handle,
cusparseDirection_t dirA,
cusparseOperation_t transA,
int mb,
int nnzb,
const cusparseMatDescr_t descrA,
const double* bsrValA,
const int* bsrRowPtrA,
const int* bsrColIndA,
This function performs the analysis phase of \( \text{bsrsv2} \), a new sparse triangular linear system
\[ \text{op}(A) \cdot y = \alpha \cdot x. \]

\( A \) is an \((mb \cdot \text{blockDim}) \times (mb \cdot \text{blockDim})\) sparse matrix that is defined in BSR storage format by the three arrays \( \text{bsrValA} \), \( \text{bsrRowPtrA} \), and \( \text{bsrColIndA} \); \( x \) and \( y \) are the right-hand side and the solution vectors; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE} 
\end{cases}
\]

The block of BSR format is of size \( \text{blockDim} \times \text{blockDim} \), stored as column-major or row-major as determined by parameter \( \text{dirA} \), which is either \text{CUSPARSE\_DIRECTION\_COLUMN} or \text{CUSPARSE\_DIRECTION\_ROW}. The matrix type must be \text{CUSPARSE\_MATRIX\_TYPE\_GENERAL}, and the fill mode and diagonal type are ignored.

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a buffer size returned by \( \text{bsrsv2\_bufferSize()} \). The address of \( \text{pBuffer} \) must be multiple of 128 bytes. If it is not, \text{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Function \( \text{bsrsv2\_analysis()} \) reports a structural zero and computes level information, which stored in the opaque structure \( \text{info} \). The level information can extract more parallelism.
for a triangular solver. However `bsrsv2_solve()` can be done without level information. To disable level information, the user needs to specify the policy of the triangular solver as `CUSPARSE_SOLVE_POLICY_NO_LEVEL`.

Function `bsrsv2_analysis()` always reports the first structural zero, even when parameter `policy` is `CUSPARSE_SOLVE_POLICY_NO_LEVEL`. No structural zero is reported if `CUSPARSE_DIAG_TYPE_UNIT` is specified, even if block $A(j,j)$ is missing for some $j$. The user needs to call `cusparseXbsrsv2_zeroPivot()` to know where the structural zero is.

It is the user’s choice whether to call `bsrsv2_solve()` if `bsrsv2_analysis()` reports a structural zero. In this case, the user can still call `bsrsv2_solve()`, which will return a numerical zero at the same position as a structural zero. However the result $x$ is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

Output

| info                      | structure filled with information collected during the analysis phase [that should be passed to the solve phase unchanged]. |

See `cusparseStatus_t` for the description of the return status.

### 8.5. `cusparse<t>bsrsv2_solve()`

```c
cusparse<t>bsrsv2_solve(cusparseHandle_t handle, 
cusparseDirection_t dirA, 
cusparseOperation_t transA, 
int mb, 
int nnzb, 
const float* alpha, 
const cusparseMatDescr_t descrA, 
const float* bsrValA, 
const int* bsrRowPtrA, 
const int* bsrColIndA, 
int blockDim, 
bsrsv2Info_t info, 
const float* x, 
const float* y, 
cusparseSolvePolicy_t policy, 
void* pBuffer)
```

```c
cusparse<t>bsrsv2_solve(cusparseHandle_t handle, 
cusparseDirection_t dirA, 
cusparseOperation_t transA, 
int mb, 
int nnzb, 
const double* alpha, 
const cusparseMatDescr_t descrA, 
const double* bsrValA, 
const int* bsrRowPtrA, 
const int* bsrColIndA, 
int blockDim, 
bsrsv2Info_t info, 
const double* x, 
const double* y, 
cusparseSolvePolicy_t policy, 
void* pBuffer)
```

```c
cusparse<t>bsrsv2_solve(cusparseHandle_t handle, 
cusparseDirection_t dirA, 
cusparseOperation_t transA, 
int mb, 
int nnzb, 
const cuComplex* alpha, 
const cusparseMatDescr_t descrA, 
const cuComplex* bsrValA, 
const int* bsrRowPtrA, 
const int* bsrColIndA, 
int blockDim, 
bsrsv2Info_t info, 
const cuComplex* x, 
const cuComplex* y, 
cusparseSolvePolicy_t policy, 
void* pBuffer)
```
This function performs the solve phase of `bsrsv2`, a new sparse triangular linear system \( \text{op}(A) \cdot y = \alpha \cdot x \).

\( A \) is an \( (mb \times \text{blockDim}) \times (mb \times \text{blockDim}) \) sparse matrix that is defined in BSR storage format by the three arrays `bsrValA`, `bsrRowPtrA`, and `bsrColIndA`; \( x \) and \( y \) are the right-hand-side and the solution vectors; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{trans} = \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if } \text{trans} = \text{CUSPARSE_OPERATION_TRANSPOSE} \\
A^H & \text{if } \text{trans} = \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE}
\end{cases}
\]

The block in BSR format is of size `blockDim`*`blockDim`, stored as column-major or row-major as determined by parameter `dirA`, which is either `CUSPARSE_DIRECTION_COLUMN` or `CUSPARSE_DIRECTION_ROW`. The matrix type must be `CUSPARSE_MATRIX_TYPE_GENERAL`, and the fill mode and diagonal type are ignored. Function `bsrsv02_solve()` can support an arbitrary `blockDim`.

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires a buffer size returned by `bsrsv2_bufferSize()`. The address of `pBuffer` must be multiple of 128 bytes. If it is not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Although `bsrsv2_solve()` can be done without level information, the user still needs to be aware of consistency. If `bsrsv2_analysis()` is called with policy `CUSPARSE_SOLVE_POLICY_USE_LEVEL`, `bsrsv2_solve()` can be run with or without levels. On the other hand, if `bsrsv2_analysis()` is called with `CUSPARSE_SOLVE_POLICY_NO_LEVEL`, `bsrsv2_solve()` can only accept `CUSPARSE_SOLVE_POLICY_NO_LEVEL`; otherwise, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

The level information may not improve the performance, but may spend extra time doing analysis. For example, a tridiagonal matrix has no parallelism.
In this case, CUSPARSE_SOLVE_POLICY_NO_LEVEL performs better than CUSPARSE_SOLVE_POLICY_USE_LEVEL. If the user has an iterative solver, the best approach is to do bsrsv2_analysis() with CUSPARSE_SOLVE_POLICY_USE_LEVEL once. Then do bsrsv2_solve() with CUSPARSE_SOLVE_POLICY_NO_LEVEL in the first run, and with CUSPARSE_SOLVE_POLICY_USE_LEVEL in the second run, and pick the fastest one to perform the remaining iterations.

Function bsrsv02_solve() has the same behavior as csrsv02_solve(). That is, bsr2csr(bsrsv02(A)) = csrsv02(bsr2csr(A)). The numerical zero of csrsv02_solve() means there exists some zero A(j,j). The numerical zero of bsrsv02_solve() means there exists some block A(j,j) that is not invertible.

Function bsrsv2_solve() reports the first numerical zero, including a structural zero. No numerical zero is reported if CUSPARSE_DIAG_TYPE_UNIT is specified, even if A(j,j) is not invertible for some j. The user needs to call cusparseXbsrsv2_zeroPivot() to know where the numerical zero is.

The function supports the following properties if pBuffer != NULL

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

For example, suppose L is a lower triangular matrix with unit diagonal, then the following code solves L*y=x by level information.

```c
// Suppose that L is m x m sparse matrix represented by BSR format,  
// The number of block rows/columns is mb, and  
// the number of nonzero blocks is nnzb.  
// L is lower triangular with unit diagonal.  
// Assumption:  
// - dimension of matrix L is m(mb*blockDim),  
// - matrix L has nnz(nnzb*blockDim*blockDim) nonzero elements,  
// - handle is already created by cusparseCreate(),  
// - (d_bsrRowPtr, d_bsrColInd, d_bsrVal) is BSR of L on device memory,  
// - d_x is right hand side vector on device memory.  
// - d_y is solution vector on device memory.  
// - d_x and d_y are of size m.  

cusparseMatDescr_t descr = 0;  
bcsrsv2Info_t info = 0;  
int pBufferSize;  
void *pBuffer = 0;  
int structural_zero;  
int numerical_zero;  
const double alpha = 1.;  
const cusparseSolvePolicy_t policy = CUSPARSE_SOLVE_POLICY_USE_LEVEL;  
const cusparseOperation_t trans = CUSPARSE_OPERATION_NON_TRANSPOSE;  
const cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;

// step 1: create a descriptor which contains  
// - matrix L is base-1  
// - matrix L is lower triangular  
// - matrix L has unit diagonal, specified by parameter CUSPARSE_DIAG_TYPE_UNIT  
// (L may not have all diagonal elements.)  

cusparseCreateMatDescr(&descr);  
cusparseSetMatIndexBase(descr, CUSPARSE_INDEX_BASE_ONE);  
cusparseSetMatFillMode(descr, CUSPARSE_FILL_MODE_LOWER);  
cusparseSetMatDiagType(descr, CUSPARSE_DIAG_TYPE_UNIT);

// step 2: create a empty info structure
```
cusparseCreateBsrsv2Info(&info);

// step 3: query how much memory used in bsrsv2, and allocate the buffer
cusparseDbsrsv2_bufferSize(handle, dir, trans, mb, nnzb, descr,
    d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, &pBufferSize);

// pBuffer returned by cudaMemcpy is automatically aligned to 128 bytes.
cudaMalloc((void**)&pBuffer, pBufferSize);

// step 4: perform analysis
cusparseDbsrsv2_analysis(handle, dir, trans, mb, nnzb, descr,
    d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim,
    info, policy, pBuffer);

// L has unit diagonal, so no structural zero is reported.
status = cusparseXbsrsv2_zeroPivot(handle, info, &structural_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is missing\n", structural_zero, structural_zero);
}

// step 5: solve L*y = x
cusparseDbsrsv2_solve(handle, dir, trans, mb, nnzb, &alpha, descr,
    d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, info,
    d_x, d_y, policy, pBuffer);

// L has unit diagonal, so no numerical zero is reported.
status = cusparseXbsrsv2_zeroPivot(handle, info, &numerical_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is zero\n", numerical_zero, numerical_zero);
}

// step 6: free resources
cudaFree(pBuffer);
cusparseDestroyBsrsv2Info(info);
cusparseDestroyMatDescr(descr);
cusparseDestroy(handle);

See cusparseStatus_t for the description of the return status.

### 8.6. cusparseXbsrsv2_zeroPivot()

cusparseXbsrsv2_zeroPivot(cusparseHandle_t handle,
bsrsv2Info_t info,
int* position)

If the returned error code is CUSPARSE_STATUS_ZERO_PIVOT, $\text{position}=j$ means $A(j,j)$ is either structural zero or numerical zero (singular block). Otherwise $\text{position}=-1$.

The $\text{position}$ can be 0-based or 1-based, the same as the matrix.

Function cusparseXbsrsv2_zeroPivot() is a blocking call. It calls cudaDeviceSynchronize() to make sure all previous kernels are done.

The $\text{position}$ can be in the host memory or device memory. The user can set the proper mode with cusparseSetPointerMode().

- The routine requires no extra storage
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

Input

<table>
<thead>
<tr>
<th>handle</th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>info</td>
<td>info contains a structural zero or numerical zero if the user already called bsrsv2_analysis() or bsrsv2_solve().</td>
</tr>
</tbody>
</table>

Output
position

if no structural or numerical zero, position is -1; otherwise if A(j,j) is missing or U(j,j) is zero, position=j.

See `cusparseStatus_t` for the description of the return status.

8.7. `cusparseCsrmvEx()` [DEPRECATED]

[[DEPRECATED]] use `cusparseSpMV()` instead. The routine will be removed in the next major release.

```c
 cusparseStatus_t
 cusparseCsrmvEx_bufferSize(cusparseHandle_t handle,
                            cusparseAlgMode_t alg,
                            cusparseOperation_t transA,
                            int m,
                            int n,
                            int nnz,
                            const void* alpha,
                            cudaDataType alphatype,
                            const cusparseMatDescr_t descrA,
                            const void* csrValA,
                            cudaDataType csrValAtype,
                            const int* csrRowPtrA,
                            const int* csrColIndA,
                            const void* x,
                            cudaDataType xtype,
                            const void* beta,
                            cudaDataType betatype,
                            void* y,
                            cudaDataType ytype,
                            cudaDataType executiontype,
                            size_t* bufferSizeInBytes)
```

```c
 cusparseStatus_t
 cusparseCsrmvEx(cusparseHandle_t handle,
                cusparseAlgMode_t alg,
                cusparseOperation_t transA,
                int m,
                int n,
                int nnz,
                const void* alpha,
                cudaDataType alphatype,
                const cusparseMatDescr_t descrA,
                const void* csrValA,
                cudaDataType csrValAtype,
                const int* csrRowPtrA,
                const int* csrColIndA,
                const void* x,
                cudaDataType xtype,
                const void* beta,
                cudaDataType betatype,
                void* y,
                cudaDataType ytype,
                cudaDataType executiontype,
                void* buffer)
```
This function performs the matrix-vector operation

\[ y = \alpha \cdot \text{op}(A) \cdot x + \beta \cdot y \]

\( A \) is an \( m \times n \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \); \( x \) and \( y \) are vectors;

The function \( \text{cusparseCsrmvEx_bufferSize} \) returns the size of the workspace needed by \( \text{cusparseCsrmvEx} \).

The function has the following limitations:

- All pointers should be aligned with 128 bytes
- Only \( \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \) operation is supported
- Only \( \text{CUSPARSE_MATRIX_TYPE_GENERAL} \) matrix type is supported
- Only \( \text{CUSPARSE_INDEX_BASE_ZERO} \) indexing is supported
- Half-precision is not supported
- The minimum GPU architecture supported is SM_53

The function has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input specifically required by \( \text{cusparseCsrmvEx} \)**

8.8.  

**cusparse<t>csrsv2_bufferSize()**

[DEPRECATED]

[[DEPRECATED]] use **cusparseSpSV()** instead. The routine will be removed in the next major release

This function returns the size of the buffer used in `csrsv2`, a new sparse triangular linear system \( \text{op}(A) \cdot y = \alpha x \).
A is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \); \( x \) and \( y \) are the right-hand-side and the solution vectors; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if trans} == \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if trans} == \text{CUSPARSE_OPERATION_TRANSPOSE} \\
A^H & \text{if trans} == \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE}
\end{cases}
\]

Although there are six combinations in terms of the parameter \( \text{trans} \) and the upper (lower) triangular part of \( A \), \( \text{csrsv2_bufferSize()} \) returns the maximum size buffer of these combinations. The buffer size depends on the dimension and the number of nonzero elements of the matrix. If the user changes the matrix, it is necessary to call \( \text{csrsv2_bufferSize()} \) again to have the correct buffer size; otherwise, a segmentation fault may occur.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

</tr>
</tbody>
</table>
This function performs the analysis phase of `csrsv2`, a new sparse triangular linear system \( \text{op}(A) \cdot y = \alpha \cdot x \).

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \); \( x \) and \( y \) are the right-hand-side and the solution vectors; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{trans} == \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if } \text{trans} == \text{CUSPARSE_OPERATION_TRANSPOSE} \\
A^H & \text{if } \text{trans} == \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE}
\end{cases}
\]

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a buffer size returned by `csrsv2_bufferSize()`. The address of \( \text{pBuffer} \) must be multiple of 128 bytes. If it is not, \( \text{CUSPARSE_STATUS_INVALID_VALUE} \) is returned.

Function `csrsv2_analysis()` reports a structural zero and computes level information that is stored in opaque structure `info`. The level information can extract more parallelism for a triangular solver. However `csrsv2_solve()` can be done without level information. To disable level information, the user needs to specify the policy of the triangular solver as `CUSPARSE_SOLVE_POLICY_NO_LEVEL`.

Function `csrsv2_analysis()` always reports the first structural zero, even if the policy is `CUSPARSE_SOLVE_POLICY_NO_LEVEL`. No structural zero is reported if `CUSPARSE_DIAG_TYPE_UNIT` is specified, even if \( A(j,j) \) is missing for some \( j \). The user needs to call `cusparseXcsrsv2_zeroPivot()` to know where the structural zero is.

It is the user’s choice whether to call `csrsv2_solve()` if `csrsv2_analysis()` reports a structural zero. In this case, the user can still call `csrsv2_solve()` which will return a numerical zero in the same position as the structural zero. However the result \( x \) is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

See [cusparseStatus_t](#) for the description of the return status.

### 8.10. `cusparse<t>csrsv2_solve()`

[[DEPRECATED]] use [`cusparseSpSV()`](#) instead. The routine will be removed in the next major release.

```c
 cusparseStatus_t cusparseScsrsv2_solve(cusparseHandle_t handle, cusparseOperation_t transA, int m, int nnz, const float* alpha, const cusparseMatDescr_t descra, const float* csrValA, const int* csrRowPtrA, const int* csrColIndA, csrsv2Info_t info, const float* x, float* y, cusparseSolvePolicy_t policy, void* pBuffer);
```

```c
 cusparseStatus_t cusparseDcsrsv2_solve(cusparseHandle_t handle, cusparseOperation_t transA, int m, int nnz, const double* alpha, const cusparseMatDescr_t descra, const double* csrValA, const double* csrRowPtrA, const double* csrColIndA, csrsv2Info_t info, const double* x, double* y, cusparseSolvePolicy_t policy, void* pBuffer);
```
This function performs the solve phase of \( \text{csrsv2} \), a new sparse triangular linear system
\[
\text{op}(A) \cdot y = \alpha \cdot x.
\]

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \); \( x \) and \( y \) are the right-hand-side and the solution vectors; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if trans} == \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if trans} == \text{CUSPARSE_OPERATION_TRANSPOSE} \\
A^H & \text{if trans} == \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE}
\end{cases}
\]

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires the buffer size returned by \( \text{csrsv2\_bufferSize()} \). The address of \( \text{pBuffer} \) must be multiple of 128 bytes. If it is not, \( \text{CUSPARSE\_STATUS\_INVALID\_VALUE} \) is returned.

Although \( \text{csrsv2\_solve()} \) can be done without level information, the user still needs to be aware of consistency. If \( \text{csrsv2\_analysis()} \) is called with policy
CUSPARSE_SOLVE_POLICY_USE_LEVEL, csrsv2_solve() can be run with or without levels. On the contrary, if csrsv2_analysis() is called with CUSPARSE_SOLVE_POLICY_NO_LEVEL, csrsv2_solve() can only accept CUSPARSE_SOLVE_POLICY_NO_LEVEL; otherwise, CUSPARSE_STATUS_INVALID_VALUE is returned.

The level information may not improve the performance but spend extra time doing analysis. For example, a tridiagonal matrix has no parallelism. In this case, CUSPARSE_SOLVE_POLICY_NO_LEVEL performs better than CUSPARSE_SOLVE_POLICY_USE_LEVEL. If the user has an iterative solver, the best approach is to do csrsv2_analysis() with CUSPARSE_SOLVE_POLICY_USE_LEVEL once. Then do csrsv2_solve() with CUSPARSE_SOLVE_POLICY_NO_LEVEL in the first run and with CUSPARSE_SOLVE_POLICY_USE_LEVEL in the second run, picking faster one to perform the remaining iterations.

Function csrsv2_solve() reports the first numerical zero, including a structural zero. If status is 0, no numerical zero was found. Furthermore, no numerical zero is reported if CUSPARSE_DIAG_TYPE_UNIT is specified, even if $A(j, j)$ is zero for some $j$. The user needs to call cusparseXcsrsv2_zeroPivot() to know where the numerical zero is.

For example, suppose $L$ is a lower triangular matrix with unit diagonal, the following code solves $L \cdot y = x$ by level information.

```c
// Suppose that L is m x m sparse matrix represented by CSR format,
// L is lower triangular with unit diagonal.
// Assumption:
// - dimension of matrix L is m,
// - matrix L has nz number zero elements,
// - handle is already created by cusparseCreate(),
// - (d_csrRowPtr, d_csrColInd, d_csrVal) is CSR of L on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory.

cusparseMatDescr_t descr = 0;
csrsv2Info_t info = 0;
int pBufferSize;
void *pBuffer = 0;
int structural_zero;
int numerical_zero;
const double alpha = 1.;
const cusparseSolvePolicy_t policy = CUSPARSE_SOLVE_POLICY_USE_LEVEL;
const cusparseOperation_t trans = CUSPARSE_OPERATION_NON_TRANSPOSE;

  // step 1: create a descriptor which contains
  // - matrix L is base-1
  // - matrix L is lower triangular
  // - matrix L has unit diagonal, specified by parameter CUSPARSE_DIAG_TYPE_UNIT
  // (L may not have all diagonal elements.)
  cusparseCreateMatDescr(&descr);
  cusparseSetMatIndexBase(descr, CUSPARSE_INDEX_BASE_ONE);
  cusparseSetMatFillMode(descr, CUSPARSE_FILL_MODE_LOWER);
  cusparseSetMatDiagType(descr, CUSPARSE_DIAG_TYPE_UNIT);

  // step 2: create a empty info structure
  cusparseCreateCsrsv2Info(&info);

  // step 3: query how much memory used in csrsv2, and allocate the buffer
  cusparseDcsrsv2_bufferSize(handle, trans, m, nz, descr,
      d_csrVal, d_csrRowPtr, d_csrColInd, info, &pBufferSize);
  // pBuffer returned by cudaMalloc is automatically aligned to 128 bytes.
  cudaMemcpy((void**)&pBuffer, pBuffer, pBufferSize);
```
// step 4: perform analysis
cusparseDcsrsv2_analysis(handle, trans, m, nnz, descr,
    d_csrVal, d_csrRowPtr, d_csrColInd,
    info, policy, pBuffer);
// L has unit diagonal, so no structural zero is reported.
status = cusparseXcsrsv2_zeroPivot(handle, info, &structural_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is missing\n", structural_zero, structural_zero);
}

// step 5: solve L*y = x
 cusparseDcsrsv2_solve(handle, trans, m, nnz, &alpha, descr,
    d_csrVal, d_csrRowPtr, d_csrColInd, info,
    d_x, d_y, policy, pBuffer);
// L has unit diagonal, so no numerical zero is reported.
status = cusparseXcsrsv2_zeroPivot(handle, info, &numerical_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is zero\n", numerical_zero, numerical_zero);
}

// step 6: free resources
cudaFree(pBuffer);
cusparseDestroyCsrsv2Info(info);
cusparseDestroyMatDescr(descr);
cusparseDestroy(handle);

Remark: csrsv2_solve() needs more nonzeros per row to achieve good performance. It
would perform better if more than 16 nonzeros per row in average.

The function supports the following properties if pBuffer != NULL

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

Input

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

</tbody>
</table>
### cusparseXcsrsv2_zeroPivot() [DEPRECATED]

**[DEPRECATED]** use `cusparseSpSV()` instead. *The routine will be removed in the next major release*

```c

cusparseStatus_t cusparseXcsrsv2_zeroPivot(cusparseHandle_t handle, 
                                    csrsv2Info_t info, 
                                    int* position)
```

If the returned error code is CUSPARSE_STATUS_ZERO_PIVOT, position=j means A(j,j) has either a structural zero or a numerical zero. Otherwise position=-1.

The position can be 0-based or 1-based, the same as the matrix.

Function `cusparseXcsrsv2_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.

The position can be in the host memory or device memory. The user can set the proper mode with `cusparseSetPointerMode()`.

- The routine requires no extra storage
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

<td>info contains structural zero or numerical zero if the user already called <code>csrsv2_analysis()</code> or <code>csrsv2_solve()</code>.</td>
</tr>
</tbody>
</table>

### Output
position

| if no structural or numerical zero, position is -1; otherwise, if \( A(j,j) \) is missing or \( U(j,j) \) is zero, position=j.

See `cusparseStatus_t` for the description of the return status

### 8.12. `cusparse<t>gemvi()`

```c
cusparseStatus_t
cusparseSgemvi_bufferSize(cusparseHandle_t    handle,
cusparseOperation_t  transA,
int                  m,
int                  n,
int                  nnz,
int*                pBufferSize)

cusparseStatus_t
cusparseDgemvi_bufferSize(cusparseHandle_t    handle,
cusparseOperation_t  transA,
int                  m,
int                  n,
int                  nnz,
int*                pBufferSize)

cusparseStatus_t
cusparseCgemvi_bufferSize(cusparseHandle_t    handle,
cusparseOperation_t  transA,
int                  m,
int                  n,
int                  nnz,
int*                pBufferSize)

cusparseStatus_t
cusparseZgemvi_bufferSize(cusparseHandle_t    handle,
cusparseOperation_t  transA,
int                  m,
int                  n,
int                  nnz,
int*                pBufferSize)

cusparseStatus_t
cusparseSgemvi(cusparseHandle_t     handle,
cusparseOperation_t  transA,
int                  m,
int                  n,
const float*         alpha,
const float*         A,
int                  lda,
int                  nnz,
const float*         x,
const int*           xInd,
const float*         beta,
float*               y,
cusparseIndexBase_t  idxBase,
void*                pBuffer)
```

```c
cusparseStatus_t
```
This function performs the matrix-vector operation
\[ y = \alpha \cdot \text{op}(A) \cdot x + \beta \cdot y \]

\( A \) is an \( m \times n \) dense matrix and a sparse vector \( x \) that is defined in a sparse storage format by the two arrays \( xVal, xInd \) of length \( nnz \), and \( y \) is a dense vector; \( \alpha \) and \( \beta \) are scalars; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{trans} == \text{CU SPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if } \text{trans} == \text{CU SPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if } \text{trans} == \text{CU SPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases}
\]

To simplify the implementation, we have not (yet) optimized the transpose multiple case. We recommend the following for users interested in this case.
1. Convert the matrix from CSR to CSC format using one of the `csr2csc()` functions. Notice that by interchanging the rows and columns of the result you are implicitly transposing the matrix.

2. Call the `gemvi()` function with the `cusparseOperation_t` parameter set to `CUSPARSE_OPERATION_NON_TRANSPOSE` and with the interchanged rows and columns of the matrix stored in CSC format. This (implicitly) multiplies the vector by the transpose of the matrix in the original CSR format.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

The function `cusparse<t>gemvi_bufferSize()` returns size of buffer used in `cusparse<t>gemvi()`

See `cusparseStatus_t` for the description of the return status
Chapter 9. cuSPARSE Level 3 Function Reference

This chapter describes sparse linear algebra functions that perform operations between sparse and (usually tall) dense matrices.

In particular, the solution of sparse triangular linear systems with multiple right-hand sides is implemented in two phases. First, during the analysis phase, the sparse triangular matrix is analyzed to determine the dependencies between its elements by calling the appropriate `csrsm2_analysis()` function. The analysis is specific to the sparsity pattern of the given matrix and to the selected `cusparseOperation_t` type. The information from the analysis phase is stored in the parameter of type `csrsm2Info_t` that has been initialized previously with a call to `cusparseCreateCsrsm2Info()`.

Second, during the solve phase, the given sparse triangular linear system is solved using the information stored in the `csrsm2Info_t` parameter by calling the appropriate `csrsm2_solve()` function. The solve phase may be performed multiple times with different multiple right-hand sides, while the analysis phase needs to be performed only once. This is especially useful when a sparse triangular linear system must be solved for different sets of multiple right-hand sides one at a time, while its coefficient matrix remains the same.

Finally, once all the solves have completed, the opaque data structure pointed to by the `csrsm2Info_t` parameter can be released by calling `cusparseDestroyCsrsm2Info()`.

9.1. `cusparse<t>bsrmm()`

```c
cusparseStatus_t
cusparseSbsrmm(cusparseHandle_t handle,
               cusparseDirection_t dirA,
               cusparseOperation_t transA,
               cusparseOperation_t transB,
               int mb,
               int n,
               int kb,
               int nnzb,
               const float* alpha,
               const cusparseMatDescr_t descrA,
               const float* bsrValA,
               const int* bsrRowPtrA,
               const int* bsrColIndA,
               int blockDim,
```

const float* B, int ldb, const float* beta, float* C, int ldc)

cusparseStatus_t

{cusparseDbsrmm(cusparseHandle_t handle,
cusparseDirection_t dirA,
cusparseOperation_t transA,
cusparseOperation_t transB,
int n, int kb, int nnzb,
const double* alpha,
const cusparseMatDescr_t descrA,
const double* bsrValA,
const int* bsrRowPtrA,

const double* B, int ldb,
const double* beta,
double* C, int ldc)

cusparseStatus_t

cusparseCbsrmm(cusparseHandle_t handle,
cusparseDirection_t dirA,
cusparseOperation_t transA,
cusparseOperation_t transB,
int n, int kb, int nnzb,
const cuComplex* alpha,
const cusparseMatDescr_t descrA,
const cuComplex* bsrValA,
const int* bsrRowPtrA,
int blockDim,
const cuComplex* B, int ldb,
const cuComplex* beta,
cuComplex* C, int ldc)

cusparseStatus_t

{cusparseZbsrmm(cusparseHandle_t handle,
cusparseDirection_t dirA,
cusparseOperation_t transA,
cusparseOperation_t transB,
int n, int kb, int nnzb,
const cuDoubleComplex* alpha,
const cusparseMatDescr_t descrA,
const cuDoubleComplex* bsrValA,
const int* bsrRowPtrA,
const int* bsrColIndA,
int blockDim,
const cuDoubleComplex* B,
int ldb,
const cuDoubleComplex* beta,
cuDoubleComplex* C,
int ldc)

This function performs one of the following matrix-matrix operations:

\[ C = \alpha \ast \text{op}(A) \ast \text{op}(B) + \beta \ast C \]

\( A \) is an \( mb \times kb \) sparse matrix that is defined in BSR storage format by the three arrays \( \text{bsrValA}, \text{bsrRowPtrA}, \) and \( \text{bsrColIndA} \); \( B \) and \( C \) are dense matrices; \( \alpha \) and \( \beta \) are scalars; and

\[
\text{op}(A) = \begin{cases}
A & \text{if transA == CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if transA == CUSPARSE_OPERATION_TRANSPOSE (not supported)} \\
A^H & \text{if transA == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE (not supported)}
\end{cases}
\]

and

\[
\text{op}(B) = \begin{cases}
B & \text{if transB == CUSPARSE_OPERATION_NON_TRANSPOSE} \\
B^T & \text{if transB == CUSPARSE_OPERATION_TRANSPOSE} \\
B^H & \text{if transB == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE (not supported)}
\end{cases}
\]

The function has the following limitations:

- Only CUSPARSE_MATRIX_TYPE_GENERAL matrix type is supported
- Only blockDim > 1 is supported

The motivation of \( \text{transpose}(B) \) is to improve memory access of matrix \( B \). The computational pattern of \( A \ast \text{transpose}(B) \) with matrix \( B \) in column-major order is equivalent to \( A \ast B \) with matrix \( B \) in row-major order.

In practice, no operation in an iterative solver or eigenvalue solver uses \( A \ast \text{transpose}(B) \). However, we can perform \( A \ast \text{transpose}(\text{transpose}(B)) \) which is the same as \( A \ast B \). For example, suppose \( A \) is \( mb \times kb \), \( B \) is \( k \times n \) and \( C \) is \( m \times n \), the following code shows usage of cusparseDbsrmm().

```c
// A is mb*kb, B is k*n and C is m*n
const int m = mb*blockSize;
const int k = kb*blockSize;
const int ldb_B = k; // leading dimension of B
const int ldc = m; // leading dimension of C
// perform C:=alpha*A*B + beta*C
cusparseSetMatType(descrA, CUSPARSE_MATRIX_TYPE_GENERAL);
cusparseDbsrmm(cusparse_handle, 
CUSPARSE_DIRECTION_COLUMN, 
CUSPARSE_OPERATION_NON_TRANSPOSE, 
CUSPARSE_OPERATION_NON_TRANSPOSE, 
mb, n, kb, nnzb, alpha,
descrA, bsrValA, bsrRowPtrA, bsrColIndA, blockSize, 
B, ldb_B, 
beta, C, ldc);
```

Instead of using \( A \ast B \), our proposal is to transpose \( B \) to \( B^t \) by first calling \( \text{cublas<t>geam()} \), and then to perform \( A \ast \text{transpose}(B^t) \).
// step 1: Bt := transpose(B)
const int m = mb*blockSize;
const int k = kb*blockSize;
double *Bt;
const int ldb_Bt = n; // leading dimension of Bt
cudaMalloc((void**)&Bt, sizeof(double)*ldb_Bt*k);
double one  = 1.0;
double zero = 0.0;
cublasSetPointerMode(cublas_handle, CUBLAS_POINTER_MODE_HOST);
cublasDgemm(cublas_handle, CUBLAS_OP_T, CUBLAS_OP_T,
n, k, &one, B, int ldb_B, &zero, B, int ldb_B, Bt, ldb_Bt);

// step 2: perform C:=alpha*A^T*transpose(Bt) + beta*C
 cusparseDbsrmm(cusparse_handle,
 CUSPARSE_DIRECTION_COLUMN,
 CUSPARSE_OPERATION_NON_TRANSPOSE,
 CUSPARSE_OPERATION_TRANSPOSE,
 mb, n, kb, nnzb, alpha,
 descrA, bsrValA, bsrRowPtrA, bsrColIndA, blockSize,
 Bt, ldb_Bt,
 beta, C, ldc);

bsrmm() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
</tbody>
</table>
| dir         | storage format of blocks, either CUSPARSE_DIRECTION_ROW or
               CUSPARSE_DIRECTION_COLUMN.                                |
| transA      | the operation \( \text{op}(A) \).                                           |
| transB      | the operation \( \text{op}(B) \).                                           |
| mb          | number of block rows of sparse matrix \( A \).                              |
| n           | number of columns of dense matrix \( \text{op}(B) \) and \( A \).           |
| kb          | number of block columns of sparse matrix \( A \).                           |
| nnzb        | number of non-zero blocks of sparse matrix \( A \).                        |
| alpha       | \(<\text{type}>\) scalar used for multiplication.                        |
| descrA      | the descriptor of matrix \( A \). The supported matrix type is
               CUSPARSE_MATRIX_TYPE_GENERAL. Also, the supported index bases are
               CUSPARSE_INDEX_BASE_ZERO and CUSPARSE_INDEX_BASE_ONE. |
| bsrValA     | \(<\text{type}>\) array of \( \text{nnzb} = \text{bsrRowPtrA}(mb) -
               \text{bsrRowPtrA}(0) \) nonzero blocks of matrix \( A \). |
| bsrRowPtrA  | integer array of \( mb + 1 \) elements that contains the start of every
               block row and the end of the last block row plus one. |
bsrColIndA  
integer array of \( \text{nnzb} = \text{bsrRowPtrA}(mb) - \text{bsrRowPtrA}(0) \) column indices of the nonzero blocks of matrix \( A \).

blockDim  
block dimension of sparse matrix \( A \), larger than zero.

B  
array of dimensions \((\text{ldb}, n)\) if \( \text{op}(B) = B \) and \((\text{ldb}, k)\) otherwise.

ldb  
leading dimension of \( B \). If \( \text{op}(B) = B \), it must be at least \( \text{max}(1, k) \). If \( \text{op}(B) \neq B \), it must be at least \( \text{max}(1, n) \).

beta  
\(<\text{type}>\) scalar used for multiplication. If \( \text{beta} \) is zero, \( C \) does not have to be a valid input.

C  
array of dimensions \((\text{ldc}, n)\).

ldc  
leading dimension of \( C \). It must be at least \( \text{max}(1, m) \) if \( \text{op}(A) = A \) and at least \( \text{max}(1, k) \) otherwise.

Output

\( C \)  
\(<\text{type}>\) updated array of dimensions \((\text{ldc}, n)\).

See \texttt{cusparseStatus_t} for the description of the return status

9.2. \texttt{cusparse\langle t\ranglebsrsm2_bufferSize()}

cusparseStatus_t  
cusparseSbsrsm2_bufferSize(cusparseHandle_t handle,  
cusparseDirection_t dirA,  
cusparseOperation_t transA,  
cusparseOperation_t transX,  
int mb,  
int n,  
int nnzb,  
const cusparseMatDescr_t descrA,  
const float* bsrSortedValA,  
const int* bsrSortedRowPtrA,  
const int* bsrSortedColIndA,  
int blockDim,  
csrsm2Info_t info,  
int* pBufferSizeInBytes)

cusparseStatus_t  
cusparseDbsrsm2_bufferSize(cusparseHandle_t handle,  
cusparseDirection_t dirA,  
cusparseOperation_t transA,  
cusparseOperation_t transX,  
int mb,  
int n,  
int nnzb,  
const cusparseMatDescr_t descrA,  
double* bsrSortedValA,  
const int* bsrSortedRowPtrA,  
const int* bsrSortedColIndA,  
int blockDim,  
csrsm2Info_t info,  
int* pBufferSizeInBytes)
This function returns size of buffer used in `bsrsm2()`, a new sparse triangular linear system $\text{op}(A) \times \text{op}(X) = \text{op}(B)$. $A$ is an $(mb \times blockDim) \times (mb \times blockDim)$ sparse matrix that is defined in BSR storage format by the three arrays `bsrValA`, `bsrRowPtrA`, and `bsrColIndA`; $B$ and $X$ are the right-hand-side and the solution matrices; $\alpha$ is a scalar; and

$$\text{op}(A) = \begin{cases} A & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\ A^T & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\ A^H & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE} \end{cases}$$

Although there are six combinations in terms of parameter `trans` and the upper [and lower] triangular part of $A$, `bsrsm2_bufferSize()` returns the maximum size of the buffer among these combinations. The buffer size depends on dimension `mb`, `blockDim` and the number of nonzeros of the matrix, `nnzb`. If the user changes the matrix, it is necessary to call `bsrsm2_bufferSize()` again to get the correct buffer size, otherwise a segmentation fault may occur.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

### 9.3. cusparse<t>bsrsm2_analysis()

```c

cusparseStatus_t
cusparseSbsrsm2_analysis(cusparseHandle_t handle,
cusparseDirection_t dirA,
cusparseOperation_t transA,
cusparseOperation_t transX,
int mb,
int n,
int nnzb,
const cusparseMatDescr_t descrA,
const float* bsrSortedVal,
```
This function performs the analysis phase of `bsrsm2()`, a new sparse triangular linear system \( \text{op}(A) \cdot \text{op}(X) = \alpha \cdot \text{op}(B) \).
A is an \((mb*\text{blockDim}) \times (mb*\text{blockDim})\) sparse matrix that is defined in BSR storage format by the three arrays \(\text{bsrValA}, \text{bsrRowPtrA}, \) and \(\text{bsrColIndA}\); \(B\) and \(X\) are the right-hand-side and the solution matrices; \(\alpha\) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if } \text{trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases}
\]

and

\[
\text{op}(X) = \begin{cases} 
X & \text{if } \text{transX} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
X^T & \text{if } \text{transX} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
X^H & \text{if } \text{transX} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE} \text{ (not supported)}
\end{cases}
\]

and \(\text{op}(B)\) and \(\text{op}(X)\) are equal.

The block of BSR format is of size \(\text{blockDim} \times \text{blockDim}\), stored in column-major or row-major as determined by parameter \(\text{dirA}\), which is either \text{CUSPARSE\_DIRECTION\_ROW} or \text{CUSPARSE\_DIRECTION\_COLUMN}. The matrix type must be \text{CUSPARSE\_MATRIX\_TYPE\_GENERAL}, and the fill mode and diagonal type are ignored.

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires the buffer size returned by \(\text{bsrsm2\_bufferSize()}\). The address of \(pBuffer\) must be multiple of 128 bytes. If not, \text{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Function \(\text{bsrsm2\_analysis()}\) reports a structural zero and computes the level information stored in opaque structure \(\text{info}\). The level information can extract more parallelism during a triangular solver. However \(\text{bsrsm2\_solve()}\) can be done without level information. To disable level information, the user needs to specify the policy of the triangular solver as \text{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}.

Function \(\text{bsrsm2\_analysis()}\) always reports the first structural zero, even if the parameter \(\text{policy}\) is \text{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}. Besides, no structural zero is reported if \text{CUSPARSE\_DIAG\_TYPE\_UNIT} is specified, even if block \(A(j, j)\) is missing for some \(j\). The user must call \(\text{cusparseXbsrsm2\_query\_zero\_pivot()}\) to know where the structural zero is.

If \(\text{bsrsm2\_analysis()}\) reports a structural zero, the solve will return a numerical zero in the same position as the structural zero but this result \(X\) is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

### n
number of columns of matrix \( \text{op}(B) \) and \( \text{op}(X) \).

### nnzb
number of non-zero blocks of matrix \( A \).

### descrA
the descriptor of matrix \( A \). The supported matrix type is CUSPARSE_MATRIX_TYPE_GENERAL, while the supported diagonal types are CUSPARSE_DIAG_TYPE_UNIT and CUSPARSE_DIAG_TYPE_NON_UNIT.

### bsrValA
\(<\text{type}>\) array of \( \text{nnzb} = \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0) \) nonzero blocks of matrix \( A \).

### bsrRowPtrA
integer array of \( \text{mb} + 1 \) elements that contains the start of every block row and the end of the last block row plus one.

### bsrColIndA
integer array of \( \text{nnzb} = \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0) \) column indices of the nonzero blocks of matrix \( A \).

### blockDim
block dimension of sparse matrix \( A \); larger than zero.

### info
structure initialized using cusparseCreateBsrsm2Info.

### policy
The supported policies are CUSPARSE_SOLVE_POLICY_NO_LEVEL and CUSPARSE_SOLVE_POLICY_USE_LEVEL.

### pBuffer
buffer allocated by the user; the size is return by bsrsm2_bufferSize().

### Output

| info | structure filled with information collected during the analysis phase [that should be passed to the solve phase unchanged]. |

See cusparseStatus_t for the description of the return status

cusparseDirection_t dirA,
cusparseOperation_t transA,
cusparseOperation_t transX,
int mb,
int n,
int nnzb,
const cuDoubleComplex* alpha,
```
This function performs the solve phase of the solution of a sparse triangular linear system:

\[ \text{op}(A) \times \text{op}(X) = \alpha \times \text{op}(B) \]

\( A \) is an \((mb \times \text{blockDim}) \times (mb \times \text{blockDim})\) sparse matrix that is defined in BSR storage format by the three arrays \( \text{bsrValA} \), \( \text{bsrRowPtrA} \), and \( \text{bsrColIndA} \); \( B \) and \( X \) are the right-hand-side and the solution matrices; \( \alpha \) is a scalar, and

\[
\begin{align*}
\text{op}(A) &= \begin{cases} 
A & \text{if } \text{transA} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if } \text{transA} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if } \text{transA} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases} \\
\text{op}(X) &= \begin{cases} 
X & \text{if } \text{transX} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
X^T & \text{if } \text{transX} == \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
X^H & \text{not supported}
\end{cases}
\end{align*}
\]

Only \( \text{op}(A) = A \) is supported.

\( \text{op}(B) \) and \( \text{op}(X) \) must be performed in the same way. In other words, if \( \text{op}(B) = B \), \( \text{op}(X) = X \).

The block of BSR format is of size \( \text{blockDim} \times \text{blockDim} \), stored as column-major or row-major as determined by parameter \( \text{dirA} \), which is either \text{CUSPARSE\_DIRECTION\_ROW} or \text{CUSPARSE\_DIRECTION\_COLUMN}. The matrix type must be \text{CUSPARSE\_MATRIX\_TYPE\_GENERAL}, and the fill mode and diagonal type are ignored. Function \text{bsrsm2\_solve()} can support an arbitrary \( \text{blockDim} \).

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires the buffer size returned by \text{bsrsm2\_bufferSize()}. The address of \( \text{pBuffer} \) must be multiple of 128 bytes. If it is not, \text{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Although \text{bsrsm2\_solve()} can be done without level information, the user still needs to be aware of consistency. If \text{bsrsm2\_analysis()} is called with policy \text{CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL}, \text{bsrsm2\_solve()} can be run with or without levels. On the other hand, if \text{bsrsm2\_analysis()} is called with \text{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}, \text{bsrsm2\_solve()} can only accept \text{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}; otherwise, \text{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Function \text{bsrsm02\_solve()} has the same behavior as \text{bsrsv02\_solve()}, reporting the first numerical zero, including a structural zero. The user must call \text{cusparseXbsrsm2\_query\_zero\_pivot()} to know where the numerical zero is.
The motivation of \texttt{transpose(X)} is to improve the memory access of matrix \( X \). The computational pattern of \texttt{transpose(X)} with matrix \( X \) in column-major order is equivalent to \( X \) with matrix \( X \) in row-major order.

In-place is supported and requires that \( B \) and \( X \) point to the same memory block, and \( ldb=ldx \).

The function supports the following properties if \( pBuffer \neq \text{NULL} \):

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

### 9.5. cusparseXbsrsm2_zeroPivot()

```c
cusparseStatus_t cusparseXbsrsm2_zeroPivot(cusparseHandle_t handle, 
                                       bsrsm2Info_t info, 
                                       int* position)
```

If the returned error code is CUSPARSE_STATUS_ZERO_PIVOT, position=j means A(j,j) is either a structural zero or a numerical zero (singular block). Otherwise position=-1.

The position can be 0-base or 1-base, the same as the matrix.

Function cusparseXbsrsm2_zeroPivot() is a blocking call. It calls cudaDeviceSynchronize() to make sure all previous kernels are done.

The position can be in the host memory or device memory. The user can set the proper mode with cusparseSetPointerMode().

- The routine requires no extra storage
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th></th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th></th>
<th>info contains a structural zero or a numerical zero if the user already called bsrsm2_analysis() or bsrsm2_solve().</th>
</tr>
</thead>
</table>

**Output**

<table>
<thead>
<tr>
<th></th>
<th>if no structural or numerical zero, position is -1; otherwise, if A(j,j) is missing or U(j,j) is zero, position=j.</th>
</tr>
</thead>
</table>

See **cusparseStatus_t** for the description of the return status
9.6. cu Sparse<T> csrsm2_bufferSizeExt()

[DEPRECATED] use cu SparseSpSM() instead. The routine will be removed in the next major release.

```c
cusparseStatus_t
cusparseTcsrsm2_bufferSizeExt(cusparseHandle_t handle,
int algo,
cusparseOperation_t transA,
cusparseOperation_t transB,
int m,
int nrhs,
int nnz,
const float* alpha,
const cusparseMatDescr_t descrA,
const float* csrSortedValA,
csrSortedRowPtrA,
csrSortedColIndA,
int ldb,
info,
policy,
pBufferSize)
```

```c
cusparseStatus_t
cusparseDcsrsm2_bufferSizeExt(cusparseHandle_t handle,
int algo,
cusparseOperation_t transA,
cusparseOperation_t transB,
int m,
int nrhs,
int nnz,
const double* alpha,
const cusparseMatDescr_t descrA,
const double* csrSortedValA,
csrSortedRowPtrA,
csrSortedColIndA,
int ldb,
info,
policy,
pBufferSize)
```

```c
cusparseStatus_t
cusparseCcsrsm2_bufferSizeExt(cusparseHandle_t handle,
int algo,
cusparseOperation_t transA,
cusparseOperation_t transB,
int m,
int nrhs,
int nnz,
const cuComplex* alpha,
const cusparseMatDescr_t descrA,
const cuComplex* csrSortedValA,
const cuComplex* csrSortedRowPtrA,
```

This function returns the size of the buffer used in \texttt{csrsm2}, a sparse triangular linear system \( \text{op}(A) \ast \text{op}(X) = \text{op}(B) \).

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \texttt{csrValA}, \texttt{csrRowPtrA}, and \texttt{csrColIndA}; \( B \) and \( X \) are the right-hand-side matrix and the solution matrix; \( \alpha \) is a scalar; and

\[
\text{op}(A) = \begin{cases} 
    A & \text{if trans == CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
    A^T & \text{if trans == CUSPARSE\_OPERATION\_TRANSPOSE} \\
    A^H & \text{if trans == CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases}
\]

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>

</tr>
<tr>
<td>alpha</td>
<td>(&lt;\text{type}&gt;) scalar used for multiplication.</td>
</tr>
</tbody>
</table>

\( \text{op}(A) \)
### descrA
The descriptor of matrix A. The supported matrix type is `CUSPARSE_MATRIX_TYPE_GENERAL`, while the supported diagonal types are `CUSPARSE_DIAG_TYPE_UNIT` and `CUSPARSE_DIAG_TYPE_NON_UNIT`.

### csrValA
A `<type>` array of `nnz` nonzero elements of matrix A.

### csrRowPtrA
An integer array of `m + 1` elements that contains the start of every row and the end of the last row plus one.

### csrColIndA
An integer array of `nnz` column indices of the nonzero elements of matrix A.

### B
A `<type>` right-hand-side matrix. `op(B)` is of size `m-by-nrhs`.

### ldb
Leading dimension of B and X.

### info
A structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).

### policy
The supported policies are `CUSPARSE_SOLVE_POLICY_NO_LEVEL` and `CUSPARSE_SOLVE_POLICY_USE_LEVEL`.

### Output
- `info`: record of internal states based on different algorithms.
- `pBufferSize`: number of bytes of the buffer used in the `csrsm2_analysis` and `csrsm2_solve`.

See `cusparseStatus_t` for the description of the return status.

### 9.7. `cusparse<t>csrsm2_analysis()` [DEPRECATED]

**[[DEPRECATED]]** Use `cusparseSpSM()` instead. *The routine will be removed in the next major release.*

```c
#define cusparseStatus_t

cusparseStatus_t cusparseTcsrsm2_analysis(cusparseHandle_t handle,

    const cuDoubleComplex* B,
    int ldb,
This function performs the analysis phase of `csrsm2`, a sparse triangular linear system $\text{op}(A) \times \text{op}(X) = \text{op}(B)$. 

$A$ is an $m \times m$ sparse matrix that is defined in CSR storage format by the three arrays `csrValA`, `csrRowPtrA`, and `csrColIndA`; $B$ and $X$ are the right-hand-side matrix and the solution matrix; $\alpha$ is a scalar; and

\[
\text{op}(A) = \begin{cases} 
  A & \text{if } \text{trans} \equiv \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
  A^T & \text{if } \text{trans} \equiv \text{CUSPARSE_OPERATION_TRANSPOSE} \\
  A^H & \text{if } \text{trans} \equiv \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE}
\end{cases}
\]

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a buffer size returned by `csrsm2_bufferSize()`. The address of `pBuffer` must be multiple of 128 bytes. If it is not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Function `csrsm2_analysis()` reports a structural zero and computes level information that is stored in opaque structure `info`. The level information can extract more parallelism for a triangular solver. However `csrsm2_solve()` can be done without level information. To disable level information, the user needs to specify the policy of the triangular solver as `CUSPARSE_SOLVE_POLICY_NO_LEVEL`.

Function `csrsm2_analysis()` always reports the first structural zero, even if the policy is `CUSPARSE_SOLVE_POLICY_NO_LEVEL`. No structural zero is reported if `CUSPARSE_DIAG_TYPE_UNIT` is specified, even if $A(j,j)$ is missing for some $j$. The user needs to call `cusparseXcsrsm2_zeroPivot()` to know where the structural zero is.

It is the user’s choice whether to call `csrsm2_solve()` if `csrsm2_analysis()` reports a structural zero. In this case, the user can still call `csrsm2_solve()` which will return a numerical zero in the same position as the structural zero. However the result $X$ is meaningless.

#### 9.8. **cusparse<t>csrsm2_solve()**

[[DEPRECATED]] use **cusparseSpSM()** instead. *The routine will be removed in the next major release*

```c
 cusparseStatus_t cusparseScsrsm2_solve(cusparseHandle_t handle, 
                                cusparseOperation_t algo, 
                                cusparseOperation_t transA, 
                                cusparseOperation_t transB, 
                                int m, 
                                int nrhs, 
                                int nnz, 
                                const float* alpha, 
                                const cusparseMatDescr_t descrA, 
                                const float* csrSortedValA, 
                                const int* csrSortedRowPtrA, 
                                const int* csrSortedColIndA, 
                                float* B, 
                                int ldb, 
                                csrsm2Info_t info, 
                                cusparseSolvePolicy_t policy, 
                                ...);
```
This function performs the solve phase of \( \text{csrsm2} \), a sparse triangular linear system \( \text{op}(A) \cdot \text{op}(X) = \text{op}(B) \).
A is an m×m sparse matrix that is defined in CSR storage format by the three arrays csrValA, csrRowPtrA, and csrColIndA; B and X are the right-hand-side matrix and the solution matrix; α is a scalar; and

\[ \text{op}(A) = \begin{cases} 
A & \text{if } \text{transA} == \text{CUSPARSE_OPERATION_NON_TRANSPOSE} \\
A^T & \text{if } \text{transA} == \text{CUSPARSE_OPERATION_TRANSPOSE} \\
A^H & \text{if } \text{transA} == \text{CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} 
\end{cases} \]

\[ \text{transB} \] acts on both matrix B and matrix X, only CUSPARSE_OPERATION_NON_TRANSPOSE and CUSPARSE_OPERATION_TRANSPOSE. The operation is in-place, matrix B is overwritten by matrix X.

\[ \text{ldb} \] must be not less than m if transB = CUSPARSE_OPERATION_NON_TRANSPOSE. Otherwise, \[ \text{ldb} \] must be not less than nrhs.

This function requires the buffer size returned by csrsm2_bufferSize(). The address of pBuffer must be multiple of 128 bytes. If it is not, CUSPARSE_STATUS_INVALID_VALUE is returned.

Although csrsm2_solve() can be done without level information, the user still needs to be aware of consistency. If csrsm2_analysis() is called with policy CUSPARSE_SOLVE_POLICY_USE_LEVEL, csrsm2_solve() can be run with or without levels. On the contrary, if csrsm2_analysis() is called with CUSPARSE_SOLVE_POLICY_NO_LEVEL, csrsm2_solve() can only accept CUSPARSE_SOLVE_POLICY_NO_LEVEL; otherwise, CUSPARSE_STATUS_INVALID_VALUE is returned.

The level information may not improve the performance but spend extra time doing analysis. For example, a tridiagonal matrix has no parallelism. In this case, CUSPARSE_SOLVE_POLICY_NO_LEVEL performs better than CUSPARSE_SOLVE_POLICY_USE_LEVEL. If the user has an iterative solver, the best approach is to do csrsm2_analysis() with CUSPARSE_SOLVE_POLICY_USE_LEVEL once. Then do csrsm2_solve() with CUSPARSE_SOLVE_POLICY_NO_LEVEL in the first run and with CUSPARSE_SOLVE_POLICY_USE_LEVEL in the second run, picking faster one to perform the remaining iterations.

Function csrsm2_solve() reports the first numerical zero, including a structural zero. If status is 0, no numerical zero was found. Furthermore, no numerical zero is reported if CUSPARSE_DIAG_TYPE_UNIT is specified, even if \( A(j, j) \) is zero for some \( j \). The user needs to call cusparseXcsrsm2_zeroPivot() to know where the numerical zero is.

csrsm2 provides two algorithms specified by the parameter algo. algo=0 is non-block version and algo=1 is block version. non-block version is memory-bound, limited by bandwidth. block version partitions the matrix into small tiles and applies desne operations. Although it has more flops than non-block version, it may be faster if non-block version already reaches maximum bandwidth..

Appendix section shows an example of csrsm2.

The function supports the following properties if pBuffer != NULL

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

const int* cscColPtrB,
const int* cscRowIndB,
const cuDoubleComplex* beta,
cuDoubleComplex* C,
int ldc)
This function performs the following matrix–matrix operations:

\[
C = \alpha \mathbf{A} \mathbf{B} + \beta \mathbf{C}
\]

\(A\) and \(C\) are dense matrices; \(B\) is a \(k \times n\) sparse matrix that is defined in CSC storage format by the three arrays \(\text{cscValB}, \text{cscColPtrB},\) and \(\text{cscRowIndB}\); \(\alpha\) and \(\beta\) are scalars; and

Remark: \(B\) is base-0.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

int* csrSortedColIndC,
void* pBuffer)

This function performs following matrix-matrix operation

\[ C = \alpha \cdot A + \beta \cdot B \]

where A, B, and C are \(m \times n\) sparse matrices (defined in CSR storage format by the three arrays csrValA|csrValB|csrValC, csrRowPtrA|csrRowPtrB|csrRowPtrC, and csrColIndA|csrColIndB|csrColIndC respectively), and \(\alpha\) and \(\beta\) are scalars. Since A and B have different sparsity patterns, cuSPARSE adopts a two-step approach to complete sparse matrix C. In the first step, the user allocates csrRowPtrC of \(m+1\) elements and uses function cusparseXcsrgeam2Nnz() to determine csrRowPtrC and the total number of nonzero elements. In the second step, the user gathers \(\text{nnzC}\) (number of nonzero elements of matrix C) from either \(\text{nnzC}=\text{nnzTotalDevHostPtr}\) or \(\text{nnzC}=(\text{csrRowPtrC}(m)-\text{csrRowPtrC}(0))\) and allocates csrValC, csrColIndC of \(\text{nnzC}\) elements respectively, then finally calls function cusparse[S|D|C|Z]csrgeam2() to complete matrix C.

The general procedure is as follows:

```c
int baseC, nnzC;
/* alpha, nnzTotalDevHostPtr points to host memory */
size_t BufferSizeInBytes;
char *buffer = NULL;
int *nnzTotalDevHostPtr = &nnzC;
cusparseSetPointerMode(handle, CUSPARSE_POINTER_MODE_HOST);
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
/* prepare buffer */
cusparseScsrgeam2_bufferSizeExt(handle, m, n,
    alpha,
```
Several comments on \texttt{csrgeam2()}:

- The other three combinations, \texttt{NT}, \texttt{TN}, and \texttt{TT}, are not supported by \texttt{cuSPARSE}. In order to do any one of the three, the user should use the routine \texttt{csr2csc()} to convert $A|B$ to $A^T|B^T$.

- Only \texttt{CUSPARSE\_MATRIX\_TYPE\_GENERAL} is supported. If either $A$ or $B$ is symmetric or Hermitian, then the user must extend the matrix to a full one and reconfigure the \texttt{MatrixType} field of the descriptor to \texttt{CUSPARSE\_MATRIX\_TYPE\_GENERAL}.

- If the sparsity pattern of matrix $C$ is known, the user can skip the call to function \texttt{cusparseXcsrgeam2Nnz()}. For example, suppose that the user has an iterative algorithm which would update $A$ and $B$ iteratively but keep the sparsity patterns. The user can call function \texttt{cusparseXcsrgeam2Nnz()} once to set up the sparsity pattern of $C$, then call function \texttt{cusparse[S|D|C|Z]geam()} only for each iteration.

- The pointers \texttt{alpha} and \texttt{beta} must be valid.

- When \texttt{alpha} or \texttt{beta} is zero, it is not considered a special case by \texttt{cuSPARSE}. The sparsity pattern of $C$ is independent of the value of \texttt{alpha} and \texttt{beta}. If the user wants $C = 0 \times A + 1 \times B^T$, then \texttt{csr2csc()} is better than \texttt{csrgeam2()}.

- \texttt{csrgeam2()} is the same as \texttt{csrgeam()} except \texttt{csrgeam2()} needs explicit buffer where \texttt{csrgeam()} allocates the buffer internally.

- This function requires temporary extra storage that is allocated internally.

- The routine does not support asynchronous execution.
The routine does not support CUDA graph capture

nnzTotalDevHostPtr

Total number of nonzero elements in device or host memory. It is equal to \((\text{csrRowPtrC}(m) - \text{csrRowPtrC}(0))\).

See \texttt{cusparseStatus_t} for the description of the return status.

### 10.2. \texttt{cusparse<t>csrgemm2()} [DEPRECATED]

[[DEPRECATED]] use \texttt{cusparseSpGEMM()} instead. The routine will be removed in the next major release.

```c
#include <cusparse.h>

// Computes \(C = \alpha \cdot A \cdot B + \beta \cdot C\) in \(\text{csrRowPtrC}(m)\), \(\text{csrColIndC}(k)\) format.

// CUSPARSE_STATUS_SUCCESS if successful, otherwise
int cusparseScsrgemm2_bufferSizeExt(cusparseHandle_t handle,
                                      int m,
                                      int n,
                                      int k,
                                      const float* alpha,

```

---

`cusparseCcsrgemm2()` and `cusparseZcsrgemm2()` are functions in the cuSPARSE library that perform matrix multiplication for sparse matrices in the cuSparse format. The functions take the following arguments:

- `handle`: A handle to the cuSPARSE library context.
- `m`, `n`, `k`: The dimensions of the matrices.
- `alpha`: A scalar multiplier for the multiplication.
- `descrA`, `csrValA`, `csrRowPtrA`, `csrColIndA`: Descriptors and arrays for the first sparse matrix.
- `descrB`, `csrValB`, `csrRowPtrB`, `csrColIndB`: Descriptors and arrays for the second sparse matrix.
- `beta`: An optional scalar multiplier for the result.
- `descrC`, `csrValC`, `csrRowPtrC`, `csrColIndC`: Descriptors and arrays for the result matrix.
- `info`, `pBuffer`: Optional arguments for error checking and buffer allocation.
This function performs following matrix-matrix operation:

\[ C = \alpha \times A \times B + \beta \times D \]

where \( A, B, D \) and \( C \) are \( m \times k, k \times n, m \times n \) and \( m \times n \) sparse matrices (defined in CSR storage format by the three arrays \( \text{csrValA}, \text{csrValB}, \text{csrValD}, \text{csrValC}, \text{csrRowPtrA}, \text{csrRowPtrB}, \text{csrRowPtrD}, \text{csrRowPtrC}, \) and \( \text{csrColIndA}, \text{csrColIndB}, \text{csrColIndD}, \text{csrColIndC} \) respectively.

Note that the new API \( \text{cusparseSpGEMM} \) requires that \( D \) must have the same sparsity pattern of \( C \).

The \( \text{csrgemm2} \) uses \( \alpha \) and \( \beta \) to support the following operations:

<table>
<thead>
<tr>
<th>( \alpha )</th>
<th>( \beta )</th>
<th>operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>invalid</td>
</tr>
<tr>
<td>NULL</td>
<td>!NULL</td>
<td>( C = \beta \times D, A ) and ( B ) are not used</td>
</tr>
<tr>
<td>!NULL</td>
<td>NULL</td>
<td>( C = \alpha \times A \times B, D ) is not used</td>
</tr>
<tr>
<td>!NULL</td>
<td>!NULL</td>
<td>( C = \alpha \times A \times B + \beta \times D )</td>
</tr>
</tbody>
</table>

The numerical value of \( \alpha \) and \( \beta \) only affects the numerical values of \( C \), not its sparsity pattern. For example, if \( \alpha \) and \( \beta \) are not zero, the sparsity pattern of \( C \) is union of \( A \times B \) and \( D \), independent of numerical value of \( \alpha \) and \( \beta \).

The following table shows different operations according to the value of \( m, n \) and \( k \)

<table>
<thead>
<tr>
<th>( m, n, k )</th>
<th>operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>( m &lt; 0 ) or ( n &lt; 0 ) or ( k &lt; 0 )</td>
<td>invalid</td>
</tr>
<tr>
<td>( m ) is 0 or ( n ) is 0</td>
<td>do nothing</td>
</tr>
<tr>
<td>( m &gt; 0 ) and ( n &gt; 0 ) and ( k = 0 )</td>
<td>invalid if ( \beta ) is zero; ( C = \beta \times D ) if ( \beta ) is not zero.</td>
</tr>
<tr>
<td>( m &gt; 0 ) and ( n &gt; 0 ) and ( k &gt; 0 )</td>
<td>( C = \beta \times D ) if ( \alpha ) is zero. ( C = \alpha \times A \times B ) if ( \alpha ) is zero. ( C = \alpha \times A \times B + \beta \times D ) if ( \alpha ) and ( \beta ) are not zero.</td>
</tr>
</tbody>
</table>

This function requires the buffer size returned by \( \text{csrgemm2_bufferSizeExt()} \). The address of \( \text{pBuffer} \) must be multiple of 128 bytes. If it is not, \( \text{CUSPARSE_STATUS_INVALID_VALUE} \) is returned.

The cuSPARSE library adopts a two-step approach to complete sparse matrix. In the first step, the user allocates \( \text{csrRowPtrC} \) of \( m+1 \) elements and uses the function \( \text{cusparseXcsrgemm2Nnz()} \) to determine \( \text{csrRowPtrC} \) and the total number of nonzero elements. In the second step, the user gathers \( \text{nnzC} \) (the number of nonzero elements of matrix \( C \)) from either \( \text{nnzC} = \* \text{nnzTotalDevHostPtr} \) or \( \text{nnzC} = \text{csrRowPtrC}(m) - \text{csrRowPtrC}(0) \) and allocates \( \text{csrValC} \) and \( \text{csrColIndC} \) of \( \text{nnzC} \) elements respectively, then finally calls function \( \text{cusparse}[S|D|C|Z] \text{csrgemm2()} \) to evaluate matrix \( C \).

The general procedure of \( C = -A \times B + D \) is as follows:

```c
// assume matrices A, B and D are ready.
```
```c
int baseC, nnzC;
csr2info_t info = NULL;
size_t bufferSize;
void *buffer = NULL;

// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzC;
double alpha = -1.0;
double beta  = 1.0;
cusparseSetPointerMode(handle, CUSPARSE_POINTER_MODE_HOST);

// step 1: create an opaque structure
cusparseCreateCsr2Info(&info);

// step 2: allocate buffer for csr2nnz and csr2

cusparseDcsr2_bufferSizeExt(handle, m, n, k, &alpha,
descrA, nnzA, csrRowPtrA, csrColIndA,
descrB, nnzB, csrRowPtrB, csrColIndB,
&beta,
descrD, nnzD, csrRowPtrD, csrColIndD,
info, &bufferSize);
cudaMalloc(&buffer, bufferSize);

// step 3: compute csrRowPtrC
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
cusparseXcsr2nnz(handle, m, n, k,
descrA, nnzA, csrRowPtrA, csrColIndA,
descrB, nnzB, csrRowPtrB, csrColIndB,
descrD, nnzD, csrRowPtrD, csrColIndD,
descrC, csrRowPtrC, nnzTotalDevHostPtr,
info, buffer);
if (NULL != nnzTotalDevHostPtr){
  nnzC = *nnzTotalDevHostPtr;
}else{
  cudaMemcpy(&nnzC, csrRowPtrC+m, sizeof(int), cudaMemcpyDeviceToHost);
  cudaMemcpy(&baseC, csrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
  nnzC -= baseC;
}

// step 4: finish sparsity pattern and value of C

cudaMalloc((void**)&csrColIndC, sizeof(int)*nnzC);
cudaMalloc((void**)&csrValC, sizeof(double)*nnzC);

// Remark: set csrValC to null if only sparsity pattern is required.
cusparseDcsr2(handle, m, n, k, &alpha,
descrA, nnzA, csrValA, csrRowPtrA, csrColIndA,
descrB, nnzB, csrValB, csrRowPtrB, csrColIndB,
&beta,
descrD, nnzD, csrValD, csrRowPtrD, csrColIndD,
descrC, csrRowPtrC, csrColIndC, csrValC, csrColIndC,
info, buffer);

// step 5: destroy the opaque structure

cusparseDestroyCsr2Info(info);
```

Several comments on `csrgemm2()`:

- Only the NN version is supported. For other modes, the user has to transpose A or B explicitly.
- Only `CUSPARSE_MATRIX_TYPE_GENERAL` is supported. If either A or B is symmetric or Hermitian, the user must extend the matrix to a full one and reconfigure the `MatrixType` field descriptor to `CUSPARSE_MATRIX_TYPE_GENERAL`.
- If `csrValC` is zero, only sparsity pattern of C is calculated.
The functions `cusparseXcsrgeam2Nnz()` and `cusparse<t>csrgeam2()` supports the following properties if `pBuffer != NULL`:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine does **not** support CUDA graph capture

See [cusparseStatus_t](#) for the description of the return status
This chapter describes the routines that implement different preconditioners.

11.1. Incomplete Cholesky Factorization: level 0

Different algorithms for ic0 are discussed in this section.

11.1.1. cusparse<t>csric02_bufferSize()

cusparseStatus_t cusparseScsric02_bufferSize(cusparseHandle_t handle, int m, int nnz, const cusparseMatDescr_t descrA, float* csrValA, const int* csrRowPtrA, const int* csrColIndA, csric02Info_t info, int* pBufferSizeInBytes)

cusparseStatus_t cusparseDcsric02_bufferSize(cusparseHandle_t handle, int m, int nnz, const cusparseMatDescr_t descrA, double* csrValA, const int* csrRowPtrA, const int* csrColIndA, csric02Info_t info, int* pBufferSizeInBytes)

cusparseStatus_t cusparseCcsric02_bufferSize(cusparseHandle_t handle, int m, int nnz, const cusparseMatDescr_t descrA, cuComplex* csrValA, const int* csrRowPtrA, const int* csrColIndA, csric02Info_t info, int* pBufferSizeInBytes)
This function returns size of buffer used in computing the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

\[ A \approx LL^H \]

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \).

The buffer size depends on dimension \( m \) and \( \text{nnz} \), the number of nonzeros of the matrix. If the user changes the matrix, it is necessary to call \( \text{csric02_bufferSize() \ } \) again to have the correct buffer size; otherwise, a segmentation fault may occur.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

**Output**
### 11.1.2. `cusparse<t>csric02_analysis()`

The `cusparse<t>csric02_analysis()` function is used to record internal states based on different algorithms. The number of bytes of the buffer used in `csric02_analysis()` and `csric02()` is determined by the `pBufferSizeInBytes` parameter.

#### C Declaration

```c
cusparseStatus_tcusparseScsric02_analysis(cusparseHandle_t handle,
                                      int m,
                                      int nnz,
                                      const cusparseMatDescr_t descrA,
                                      const float* csrValA,
                                      const int* csrRowPtrA,
                                      const int* csrColIndA,
                                      csric02Info_t info,
                                      cusparseSolvePolicy_t policy,
                                      void* pBuffer)

cusparseStatus_tcusparseDcsric02_analysis(cusparseHandle_t handle,
                                      int m,
                                      int nnz,
                                      const cusparseMatDescr_t descrA,
                                      const double* csrValA,
                                      const int* csrRowPtrA,
                                      const int* csrColIndA,
                                      csric02Info_t info,
                                      cusparseSolvePolicy_t policy,
                                      void* pBuffer)

cusparseStatus_tcusparseCcsric02_analysis(cusparseHandle_t handle,
                                      int m,
                                      int nnz,
                                      const cusparseMatDescr_t descrA,
                                      const cuComplex* csrValA,
                                      const int* csrRowPtrA,
                                      const int* csrColIndA,
                                      csric02Info_t info,
                                      cusparseSolvePolicy_t policy,
                                      void* pBuffer)

cusparseStatus_tcusparseZcsric02_analysis(cusparseHandle_t handle,
                                      int m,
                                      int nnz,
                                      const cusparseMatDescr_t descrA,
                                      const cuDoubleComplex* csrValA,
                                      const int* csrRowPtrA,
                                      const int* csrColIndA,
                                      csric02Info_t info,
                                      cusparseSolvePolicy_t policy,
                                      void* pBuffer)
```

See [cusparseStatus_t](#) for the description of the return status.
This function performs the analysis phase of the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

\[ A = LL^H \]

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \).

This function requires a buffer size returned by \( \text{csric02_bufferSize()} \). The address of \( \text{pBuffer} \) must be multiple of 128 bytes. If not, \( \text{CUSPARSE_STATUS_INVALID_VALUE} \) is returned.

Function \( \text{csric02_analysis()} \) reports a structural zero and computes level information stored in the opaque structure \( \text{info} \). The level information can extract more parallelism during incomplete Cholesky factorization. However \( \text{csric02()} \) can be done without level information. To disable level information, the user must specify the policy of \( \text{csric02_analysis()} \) and \( \text{csric02()} \) as \( \text{CUSPARSE_SOLVE_POLICY_NO_LEVEL} \).

Function \( \text{csric02_analysis()} \) always reports the first structural zero, even if the policy is \( \text{CUSPARSE_SOLVE_POLICY_NO_LEVEL} \). The user needs to call \( \text{cusparseXcsric02_zeroPivot()} \) to know where the structural zero is.

It is the user’s choice whether to call \( \text{csric02()} \) if \( \text{csric02_analysis()} \) reports a structural zero. In this case, the user can still call \( \text{csric02()} \), which will return a numerical zero at the same position as the structural zero. However the result is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

### cusparse<t>csric02()

The supported policies are:
- `CUSPARSE_SOLVE_POLICY_NO_LEVEL`
- `CUSPARSE_SOLVE_POLICY_USE_LEVEL`

The buffer allocated by the user; the size is returned by `csric02_bufferSize()`.

Output:

- **info**: number of bytes of the buffer used in `csric02_analysis()` and `csric02()`.

See `cusparseStatus_t` for the description of the return status.
This function performs the solve phase of the computing the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

\[ A \approx LL^H \]

This function requires a buffer size returned by `csric02_bufferSize()`. The address of `pBuffer` must be a multiple of 128 bytes. If not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Although `csric02()` can be done without level information, the user still needs to be aware of consistency. If `csric02_analysis()` is called with policy `CUSPARSE_SOLVE_POLICY_USE_LEVEL`, `csric02()` can be run with or without levels. On the other hand, if `csric02_analysis()` is called with `CUSPARSE_SOLVE_POLICY_NO_LEVEL`, `csric02()` can only accept `CUSPARSE_SOLVE_POLICY_NO_LEVEL`; otherwise, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Function `csric02()` reports the first numerical zero, including a structural zero. The user must call `cusparseXcsric02_zeroPivot()` to know where the numerical zero is.

Function `csric02()` only takes the lower triangular part of matrix A to perform factorization. The matrix type must be `CUSPARSE_MATRIX_TYPE_GENERAL`, the fill mode and diagonal type are ignored, and the strictly upper triangular part is ignored and never touched. It does not matter if A is Hermitian or not. In other words, from the point of view of `csric02()` A is Hermitian and only the lower triangular part is provided.

Note: In practice, a positive definite matrix may not have incomplete cholesky factorization. To the best of our knowledge, only matrix M can guarantee the existence of incomplete cholesky factorization. If `csric02()` failed cholesky factorization and reported a numerical zero, it is possible that incomplete cholesky factorization does not exist.

For example, suppose A is a real \( m \times m \) matrix, the following code solves the precondition system \( M*y = x \) where M is the product of Cholesky factorization L and its transpose.

\[ M = LL^H \]

```c
// Suppose that A is m x m sparse matrix represented by CSR format,
// Assumption:
// - handle is already created by cusparseCreate(),
// - (d_csrRowPtr, d_csrColInd, d_csrVal) is CSR of A on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory,
// - d_z is intermediate result on device memory.

cusparseMatDescr_t descr_M = 0;
cusparseMatDescr_t descr_L = 0;
csrco2Info_t info_M  = 0;
csrsv2Info_t  info_L  = 0;
csrsv2Info_t  info_Lt = 0;
int pBufferSize_M;
int pBufferSize_L;
int pBufferSize_Lt;
int pBufferSize;
void *pBuffer = 0;
```
int structural_zero;
int numerical_zero;
const double alpha = 1.;
const cusparseSolvePolicy_t policy_M  = CUSPARSE_SOLVE_POLICY_NO_LEVEL;
const cusparseSolvePolicy_t policy_L  = CUSPARSE_SOLVE_POLICY_NO_LEVEL;
const cusparseSolvePolicy_t policy_Lt = CUSPARSE_SOLVE_POLICY_USE_LEVEL;
const cusparseOperation_t trans_L  = CUSPARSE_OPERATION_NON_TRANSPOSE;
const cusparseOperation_t trans_Lt = CUSPARSE_OPERATION_TRANSPOSE;

// step 1: create a descriptor which contains
// - matrix M is base-1
// - matrix L is base-1
// - matrix L is lower triangular
// - matrix L has non-unit diagonal

</tr>
</tbody>
</table>
pBuffer | buffer allocated by the user; the size is returned by `csric02_bufferSize()`.

Output

| csrValA_valM | <type> matrix containing the incomplete-Cholesky lower triangular factor. |

See `cusparseStatus_t` for the description of the return status

### 11.1.4. `cusparseXcsric02_zeroPivot()`

```c
cusparseStatus_t
cusparseXcsric02_zeroPivot(cusparseHandle_t handle,
                          csric02Info_t info,
                          int* position)
```

If the returned error code is `CUSPARSE_STATUS_ZERO_PIVOT`, `position=j` means \( A(j,j) \) has either a structural zero or a numerical zero; otherwise, `position=-1`.

The position can be 0-based or 1-based, the same as the matrix.

Function `cusparseXcsric02_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.

The position can be in the host memory or device memory. The user can set proper mode with `cusparseSetPointerMode()`.

- The routine requires no extra storage
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>handle</th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>info</td>
<td>info contains structural zero or numerical zero if the user already called <code>csric02_analysis()</code> or <code>csric02()</code>.</td>
</tr>
</tbody>
</table>

**Output**

| position | if no structural or numerical zero, position is -1; otherwise, if \( A(j,j) \) is missing or \( L(j,j) \) is zero, position=j. |

See `cusparseStatus_t` for the description of the return status

### 11.1.5. `cusparse<t>bsric02_bufferSize()`

```c
cusparseStatus_t
cusparseSbsric02_bufferSize(cusparseHandle_t handle,
                            cusparseDirection_t dirA,
                            int mb,
                            int* pBuffer)
```

See `cusparseStatus_t` for the description of the return status
This function returns the size of a buffer used in computing the incomplete-Cholesky factorization with 0 fill-in and no pivoting

\[ A \approx LL^T \]

\( A \) is an \((\text{mb} \times \text{blockDim}) \times (\text{mb} \times \text{blockDim})\) sparse matrix that is defined in BSR storage format by the three arrays \( \text{bsrValA}, \text{bsrRowPtrA}, \text{bsrColIndA} \).

The buffer size depends on the dimensions of \( \text{mb}, \text{blockDim}, \) and the number of nonzero blocks of the matrix \( \text{nnzb} \). If the user changes the matrix, it is necessary to call \( \text{bsric02_bufferSize()} \) again to have the correct buffer size; otherwise, a segmentation fault may occur.
The routine requires no extra storage
The routine supports asynchronous execution
The routine supports CUDA graph capture

### 11.1.6. `cusparse<t>bsric02_analysis()`

```c
cusparseStatus_t
cusparseSbsric02_analysis(cusparseHandle_t handle,
                         cusparseDirection_t dirA,
                         int mb,
                         int nnzb,
                         const cusparseMatDescr_t descrA,
                         const float* bsrValA,
                         const int* bsrRowPtrA,
                         const int* bsrColIndA,
                         int blockDim,
                         int* pBufferSizeInBytes)
```
This function performs the analysis phase of the incomplete-Cholesky factorization with 0 fill-in and no pivoting

\[ A \approx LL^H \]

\( A \) is an \((mb*blockDim)x(mb*blockDim)\) sparse matrix that is defined in BSR storage format by the three arrays `bsrValA`, `bsrRowPtrA`, and `bsrColIndA`. The block in BSR format is of size `blockDim*blockDim`, stored as column-major or row-major as determined by parameter `dirA`, which is either `CUSPARSE_DIRECTION_COLUMN` or `CUSPARSE_DIRECTION_ROW`. The matrix type must be `CUSPARSE_MATRIX_TYPE_GENERAL`, and the fill mode and diagonal type are ignored.
This function requires a buffer size returned by \texttt{bsric02\_bufferSize90}. The address of \texttt{pBuffer} must be a multiple of 128 bytes. If it is not, \texttt{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Function \texttt{bsric02\_analysis()} reports structural zero and computes level information stored in the opaque structure \texttt{info}. The level information can extract more parallelism during incomplete Cholesky factorization. However \texttt{bsric02()} can be done without level information. To disable level information, the user needs to specify the parameter \texttt{policy} of \texttt{bsric02[\_analysis]} as \texttt{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}.

Function \texttt{bsric02\_analysis} always reports the first structural zero, even when parameter \texttt{policy} is \texttt{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}. The user must call \texttt{cusparseXbsric02\_zeroPivot()} to know where the structural zero is.

It is the user’s choice whether to call \texttt{bsric02()} if \texttt{bsric02\_analysis()} reports a structural zero. In this case, the user can still call \texttt{bsric02()}, which returns a numerical zero in the same position as the structural zero. However the result is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

</tbody>
</table>
pBuffer | buffer allocated by the user; the size is returned by `bsric02_bufferSize()`.

Output

info | structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).

See `cusparseStatus_t` for the description of the return status

11.1.7. `cusparse<t>bsric02()`

cusparseStatus_t cusparseSbsric02(cusparseHandle_t handle, cusparseDirection_t dirA, int mb, int nnzb, const cusparseMatDescr_t descrA, float* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, bsric02Info_t info, cusparseSolvePolicy_t policy, void* pBuffer)

cusparseStatus_t cusparseDbsric02(cusparseHandle_t handle, cusparseDirection_t dirA, int mb, int nnzb, const cusparseMatDescr_t descrA, double* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, bsric02Info_t info, cusparseSolvePolicy_t policy, void* pBuffer)

cusparseStatus_t cusparseCbsric02(cusparseHandle_t handle, cusparseDirection_t dirA, int mb, int nnzb, const cusparseMatDescr_t descrA, cuComplex* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, bsric02Info_t info, cusparseSolvePolicy_t policy, void* pBuffer)
This function performs the solve phase of the incomplete-Cholesky factorization with 0 fill-in and no pivoting

\[ A = LL^H \]

\( A \) is an \((mb\times blockDim) \times (mb\times blockDim)\) sparse matrix that is defined in BSR storage format by the three arrays \( bsrValA, bsrRowPtrA, \) and \( bsrColIndA \). The block in BSR format is of size \( blockDim^2 \), stored as column-major or row-major as determined by parameter \( dirA \), which is either \text{CUSPARSE\_DIRECTION\_COLUMN} or \text{CUSPARSE\_DIRECTION\_ROW}. The matrix type must be \text{CUSPARSE\_MATRIX\_TYPE\_GENERAL}, and the fill mode and diagonal type are ignored.

This function requires a buffer size returned by \text{bsric02\_bufferSize()}. The address of \( pBuffer \) must be a multiple of 128 bytes. If it is not, \text{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Although \text{bsric02()} can be done without level information, the user must be aware of consistency. If \text{bsric02\_analysis()} is called with policy \text{CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL}, \text{bsric02()} can be run with or without levels. On the other hand, if \text{bsric02\_analysis()} is called with \text{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}, \text{bsric02()} can only accept \text{CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL}; otherwise, \text{CUSPARSE\_STATUS\_INVALID\_VALUE} is returned.

Function \text{bsric02()} has the same behavior as \text{csric02 ()}. That is, \text{bsr2csr(bsric02(A))} = \text{csric02(bsr2csr(A))}. The numerical zero of \text{csric02()} means there exists some zero \( L(j,j) \). The numerical zero of \text{bsric02()} means there exists some block \( L_j,j \) that is not invertible.

Function \text{bsric02()} reports the first numerical zero, including a structural zero. The user must call \text{cusparseXbsric02\_zeroPivot()} to know where the numerical zero is.

The \text{bsric02()} function only takes the lower triangular part of matrix \( A \) to perform factorization. The strictly upper triangular part is ignored and never touched. It does not matter if \( A \) is Hermitian or not. In other words, from the point of view of \text{bsric02()}, \( A \) is Hermitian and only the lower triangular part is provided. Moreover, the imaginary part of diagonal elements of diagonal blocks is ignored.

For example, suppose \( A \) is a real \( m \)-by-\( m \) matrix, where \( m=mb\times blockDim \). The following code solves precondition system \( M^*y = x \), where \( M \) is the product of Cholesky factorization \( L \) and its transpose.
\[ M = LL^H \]

Suppose that \( A \) is \( m \times m \) sparse matrix represented by BSR format,

The number of block rows/columns is \( mb \), and

the number of nonzero blocks is \( nnzb \).

Assumption:
- handle is already created by \( \text{cusparseCreate}() \),
- \((d\_bsrRowPtr, d\_bsrColInd, d\_bsrVal)\) is BSR of \( A \) on device memory,
- \( d\_x \) is right hand side vector on device memory,
- \( d\_y \) is solution vector on device memory.
- \( d\_z \) is an intermediate result on device memory.
- \( d\_x \), \( d\_y \) and \( d\_z \) are of size \( m \).

<tr>
<td>dirA</td>
<td>storage format of blocks, either CUSPARSE_DIRECTION_ROW or CUSPARSE_DIRECTION_COLUMN.</td>
</tr>
</tbody>
</table>
### mb
- number of block rows and block columns of matrix $A$.

### nnzb
- number of nonzero blocks of matrix $A$.

### descrA
- the descriptor of matrix $A$. The supported matrix type is CUSPARSE_MATRIX_TYPE_GENERAL. Also, the supported index bases are CUSPARSE_INDEX_BASE_ZERO and CUSPARSE_INDEX_BASE_ONE.

### bsrValA
- `<type>` array of `nnzb` (= `bsrRowPtrA(mb) - bsrRowPtrA(0)`) nonzero blocks of matrix $A$.

### bsrRowPtrA
- integer array of `mb` + 1 elements that contains the start of every block row and the end of the last block row plus one.

### bsrColIndA
- integer array of `nnzb` (= `bsrRowPtrA(mb) - bsrRowPtrA(0)`) column indices of the nonzero blocks of matrix $A$.

### blockDim
- block dimension of sparse matrix $A$, larger than zero.

### info
- structure with information collected during the analysis phase [that should have been passed to the solve phase unchanged].

### policy
- the supported policies are CUSPARSE_SOLVE_POLICY_NO_LEVEL and CUSPARSE_SOLVE_POLICY_USE_LEVEL.

### pBuffer
- buffer allocated by the user, the size is returned by `bsric02_bufferSize()`.

### Output

### bsrValA
- `<type>` matrix containing the incomplete-Cholesky lower triangular factor.

See [cusparseStatus_t](#) for the description of the return status

### 11.1.8. cusparseXbsric02_zeroPivot()

```c
cusparseStatus_t
cusparseXbsric02_zeroPivot(cusparseHandle_t handle,
                            bsric02Info_t info,
                            int* position)
```

If the returned error code is CUSPARSE_STATUS_ZERO_PIVOT, `position=j` means $A(j,j)$ has either a structural zero or a numerical zero (the block is not positive definite). Otherwise `position=-1`.

The `position` can be 0-based or 1-based, the same as the matrix.

Function `cusparseXbsric02_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.
The position can be in the host memory or device memory. The user can set the proper mode with `cusparseSetPointerMode()`.

- The routine requires no extra storage
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>handle</th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>info</td>
<td>info contains a structural zero or a numerical zero if the user already called <code>bsric02_analysis()</code> or <code>bsric02()</code>.</td>
</tr>
</tbody>
</table>

**Output**

| position | if no structural or numerical zero, position is -1, otherwise if $A(j,j)$ is missing or $L(j,j)$ is not positive definite, position=j |

See `cusparseStatus_t` for the description of the return status

### 11.2. Incomplete LU Factorization: level 0

Different algorithms for `ilu0` are discussed in this section.

#### 11.2.1. `cusparse<t>csrilu02_numericBoost()`

```c
cusparseStatus_t
cusparseScsrilu02_numericBoost(cusparseHandle_t handle, csrilu02Info_t info, int enable_boost, double* tol, float* boost_val)
cusparseStatus_t
cusparseDcsrilu02_numericBoost(cusparseHandle_t handle, csrilu02Info_t info, int enable_boost, double* tol, double* boost_val)
cusparseStatus_t
cusparseCcsrilu02_numericBoost(cusparseHandle_t handle, csrilu02Info_t info, int enable_boost, double* tol, cuComplex* boost_val)
cusparseStatus_t
cusparseZcsrilu02_numericBoost(cusparseHandle_t handle, csrilu02Info_t info, int enable_boost, double* tol, cuDoubleComplex* boost_val)
```
The user can use a boost value to replace a numerical value in incomplete LU factorization. The `tol` is used to determine a numerical zero, and the `boost_val` is used to replace a numerical zero. The behavior is:

\[
\text{if } \text{tol} \geq \text{fabs}(A(j,j)), \text{then } A(j,j) = \text{boost_val}.
\]

To enable a boost value, the user has to set parameter `enable_boost` to 1 before calling `csrilu02()`. To disable a boost value, the user can call `csrilu02_numericBoost()` again with parameter `enable_boost=0`.

If `enable_boost=0`, `tol` and `boost_val` are ignored.

Both `tol` and `boost_val` can be in the host memory or device memory. The user can set the proper mode with `cusparseSetPointerMode()`.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>

<td>boost value to replace a numerical zero.</td>
</tr>
</tbody>
</table>

See **cusparseStatus_t** for the description of the return status

### 11.2.2. `cusparse<t>csrilu02_bufferSize()`

```c

cusparseStatus_t
cusparseScsrilu02_bufferSize(cusparseHandle_t handle,
                              int m,
                              int nnz,
                              const cusparseMatDescr_t descrA,
                              float* csrValA,
                              const int* csrRowPtrA,
                              const int* csrColIndA,
                              csrilu02Info_t info,
                              int* pBufferSizeInBytes)

cusparseStatus_t
cusparseDcsrilu02_bufferSize(cusparseHandle_t handle,
                              int m,
                              int nnz,
                              const cusparseMatDescr_t descrA,
                              double* csrValA,
                              const int* csrRowPtrA,
                              const int* csrColIndA,
```
This function returns size of the buffer used in computing the incomplete-LU factorization with 0 fill-in and no pivoting:

$$A \approx LU$$

$A$ is an $m \times m$ sparse matrix that is defined in CSR storage format by the three arrays $csrValA$, $csrRowPtrA$, and $csrColIndA$.

The buffer size depends on the dimension $m$ and $nnz$, the number of nonzeros of the matrix. If the user changes the matrix, it is necessary to call `csrilu02_bufferSize()` again to have the correct buffer size; otherwise, a segmentation fault may occur.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

See [cusparseStatus_t](#) for the description of the return status

### 11.2.3. cusparse\(<t>\)csrilu02_analysis()

```c
 cusparseStatus_t
cusparseScsrilu02_analysis(cusparseHandle_t         handle,
 int                      m,
 int                      nnz,
 const cusparseMatDescr_t descrA,
 const float*            csrValA,
 const int*              csrRowPtrA,
 const int*              csrColIndA,
 csrilu02Info_t          info,
 cusparseSolvePolicy_t   policy,
 void*                   pBuffer)  

cusparseStatus_t
cusparseDcsrilu02_analysis(cusparseHandle_t         handle,
 int                      m,
 int                      nnz,
 const cusparseMatDescr_t descrA,
 const double*            csrValA,
 const int*              csrRowPtrA,
 const int*              csrColIndA,
 csrilu02Info_t          info,
 cusparseSolvePolicy_t   policy,
 void*                   pBuffer)  

cusparseStatus_t
cusparseCcsrilu02_analysis(cusparseHandle_t         handle,
 int                      m,
 int                      nnz,
 const cusparseMatDescr_t descrA,
 const cuComplex*         csrValA,
 const int*              csrRowPtrA,
 const int*              csrColIndA,
 csrilu02Info_t          info,
 cusparseSolvePolicy_t   policy,
 void*                   pBuffer)  

cusparseStatus_t
cusparseZcsrilu02_analysis(cusparseHandle_t         handle,
 int                      m,
 int                      nnz,
 const cusparseMatDescr_t descrA,
 const cuComplex*         csrValA,
 const int*              csrRowPtrA,
 const int*              csrColIndA,
 csrilu02Info_t          info,
 cusparseSolvePolicy_t   policy,
 void*                   pBuffer)  
```
This function performs the analysis phase of the incomplete-LU factorization with 0 fill-in and no pivoting:

\[ A \approx LU \]

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays \( \text{csrValA} \), \( \text{csrRowPtrA} \), and \( \text{csrColIndA} \).

This function requires the buffer size returned by \( \text{csrilu02_bufferSize()} \). The address of \( \text{ pBuffer} \) must be a multiple of 128 bytes. If not, \( \text{CUSPARSE_STATUS_INVALID_VALUE} \) is returned.

Function \( \text{csrilu02_analysis()} \) reports a structural zero and computes level information stored in the opaque structure \( \text{info} \). The level information can extract more parallelism during incomplete LU factorization; however \( \text{csrilu02()} \) can be done without level information. To disable level information, the user must specify the policy of \( \text{csrilu02()} \) as \( \text{CUSPARSE_SOLVE_POLICY_NO_LEVEL} \).

It is the user’s choice whether to call \( \text{csrilu02()} \) if \( \text{csrilu02_analysis()} \) reports a structural zero. In this case, the user can still call \( \text{csrilu02()} \), which will return a numerical zero at the same position as the structural zero. However the result is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

</thead>
</table>

See [cusparseStatus_t](#) for the description of the return status.

### 11.2.4. cusparse<t>csrilu02()

```c
 cusparseStatus_t cusparseScsrilu02(cusparseHandle_t handle,
 int m,
 int nnz,
 const cusparseMatDescr_t descrA,
 float* csrValA_valM,
 const int* csrRowPtrA,
 const int* csrColIndA,
 csrilu02Info_t info,
 cusparseSolvePolicy_t policy,
 void* pBuffer)
```

```c
 cusparseStatus_t cusparseDcsrilu02(cusparseHandle_t handle,
 int m,
 int nnz,
 const cusparseMatDescr_t descrA,
 double* csrValA_valM,
 const int* csrRowPtrA,
 const int* csrColIndA,
 csrilu02Info_t info,
 cusparseSolvePolicy_t policy,
 void* pBuffer)
```

```c
 cusparseStatus_t cusparseCcsrilu02(cusparseHandle_t handle,
 int m,
 int nnz,
 const cusparseMatDescr_t descrA,
 cuComplex* csrValA_valM,
 const int* csrRowPtrA,
 const int* csrColIndA,
 csrilu02Info_t info,
 cusparseSolvePolicy_t policy,
 void* pBuffer)
```

```c
 cusparseStatus_t cusparseZcsrilu02(cusparseHandle_t handle,
 int m,
```
This function performs the solve phase of the incomplete-LU factorization with 0 fill-in and no pivoting:

\[ A \approx LU \]

\( A \) is an \( m \times m \) sparse matrix that is defined in CSR storage format by the three arrays `csrValA_valM`, `csrRowPtrA`, and `csrColIndA`.

This function requires a buffer size returned by `csrilu02_bufferSize()`. The address of `pBuffer` must be a multiple of 128 bytes. If not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

The matrix type must be `CUSPARSE_MATRIX_TYPE_GENERAL`. The fill mode and diagonal type are ignored.

Although `csrilu02()` can be done without level information, the user still needs to be aware of consistency. If `csrilu02_analysis()` is called with policy `CUSPARSE_SOLVE_POLICY_USE_LEVEL`, `csrilu02()` can be run with or without levels. On the other hand, if `csrilu02_analysis()` is called with `CUSPARSE_SOLVE_POLICY_NO_LEVEL`, `csrilu02()` can only accept `CUSPARSE_SOLVE_POLICY_NO_LEVEL`; otherwise, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Function `csrilu02()` reports the first numerical zero, including a structural zero. The user must call `cusparseXcsrilu02_zeroPivot()` to know where the numerical zero is.

For example, suppose \( A \) is a real \( m \times m \) matrix, the following code solves precondition system \( M * y = x \) where \( M \) is the product of LU factors \( L \) and \( U \).

```c
// Suppose that A is m x m sparse matrix represented by CSR format,
// Assumption:
// - handle is already created by cusparseCreate(),
// - (d_csrRowPtr, d_csrColInd, d_csrVal) is CSR of A on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory.
// - d_z is intermediate result on device memory.

cusparseMatDescr_t descr_M = 0;
cusparseMatDescr_t descr_L = 0;
cusparseMatDescr_t descr_U = 0;
csrilu02Info_t info_M = 0;
csrsv2Info_t info_L = 0;
csrsv2Info_t info_U = 0;
int pBufferSize_M;
int pBufferSize_L;
int pBufferSize_U;
int pBufferSize;
void *pBuffer = 0;
int structural_zero;
int numerical_zero;
const double alpha = 1.;
const cusparseSolvePolicy_t policy_M = CUSPARSE_SOLVE_POLICY_NO_LEVEL;
const cusparseSolvePolicy_t policy_L = CUSPARSE_SOLVE_POLICY_NO_LEVEL;
const cusparseSolvePolicy_t policy_U = CUSPARSE_SOLVE_POLICY_USE_LEVEL;
```
const cusparseOperation_t trans_L  = CUSPARSE_OPERATION_NON_TRANSPOSE;
const cusparseOperation_t trans_U  = CUSPARSE_OPERATION_NON_TRANSPOSE;

// step 1: create a descriptor which contains
// - matrix M is base-1
// - matrix L is base-1
// - matrix L is lower triangular
// - matrix L has unit diagonal
// - matrix U is base-1
// - matrix U is upper triangular
// - matrix U has non-unit diagonal
cusparseCreateMatDescr(&descr_M);
cusparseSetMatIndexBase(descr_M, CUSPARSE_INDEX_BASE_ONE);
cusparseSetMatType(descr_M, CUSPARSE_MATRIX_TYPE_GENERAL);
cusparseCreateMatDescr(&descr_L);
cusparseSetMatIndexBase(descr_L, CUSPARSE_INDEX_BASE_ONE);
cusparseSetMatType(descr_L, CUSPARSE_MATRIX_TYPE_GENERAL);
cusparseSetMatFillMode(descr_L, CUSPARSE_FILL_MODE_LOWER);
cusparseSetMatDiagType(descr_L, CUSPARSE_DIAG_TYPE_UNIT);
cusparseCreateMatDescr(&descr_U);
cusparseSetMatIndexBase(descr_U, CUSPARSE_INDEX_BASE_ONE);
cusparseSetMatType(descr_U, CUSPARSE_MATRIX_TYPE_GENERAL);
cusparseSetMatFillMode(descr_U, CUSPARSE_FILL_MODE_UPPER);
cusparseSetMatDiagType(descr_U, CUSPARSE_DIAG_TYPE_NON_UNIT);

// step 2: create a empty info structure
// we need one info for csrilu02 and two info's for csrsv2
 cusparseCreateCsrilu02Info(&info_M);
cusparseCreateCsrilu02Info(&info_L);
cusparseCreateCsrilu02Info(&info_U);

// step 3: query how much memory used in csrilu02 and csrsv2, and allocate the
// buffer

 cusparseDcsrilu02_bufferSize(handle, m, nnz,
   descr_M, d_csrVal, d_csrRowPtr, d_csrColInd, info_M, &pBufferSize_M);
 cusparseDcsrilu02_bufferSize(handle, trans_L, m, nnz,
   descr_L, d_csrVal, d_csrRowPtr, d_csrColInd, info_L, &pBufferSize_L);
 cusparseDcsrilu02_bufferSize(handle, trans_U, m, nnz,
   descr_U, d_csrVal, d_csrRowPtr, d_csrColInd, info_U, &pBufferSize_U);

 pBufferSize = max(pBufferSize_M, max(pBufferSize_L, pBufferSize_U));

// pBuffer returned by cudaMalloc is automatically aligned to 128 bytes.
cudaMalloc((void**)&pBuffer, pBufferSize);

// step 4: perform analysis of incomplete Cholesky on M
//       perform analysis of triangular solve on L
//       perform analysis of triangular solve on U
// The lower(upper) triangular part of M has the same sparsity pattern as L(U),
// we can do analysis of csrilu0 and csrsv2 simultaneously.

cusparseDcsrilu02_analysis(handle, m, nnz, descr_M,
   d_csrVal, d_csrRowPtr, d_csrColInd, info_M, policy_M, pBuffer);

 status = cusparseXcsrilu02_zeroPivot(handle, info_M, &structural_zero);
 if (CUSPARSE_STATUS_ZERO_PIVOT == status){
   printf("A(%d,%d) is missing\n", structural_zero, structural_zero);
 }

cusparseDcsrsv2_analysis(handle, trans_L, m, nnz, descr_L,
   d_csrVal, d_csrRowPtr, d_csrColInd,
   info_L, policy_L, pBuffer);

cusparseDcsrsv2_analysis(handle, trans_U, m, nnz, descr_U,
   d_csrVal, d_csrRowPtr, d_csrColInd,
The function supports the following properties if pBuffer != NULL

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

### Input

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>m</td>
<td>number of rows and columns of matrix A.</td>
</tr>
<tr>
<td>nnz</td>
<td>number of nonzeros of matrix A.</td>
</tr>
<tr>
<td>descrA</td>
<td>the descriptor of matrix A. The supported matrix type is CUSPARSE_MATRIX_TYPE_GENERAL. Also, the supported index bases are CUSPARSE_INDEX_BASE_ZERO and CUSPARSE_INDEX_BASE_ONE.</td>
</tr>
<tr>
<td>csrValA_valM</td>
<td>&lt;type&gt; array of nnz( = csrRowPtrA(m) - csrRowPtrA(0) ) nonzero elements of matrix A.</td>
</tr>
<tr>
<td>csrRowPtrA</td>
<td>integer array of m + 1 elements that contains the start of every row and the end of the last row plus one.</td>

</tbody>
</table>
The supported policies are `CUSPARSE_SOLVE_POLICY_NO_LEVEL` and `CUSPARSE_SOLVE_POLICY_USE_LEVEL`.

The buffer allocated by the user; the size is returned by `csrilu02_bufferSize()`.

### Output

A matrix containing the incomplete-LU lower and upper triangular factors.

See `cusparseStatus_t` for the description of the return status.

### `cusparseXcsrilu02_zeroPivot()`

```c
cusparseStatus_t
cusparseXcsrilu02_zeroPivot(cusparseHandle_t handle, csrilu02Info_t info, int* position)
```

If the returned error code is `CUSPARSE_STATUS_ZERO_PIVOT`, `position=j` means $A(j,j)$ has either a structural zero or a numerical zero; otherwise, `position=-1`.

The position can be 0-based or 1-based, the same as the matrix.

Function `cusparseXcsrilu02_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.

The position can be in the host memory or device memory. The user can set proper mode with `cusparseSetPointerMode()`.

- The routine requires no extra storage
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

### Input

- `handle` handle to the cuSPARSE library context.
- `info` contains structural zero or numerical zero if the user already called `csrilu02_analysis()` or `csrilu02()`.

### Output

- `position` if no structural or numerical zero, position is -1; otherwise if $A(j,j)$ is missing or $U(j,j)$ is zero, position=j.

See `cusparseStatus_t` for the description of the return status.

### `cusparse<t>bsrilu02_numericBoost()`

```c
cusparseStatus_t
```

### Notes

- The routine requires no extra storage
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture
The user can use a boost value to replace a numerical value in incomplete LU factorization. Parameter `tol` is used to determine a numerical zero, and `boost_val` is used to replace a numerical zero. The behavior is as follows:

- If \( \text{tol} \geq \text{fabs}(A(j,j)) \), then reset each diagonal element of block \( A(j,j) \) by \( \text{boost_val} \).

To enable a boost value, the user sets parameter `enable_boost` to 1 before calling `bsrilu02()`. To disable the boost value, the user can call `bsrilu02_numericBoost()` with parameter `enable_boost=0`.

If `enable_boost=0`, `tol` and `boost_val` are ignored.

Both `tol` and `boost_val` can be in host memory or device memory. The user can set the proper mode with `cusparseSetPointerMode()`.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

11.2.7. cusparse<t>bsrilu02_bufferSize()

This function returns the size of the buffer used in computing the incomplete-LU factorization with 0 fill-in and no pivoting.
A is an (mb*blockDim)*(mb*blockDim) sparse matrix that is defined in BSR storage format by the three arrays bsrValA, bsrRowPtrA, and bsrColIndA. The buffer size depends on the dimensions of mb, blockDim, and the number of nonzero blocks of the matrix nnzb. If the user changes the matrix, it is necessary to call bsrilu02_bufferSize() again to have the correct buffer size; otherwise, a segmentation fault may occur.

**Input**

- **handle**: handle to the cuSPARSE library context.
- **dirA**: storage format of blocks, either CUSPARSE_DIRECTION_ROW or CUSPARSE_DIRECTION_COLUMN.
- **mb**: number of block rows and columns of matrix A.
- **nnzb**: number of nonzero blocks of matrix A.
- **descrA**: the descriptor of matrix A. The supported matrix type is CUSPARSE_MATRIX_TYPE_GENERAL. Also, the supported index bases are CUSPARSE_INDEX_BASE_ZERO and CUSPARSE_INDEX_BASE_ONE.
- **bsrValA**: <type> array of nnzb = bsrRowPtrA(mb) - bsrRowPtrA(0) nonzero blocks of matrix A.
- **bsrRowPtrA**: integer array of mb + 1 elements that contains the start of every block row and the end of the last block row plus one.
- **bsrColIndA**: integer array of nnzb = bsrRowPtrA(mb) - bsrRowPtrA(0) column indices of the nonzero blocks of matrix A.
- **blockDim**: block dimension of sparse matrix A, larger than zero.

**Output**

- **info**: record internal states based on different algorithms.
- **pBufferSizeInBytes**: number of bytes of the buffer used in bsrilu02_analysis() and bsrilu02().

**Status Returned**

- CUSPARSE_STATUS_SUCCESS: the operation completed successfully.
- CUSPARSE_STATUS_NOT_INITIALIZED: the library was not initialized.
- CUSPARSE_STATUS_ALLOC_FAILED: the resources could not be allocated.
- CUSPARSE_STATUS_INVALID_VALUE: invalid parameters were passed (mb, nnzb<=0, base index is not 0 or 1).
- CUSPARSE_STATUS_ARCH_MISMATCH: the device only supports compute capability 2.0 and above.
### 11.2.8. `cusparse<t>bsrilu02_analysis()`

<table>

const int*               bsrColIndA,
int                      blockDim,
bsrilu02Info_t           info,
cusparseSolvePolicy_t    policy,
```
void* pBuffer)

This function performs the analysis phase of the incomplete-LU factorization with 0 fill-in and no pivoting

\[ A \approx LU \]

\( A \) is an \((mb\times blockDim)\times(mb\times blockDim)\) sparse matrix that is defined in BSR storage format by the three arrays \( bsrValA, bsrRowPtrA, \) and \( bsrColIndA \). The block in BSR format is of size \( blockDim\times blockDim \), stored as column-major or row-major as determined by parameter \( \text{dirA} \), which is either CUSPARSE_DIRECTION_COLUMN or CUSPARSE_DIRECTION_ROW. The matrix type must be CUSPARSE_MATRIX_TYPE_GENERAL, and the fill mode and diagonal type are ignored.

This function requires a buffer size returned by \( \text{bsrilu02_bufferSize()} \). The address of \( pBuffer \) must be multiple of 128 bytes. If it is not, CUSPARSE_STATUS_INVALID_VALUE is returned.

Function \( \text{bsrilu02_analysis()} \) reports a structural zero and computes level information stored in the opaque structure \( \text{info} \). The level information can extract more parallelism during incomplete LU factorization. However \( \text{bsrilu02()} \) can be done without level information. To disable level information, the user needs to specify the parameter policy of \( \text{bsrilu02[ analysis| ]} \) as CUSPARSE_SOLVE_POLICY_NO_LEVEL.

Function \( \text{bsrilu02_analysis()} \) always reports the first structural zero, even with parameter policy is CUSPARSE_SOLVE_POLICY_NO_LEVEL. The user must call \( \text{cusparseXbsrilu02_zeroPivot()} \) to know where the structural zero is.

It is the user’s choice whether to call \( \text{bsrilu02()} \) if \( \text{bsrilu02_analysis()} \) reports a structural zero. In this case, the user can still call \( \text{bsrilu02()} \), which will return a numerical zero at the same position as the structural zero. However the result is meaningless.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

</tbody>
</table>

**Output**
| **info** | structure filled with information collected during the analysis phase [that should be passed to the solve phase unchanged]. |

See \[ \text{cusparseStatus\_t} \] for the description of the return status.

### 11.2.9. \text{cusparse<t>bsrilu02}()

```c
 cusparseStatus\_t cusparseSbsrilu02(cusparseHandle\_t handle, cusparseDirection\_t dirA, int mb, int nnzb, const cusparseMatDescr\_t descr, float\* bsrValA, const int\* bsrRowPtrA, const int\* bsrColIndA, int blockDim, bsrilu02Info\_t info, cusparseSolvePolicy\_t policy, void\* pBuffer)
```

```c
 cusparseStatus\_t cusparseDbsrilu02(cusparseHandle\_t handle, cusparseDirection\_t dirA, int mb, int nnzb, const cusparseMatDescr\_t descr, double\* bsrValA, const int\* bsrRowPtrA, const int\* bsrColIndA, int blockDim, bsrilu02Info\_t info, cusparseSolvePolicy\_t policy, void\* pBuffer)
```
This function performs the solve phase of the incomplete-LU factorization with 0 fill-in and no pivoting

\[ A \approx LU \]

\( A \) is an \((mb\times blockDim)\times(mb\times blockDim)\) sparse matrix that is defined in BSR storage format by the three arrays \( bsrValA, bsrRowPtrA, \) and \( bsrColIndA \). The block in BSR format is of size \( blockDim\times blockDim \), stored as column-major or row-major determined by parameter \( dirA \), which is either \( \text{CUSPARSE_DIRECTION_COLUMN} \) or \( \text{CUSPARSE_DIRECTION_ROW} \). The matrix type must be \( \text{CUSPARSE_MATRIX_TYPE_GENERAL} \), and the fill mode and diagonal type are ignored.

Function \( \text{bsrilu02}() \) supports an arbitrary \( blockDim \).

This function requires a buffer size returned by \( \text{bsrilu02_bufferSize()} \). The address of \( pBuffer \) must be a multiple of 128 bytes. If it is not, \( \text{CUSPARSE_STATUS_INVALID_VALUE} \) is returned.

Although \( \text{bsrilu02}() \) can be used without level information, the user must be aware of consistency. If \( \text{bsrilu02_analysis()} \) is called with policy \( \text{CUSPARSE_SOLVE_POLICY_USE_LEVEL} \), \( \text{bsrilu02}() \) can be run with or without levels. On the other hand, if \( \text{bsrilu02_analysis()} \) is called with \( \text{CUSPARSE_SOLVE_POLICY_NO_LEVEL} \), \( \text{bsrilu02}() \) can only accept \( \text{CUSPARSE_SOLVE_POLICY_NO_LEVEL} \); otherwise, \( \text{CUSPARSE_STATUS_INVALID_VALUE} \) is returned.

Function \( \text{bsrilu02}() \) has the same behavior as \( \text{csrilu02}() \). That is, \( \text{bsr2csr(bsrilu02(A))} = \text{csrilu02(bsr2csr(A))} \). The numerical zero of \( \text{csrilu02}() \) means there exists some zero \( U(j,j) \). The numerical zero of \( \text{bsrilu02}() \) means there exists some block \( U(j,j) \) that is not invertible.

Function \( \text{bsrilu02}() \) reports the first numerical zero, including a structural zero. The user must call \( \text{cusparseXbsrilu02_zeroPivot()} \) to know where the numerical zero is.
For example, suppose $A$ is a real $m$-by-$m$ matrix where $m = mb \times \text{blockDim}$. The following code solves precondition system $M \mathbf{y} = \mathbf{x}$, where $M$ is the product of LU factors $L$ and $U$.

```c
// Suppose that $A$ is $m \times m$ sparse matrix represented by BSR format,
// The number of block rows/columns is $mb$, and
// the number of nonzero blocks is $nnzb$.
// Assumption:
// - handle is already created by cusparseCreate(),
// - $(d_{\text{bsrRowPtr}}, d_{\text{bscColInd}}, d_{\text{bsrVal})}$ is BSR of $A$ on device memory,
// - $d_{\mathbf{x}}$ is right hand side vector on device memory.
// - $d_{\mathbf{y}}$ is solution vector on device memory.
// - $d_{\mathbf{z}}$ is intermediate result on device memory.
// - $d_{\mathbf{x}}, d_{\mathbf{y}}$ and $d_{\mathbf{z}}$ are of size $m$.

### 11.2.10. `cusparseXbsrilu02_zeroPivot()`

```c
 cusparseStatus_t cusparseXbsrilu02_zeroPivot(cusparseHandle_t handle,  
                                           bsrilu02Info_t info,  
                                           int* position)
```
If the returned error code is CUSPARSE_STATUS_ZERO_PIVOT, position=j means A(j,j) has either a structural zero or a numerical zero (the block is not invertible). Otherwise position=-1.

The position can be 0-based or 1-based, the same as the matrix.

Function cusparseXbsrilu02_zeroPivot() is a blocking call. It calls cudaDeviceSynchronize() to make sure all previous kernels are done.

The position can be in the host memory or device memory. The user can set proper the mode with cusparseSetPointerMode().

- The routine requires no extra storage
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

### Input

| handle | handle to the cuSPARSE library context. |
| info   | info contains structural zero or numerical zero if the user already called bsrilu02_analysis() or bsrilu02(). |

### Output

| position | if no structural or numerical zero, position is -1; otherwise if A(j,j) is missing or U(j,j) is not invertible, position=j. |

See [cusparseStatus_t](#) for the description of the return status

## 11.3. Tridiagonal Solve

Different algorithms for tridiagonal solve are discussed in this section.

### 11.3.1. cusparse<t>gtsv2_buffSizeExt()
This function returns the size of the buffer used in \texttt{gtsv2} which computes the solution of a tridiagonal linear system with multiple right-hand sides.

\[ A \times X = B \]

The coefficient matrix \( A \) of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower \( \{dl\} \), main \( \{d\} \), and upper \( \{du\} \) matrix diagonals; the right-hand sides are stored in the dense matrix \( B \). Notice that solution \( X \) overwrites right-hand-side matrix \( B \) on exit.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>m</td>
<td>the size of the linear system [must be ( \geq 3 )].</td>
</tr>
<tr>
<td>n</td>
<td>number of right-hand sides, columns of matrix ( B ).</td>
</tr>
<tr>
<td>dl</td>
<td>(&lt;\text{type}&gt;) dense array containing the lower diagonal of the tri-diagonal linear system. The first element of each lower diagonal must be zero.</td>
</tr>
<tr>
<td>d</td>
<td>(&lt;\text{type}&gt;) dense array containing the main diagonal of the tri-diagonal linear system.</td>
</tr>
<tr>
<td>du</td>
<td>(&lt;\text{type}&gt;) dense array containing the upper diagonal of the tri-diagonal linear system. The last element of each upper diagonal must be zero.</td>
</tr>
</tbody>
</table>
<type> dense right-hand-side array of dimensions (ldb, n).

Output

| pBufferSizeInBytes | number of bytes of the buffer used in the gtsv2. |

See cusparseStatus_t for the description of the return status

### 11.3.2. cusparse<t>gtsv2()

This function computes the solution of a tridiagonal linear system with multiple right-hand sides:
\[ A \times X = B \]

The coefficient matrix \( A \) of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower \( [d_l] \), main \( [d] \), and upper \( [d_u] \) matrix diagonals; the right-hand sides are stored in the dense matrix \( B \). Notice that solution \( X \) overwrites right-hand-side matrix \( B \) on exit.

Assuming \( A \) is of size \( m \) and base-1, \( [d_l] \), \( d \) and \( [d_u] \) are defined by the following formula:

\[
d_l(i) := A(i, i-1) \quad \text{for } i=1,2,\ldots,m
\]

The first element of \( d_l \) is out-of-bound \( (d_l(1) := A(1,0)) \), so \( d_l(1) = 0 \).

\[
d(i) = A(i,i) \quad \text{for } i=1,2,\ldots,m
\]

\[
d_u(i) = A(i,i+1) \quad \text{for } i=1,2,\ldots,m
\]

The last element of \( d_u \) is out-of-bound \( (d_u(m) := A(m,m+1)) \), so \( d_u(m) = 0 \).

The routine does perform pivoting, which usually results in more accurate and more stable results than \texttt{cusparse<t>gtsv_nopivot()} or \texttt{cusparse<t>gtsv2_nopivot()} at the expense of some execution time.

This function requires a buffer size returned by \texttt{gtsv2_bufferSizeExt()}. The address of \( pBuffer \) must be multiple of 128 bytes. If it is not, \texttt{CUSPARSE_STATUS_INVALID_VALUE} is returned.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

B
<type> dense solution array of dimensions (ldb,
n).

See `cusparseStatus_t` for the description of the return status

### 11.3.3. `cusparse<t>gtsv2_nopivot_bufferSizeExt()`

```c
 cusparseStatus_t
cusparseSgtsv2_nopivot_bufferSizeExt(cusparseHandle_t handle,
          int m,
          int n,
          const float* dl,
          const float* d,
          const float* du,
          const float* B,
          int ldb,
          size_t* bufferSizeInBytes)
```

```c
 cusparseStatus_t
cusparseDgtsv2_nopivot_bufferSizeExt(cusparseHandle_t handle,
          int m,
          int n,
          const double* dl,
          const double* d,
          const double* du,
          const double* B,
          int ldb,
          size_t* bufferSizeInBytes)
```

```c
 cusparseStatus_t
cusparseCgtsv2_nopivot_bufferSizeExt(cusparseHandle_t handle,
          int m,
          int n,
          const cuComplex* dl,
          const cuComplex* d,
          const cuComplex* du,
          const cuComplex* B,
          int ldb,
          size_t* bufferSizeInBytes)
```

```c
 cusparseStatus_t
cusparseZgtsv2_nopivot_bufferSizeExt(cusparseHandle_t handle,
          int m,
          int n,
          const cuDoubleComplex* dl,
          const cuDoubleComplex* d,
          const cuDoubleComplex* du,
          const cuDoubleComplex* B,
          int ldb,
          size_t* bufferSizeInBytes)
```

This function returns the size of the buffer used in `gtsv2_nopivot` which computes the solution of a tridiagonal linear system with multiple right-hand sides.

\[ A \times X = B \]
The coefficient matrix $A$ of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower ($d_l$), main ($d$), and upper ($d_u$) matrix diagonals; the right-hand sides are stored in the dense matrix $B$. Notice that solution $X$ overwrites right-hand-side matrix $B$ on exit.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

### 11.3.4. cusparse<t>gtsv2_nopivot()

```c
    cusparseStatus_t
    cusparseSgtsv2_nopivot(cusparseHandle_t handle,
                            int m,
                            int n,
                            const float* dl,
                            const float* d,
                            const float* du,
                            float* B,
                            int ldb,
                            void* pBuffer)
```

```c
    cusparseStatus_t
    cusparseDgtsv2_nopivot(cusparseHandle_t handle,
                            int m,
                            int n,
                            const double* dl,
```

---

---
This function computes the solution of a tridiagonal linear system with multiple right-hand sides:

\[ A \times X = B \]

The coefficient matrix \( A \) of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower (\( d_l \)), main (\( d \)), and upper (\( d_u \)) matrix diagonals; the right-hand sides are stored in the dense matrix \( B \). Notice that solution \( X \) overwrites right-hand-side matrix \( B \) on exit.

The routine does not perform any pivoting and uses a combination of the Cyclic Reduction (CR) and the Parallel Cyclic Reduction (PCR) algorithms to find the solution. It achieves better performance when \( m \) is a power of 2.

This function requires a buffer size returned by \gtsv2\_nopivot\_bufferSizeExt(). The address of \( p\text{Buffer} \) must be multiple of 128 bytes. If it is not, \( \text{CUSPARSE\_STATUS\_INVALID\_VALUE} \) is returned.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

**Input**

<table>
<thead>

### Batched Tridiagonal Solve

Different algorithms for batched tridiagonal solve are discussed in this section.

#### 11.4.1. `cusparse<t>gtsv2StridedBatch_bufferSizeExt()`

```c
 cusparse<t>gtsv2StridedBatch_bufferSizeExt(cusparseHandle_t handle, 
 int m, 
 const float* dl, 
 const float* d, 
 const float* du, 
 const float* x, 
 int batchCount, 
 int batchStride, 
 size_t* bufferSizeInBytes)
```

```c
 cusparse<t>gtsv2StridedBatch_bufferSizeExt(cusparseHandle_t handle, 
 int m, 
 const double* dl, 
 const double* d, 
 const double* du, 
 const double* x, 
 int batchCount, 
 int batchStride, 
 size_t* bufferSizeInBytes)
```

```c
 cusparse<t>gtsv2StridedBatch_bufferSizeExt(cusparseHandle_t handle, 
 int m, 
 const float* dl, 
 const float* d, 
 const float* du, 
 const float* x, 
 int batchCount, 
 int batchStride, 
 size_t* bufferSizeInBytes)
```
const cuComplex* dl,
const cuComplex* d,
const cuComplex* du,
const cuComplex* x,
int    batchCount,
int    batchStride,
size_t* bufferSizeInBytes)

cusparseStatus_t
cusparseZgtsv2StridedBatch_bufferSizeExt(cusparseHandle_t       handle,
int                    m,
const cuDoubleComplex* dl,
const cuDoubleComplex* d,
const cuDoubleComplex* du,
const cuDoubleComplex* x,
int                    batchCount,
int                    batchStride,
size_t*               bufferSizeInBytes)

This function returns the size of the buffer used in gtsv2StridedBatch which computes the solution of multiple tridiagonal linear systems for $i=0,...,\text{batchCount}$:

$$A^{(i)}x^{(i)} = y^{(i)}$$

The coefficient matrix $A$ of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower $\{dl\}$, main $\{d\}$, and upper $\{du\}$ matrix diagonals; the right-hand sides are stored in the dense matrix $X$. Notice that solution $Y$ overwrites right-hand-side matrix $X$ on exit. The different matrices are assumed to be of the same size and are stored with a fixed batchStride in memory.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

Input

<table>
<thead>
<tr>
<th>handle</th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>the size of the linear system (must be $\geq 3$).</td>
</tr>
<tr>
<td>dl</td>
<td>&lt;type&gt; dense array containing the lower diagonal of the tri-diagonal linear system. The lower diagonal $d_{l_{(i)}}$ that corresponds to the $i^{th}$ linear system starts at location $dl+batch_\text{Stride}\times i$ in memory. Also, the first element of each lower diagonal must be zero.</td>
</tr>
<tr>
<td>d</td>
<td>&lt;type&gt; dense array containing the main diagonal of the tri-diagonal linear system. The main diagonal $d_{d_{(i)}}$ that corresponds to the $i^{th}$ linear system starts at location $d+batch_\text{Stride}\times i$ in memory.</td>
</tr>
<tr>
<td>du</td>
<td>&lt;type&gt; dense array containing the upper diagonal of the tri-diagonal linear system. The upper diagonal $d_{u_{(i)}}$ that corresponds to the $i^{th}$ linear linear system starts at location $du+batch_\text{Stride}\times i$ in memory.</td>
</tr>
</tbody>
</table>
system starts at location $du+batch\text{Stride}\times i$ in memory. Also, the last element of each upper diagonal must be zero.

$x$<type> dense array that contains the right-hand-side of the tri-diagonal linear system. The right-hand-side $x^i$ that corresponds to the $i^{th}$ linear system starts at location $x+batch\text{Stride}\times i$ in memory.

$batchCount$ number of systems to solve.

$batch\text{Stride}$ stride [number of elements] that separates the vectors of every system [must be at least $m$].

### Output

$pBuffer\text{SizeInBytes}$ number of bytes of the buffer used in the $gtsv2\text{StridedBatch}$.

See $cusparse\text{Status}_t$ for the description of the return status

#### 11.4.2. cusparse$\langle t\rangle gtsv2\text{StridedBatch}$

```c
cusparseStatus_t
cusparseSgtsv2StridedBatch(cusparseHandle_t handle,
int m,
const float* dl,
const float* d,
const float* du,
float* x,
int batchCount,
int batchStride,
void* pBuffer);

cusparseStatus_t
cusparseDgtsv2StridedBatch(cusparseHandle_t handle,
int m,
const double* dl,
const double* d,
const double* du,
double* x,
int batchCount,
int batchStride,
void* pBuffer);

cusparseStatus_t
cusparseCgtsv2StridedBatch(cusparseHandle_t handle,
int m,
const cuComplex* dl,
const cuComplex* d,
const cuComplex* du,
cuComplex* x,
int batchCount,
int batchStride,
void* pBuffer);

cusparseStatus_t
cusparseZgtsv2StridedBatch(cusparseHandle_t handle,
```
This function computes the solution of multiple tridiagonal linear systems for \(i=0, \ldots, \) \(\text{batchCount}\):

\[
A^{i0} \cdot y^{i0} = x^{i0}
\]

The coefficient matrix \(A\) of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower \(d_{l}\), main \(d_{m}\), and upper \(d_{u}\) matrix diagonals; the right-hand sides are stored in the dense matrix \(X\). Notice that solution \(Y\) overwrites right-hand-side matrix \(X\) on exit. The different matrices are assumed to be of the same size and are stored with a fixed \(\text{batchStride}\) in memory.

The routine does not perform any pivoting and uses a combination of the Cyclic Reduction (CR) and the Parallel Cyclic Reduction (PCR) algorithms to find the solution. It achieves better performance when \(m\) is a power of 2.

This function requires a buffer size returned by \(\text{gtsv2StridedBatch\_bufferSizeExt}\()\). The address of \(pBuffer\) must be multiple of 128 bytes. If it is not, \(\text{CUSPARSE\_STATUS\_INVALID\_VALUE}\) is returned.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

<tr>
<td><code>cusparseZgtsvInterleavedBatch</code></td>
<td>`cusparseHandle_t handle, int algo, int m, cuDoubleComplex* dl, cuDoubleComplex* d, cuDoubleComplex* du, cuDoubleComplex* x, int batchCount, void* pBuffer)</td>
</tr>
</tbody>
</table>
This function computes the solution of multiple tridiagonal linear systems for $i=0, \ldots, \text{batchCount}$:

$$A^{(i)} \cdot x^{(i)} = b^{(i)}$$

The coefficient matrix $A$ of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower ($dl$), main ($d$), and upper ($du$) matrix diagonals; the right-hand sides are stored in the dense matrix $B$. Notice that solution $X$ overwrites right-hand-side matrix $B$ on exit.

Assuming $A$ is of size $m$ and base-1, $dl$, $d$ and $du$ are defined by the following formula:

- $dl(i) := A(i, i-1)$ for $i=1,2,\ldots,m$  
  The first element of $dl$ is out-of-bound ($dl(1) := A(1,0)$), so $dl(1) = 0$.
- $d(i) = A(i,i)$ for $i=1,2,\ldots,m$  
- $du(i) = A(i,i+1)$ for $i=1,2,\ldots,m$  
  The last element of $du$ is out-of-bound ($du(m) := A(m,m+1)$), so $du(m) = 0$.

The data layout is different from $\text{gtsvStridedBatch}$ which aggregates all matrices one after another. Instead, $\text{gtsvInterleavedBatch}$ gathers different matrices of the same element in a continuous manner. If $dl$ is regarded as a 2-D array of size $m$-by-$\text{batchCount}$, $dl(:,j)$ to store $j$-th matrix. $\text{gtsvStridedBatch}$ uses column-major while $\text{gtsvInterleavedBatch}$ uses row-major.

The routine provides three different algorithms, selected by parameter $\text{algo}$. The first algorithm is $\text{cuThomas}$ provided by Barcelona Supercomputing Center. The second algorithm is LU with partial pivoting and last algorithm is QR. From stability perspective, $\text{cuThomas}$ is not numerically stable because it does not have pivoting. LU with partial pivoting and QR are stable. From performance perspective, LU with partial pivoting and QR is about 10% to 20% slower than $\text{cuThomas}$.

This function requires a buffer size returned by $\text{gtsvInterleavedBatch\_bufferSizeExt()}$. The address of $\text{pBuffer}$ must be multiple of 128 bytes. If it is not, CUSPARSE\_STATUS\_INVALID\_VALUE is returned.

If the user prepares aggregate format, one can use $\text{cublasXgeam}$ to get interleaved format. However such transformation takes time comparable to solver itself. To reach best performance, the user must prepare interleaved format explicitly.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

  int m,
  cuComplex* ds,
This function computes the solution of multiple penta-diagonal linear systems for $i=0, \ldots, \text{batchCount}$:

$$A^{\theta} x^{\theta} = b^{\theta}$$

The coefficient matrix $A$ of each of these penta-diagonal linear system is defined with five vectors corresponding to its lower $\{ds, \ dl\}$, main $\{d\}$, and upper $\{du, \ dw\}$ matrix diagonals; the right-hand sides are stored in the dense matrix $B$. Notice that solution $X$ overwrites right-hand-side matrix $B$ on exit.

Assuming $A$ is of size $m$ and base-1, $ds, dl, d, du$ and $dw$ are defined by the following formula:

$ds(i) := A(i, i-2)$ for $i=1,2,\ldots,m$

The first two elements of $ds$ is out-of-bound ($ds(1) := A(1,-1), ds(2) := A(2,0)$), so $ds(1) = 0$ and $ds(2) = 0$.

$dl(i) := A(i, i-1)$ for $i=1,2,\ldots,m$

The first element of $dl$ is out-of-bound ($dl(1) := A(1,0)$), so $dl(1) = 0$.

$d(i) = A(i,i)$ for $i=1,2,\ldots,m$

$du(i) = A(i, i+1)$ for $i=1,2,\ldots,m$

The last element of $du$ is out-of-bound ($du(m) := A(m,m+1)$), so $du(m) = 0$.

$dw(i) = A(i, i+2)$ for $i=1,2,\ldots,m$

The last two elements of $dw$ is out-of-bound ($dw(m-1) := A(m-1, m+1), dw(m) := A(m,m+2)$), so $dw(m-1) = 0$ and $dw(m) = 0$.

The data layout is the same as $\text{gtsvStridedBatch}$.

The routine is numerically stable because it uses QR to solve the linear system.

This function requires a buffer size returned by $\text{gpsvInterleavedBatch\_bufferSizeExt()}$. The address of $pBuffer$ must be multiple of 128 bytes. If it is not, $\text{CUSPARSE\_STATUS\_INVALID\_VALUE}$ is returned.
Appendix section shows an example of `gpsvInterleavedBatch`. If the user prepares aggregate format, one can use `cublasXgeam` to get interleaved format. However such transformation takes time comparable to solver itself. To reach best performance, the user must prepare interleaved format explicitly.

The function supports the following properties if `pBuffer != NULL`:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

This function performs the coloring of the adjacency graph associated with the matrix A stored in CSR format. The coloring is an assignment of colors (integer numbers) to nodes, such that neighboring nodes have distinct colors. An approximate coloring algorithm is used in this routine, and is stopped when a certain percentage of nodes has been colored. The rest of the nodes are assigned distinct colors (an increasing sequence of integers numbers, starting from the last integer used previously). The last two auxiliary routines can be used to extract the resulting number of colors, their assignment and the associated reordering. The reordering is such that nodes that have been assigned the same color are reordered to be next to each other.

The matrix A passed to this routine, must be stored as a general matrix and have a symmetric sparsity pattern. If the matrix is nonsymmetric the user should pass A+A^T as a parameter to this routine.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

### Input

13.1. cusparse<t>bsr2csr()

cusparseStatus_t cusparse<t>bsr2csr(cusparseHandle_t handle, cusparseDirection_t dir, int mb, int nb, const cusparseMatDescr_t descrA, const float* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int blockDim, const cusparseMatDescr_t descrC, float* csrValC, int* csrRowPtrC, int* csrColIndC)

cusparseStatus_t cusparseDbsr2csr(cusparseHandle_t handle, cusparseDirection_t dir, int mb, int nb, const cusparseMatDescr_t descrA, const double* bsrValA,
This function converts a sparse matrix in BSR format that is defined by the three arrays
`bsrValA`, `bsrRowPtrA`, and `bsrColIndA`) into a sparse matrix in CSR format that is defined by
arrays `csrValC`, `csrRowPtrC`, and `csrColIndC`.

Let `m (=mb*blockDim)` be the number of rows of `A` and `n (=nb*blockDim)` be number
of columns of `A`, then `A` and `C` are `m*n` sparse matrices. The BSR format of `A` contains
`nnzb (=bsrRowPtrA[mb] - bsrRowPtrA[0])` nonzero blocks, whereas the sparse matrix `A`
contains `nnz (=nnzb*blockDim*blockDim)` elements. The user must allocate enough space
for arrays `csrRowPtrC`, `csrColIndC`, and `csrValC`. The requirements are as follows:

- `csrRowPtrC` of `m+1` elements
- `csrValC` of `nnz` elements
- `csrColIndC` of `nnz` elements

The general procedure is as follows:

```c
// Given BSR format (bsrRowPtrA, bsrColIndA, bsrValA) and
// blocks of BSR format are stored in column-major order.
cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int m = mb*blockDim;
int nnzb = bsrRowPtrA[mb] - bsrRowPtrA[0]; // number of blocks
int nnz = nnzb * blockDim * blockDim; // number of elements
```
The routine requires no extra storage

The routine does not support asynchronous execution if blockDim == 1

The routine does not support CUDA graph capture if blockDim == 1

Input

| handle | handle to the cuSPARSE library context. |
| dir | storage format of blocks, either CUSPARSE_DIRECTION_ROW or CUSPARSE_DIRECTION_COLUMN. |
| mb | number of block rows of sparse matrix A. |
| nb | number of block columns of sparse matrix A. |
| descrA | the descriptor of matrix A. |
| bsrValA | <type> array of nnzb*blockDim*blockDim nonzero elements of matrix A. |
| bsrRowPtrA | integer array of mb+1 elements that contains the start of every block row and the end of the last block row plus one of matrix A. |
| bsrColIndA | integer array of nnzb column indices of the nonzero blocks of matrix A. |
| blockDim | block dimension of sparse matrix A. |
| descrC | the descriptor of matrix C. |

Output

| csrValC | <type> array of nnz (=csrRowPtrC[m] - csrRowPtrC[0]) nonzero elements of matrix C. |
| csrRowPtrC | integer array of m+1 elements that contains the start of every row and the end of the last row plus one of matrix C. |
| csrColIndC | integer array of nnz column indices of the nonzero elements of matrix C. |

See cusparseStatus_t for the description of the return status

13.2. cusparse<t>gebsr2gebsc()
cusparseStatus_t cusparseDgebsr2gebsc_bufferSize(cusparseHandle_t handle, int mb, int nb, int nnzb, const double* bsrVal, const int* bsrRowPtr, const int* bsrColInd, int rowBlockDim, int colBlockDim, int* pBufferSize)

cusparseStatus_t cusparseCgebsr2gebsc_bufferSize(cusparseHandle_t handle, int mb, int nb, int nnzb, const cuComplex* bsrVal, const int* bsrRowPtr, const int* bsrColInd, int rowBlockDim, int colBlockDim, int* pBufferSize)

cusparseStatus_t cusparseZgebsr2gebsc_bufferSize(cusparseHandle_t handle, int mb, int nb, int nnzb, const cuDoubleComplex* bsrVal, const int* bsrRowPtr, const int* bsrColInd, int rowBlockDim, int colBlockDim, int* pBufferSize)

cusparseStatus_t cusparseSgebsr2gebsc(cusparseHandle_t handle, int mb, int nb, int nnzb, const float* bsrVal, const int* bsrRowPtr, const int* bsrColInd, int rowBlockDim, int colBlockDim, float* bscVal, int* bscRowInd, int* bscColPtr, cusparseAction_t copyValues, cusparseIndexBase_t baseIdx,
```c
void* pBuffer)
cusparseStatus_t cusparseDgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const double* bsrVal,
    const int* bsrRowPtr,
    const int* bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    double* bscVal,
    int* bscRowInd,
    int* bscColPtr,
    cusparseAction_t copyValues,
    cusparseIndexBase_t baseIdx,
    void* pBuffer)

cusparseStatus_t cusparseCgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const cuComplex* bsrVal,
    const int* bsrRowPtr,
    const int* bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    cuComplex* bscVal,
    int* bscRowInd,
    int* bscColPtr,
    cusparseAction_t copyValues,
    cusparseIndexBase_t baseIdx,
    void* pBuffer)

cusparseStatus_t cusparseZgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const cuDoubleComplex* bsrVal,
    const int* bsrRowPtr,
    const int* bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    cuDoubleComplex* bscVal,
    int* bscRowInd,
    int* bscColPtr,
    cusparseAction_t copyValues,
    cusparseIndexBase_t baseIdx,
    void* pBuffer)
```

This function can be seen as the same as `csr2csc()` when each block of size `rowBlockDim*colBlockDim` is regarded as a scalar.

This sparsity pattern of the result matrix can also be seen as the transpose of the original sparse matrix, but the memory layout of a block does not change.

The user must call `gebsr2gebsc_bufferSize()` to determine the size of the buffer required by `gebsr2gebsc()`, allocate the buffer, and pass the buffer pointer to `gebsr2gebsc()`.
The routine requires no extra storage if pBuffer != NULL
The routine does not support asynchronous execution
The routine does not support CUDA graph capture

</table>
This function converts a sparse matrix in general BSR format that is defined by the three arrays `bsrValA`, `bsrRowPtrA`, and `bsrColIndA` into a sparse matrix in another general BSR format that is defined by arrays `bsrValC`, `bsrRowPtrC`, and `bsrColIndC`.

If `rowBlockDimA` is a multiple of `rowBlockDimC` and `colBlockDimA` is a multiple of `colBlockDimC`, `cusparse[S|D|C|Z]gebsr2gebsr()` is the same as `cusparse[S|D|C|Z]csr2gebsr()`.

If `rowBlockDimC` is a multiple of `rowBlockDimA` and `colBlockDimC` is a multiple of `colBlockDimA`, `cusparse[S|D|C|Z]gebsr2gebsr()` is the same as `cusparse[S|D|C|Z]gebsr2csr()`.

A is an m*n sparse matrix where m (= mb*rowBlockDim) is the number of rows of A, and n (= nb*colBlockDim) is the number of columns of A. The general BSR format of A contains nnzb (= bsrRowPtrA[mb] - bsrRowPtrA[0]) nonzero blocks. The matrix C is also general BSR format with a different block size, rowBlockDimC*colBlockDimC. If m is not a multiple of rowBlockDimC, or n is not a multiple of colBlockDimC, zeros are filled in. The number of block rows of C is mc (= (m+rowBlockDimC-1)/rowBlockDimC). The number of block columns of C is nc (= (n+colBlockDimC-1)/colBlockDimC). The number of nonzero blocks of C is nnzc.

The implementation adopts a two-step approach to do the conversion. First, the user allocates `bsrRowPtrC` of `mc+1` elements and uses function `cusparseXgebsr2gebsrNnz()`.
to determine the number of nonzero block columns per block row of matrix \( C \). Second, the user gathers \( \text{nnzc} \) [number of non-zero block columns of matrix \( C \)] from either 

\( \text{nnzc} = *\text{nnzTotalDevHostPtr} \) or 

\( \text{nnzc} = \text{bsrRowPtrC}[\text{mc}] - \text{bsrRowPtrC}[0] \) and allocates \( \text{bsrValC} \) of \( \text{nnzc} \times \text{rowBlockDimC} \times \text{colBlockDimC} \) elements and \( \text{bsrColIndC} \) of \( \text{nnzc} \) integers. Finally the function `cusparse[S|D|C|Z]gebsr2gebsr()` is called to complete the conversion.

The user must call `gebsr2gebsr_bufferSize()` to know the size of the buffer required by `gebsr2gebsr()`, allocate the buffer, and pass the buffer pointer to `gebsr2gebsr()`.

The general procedure is as follows:

```c
// Given general BSR format (bsrRowPtrA, bsrColIndA, bsrValA) and 
// blocks of BSR format are stored in column-major order.

cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;

13.4. `cusparse<t>gebsr2csr()`

cusparseStatus_t cusparseSgebsr2csr(cusparseHandle_t handle, cusparseDirection_t dir, int mb, int nb, const cusparseMatDescr_t descrA, const float* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int rowBlockDim, int colBlockDim, const cusparseMatDescr_t descrC, float* csrValC, int* csrRowPtrC, int* csrColIndC)

cusparseStatus_t cusparseDgebsr2csr(cusparseHandle_t handle, cusparseDirection_t dir, int mb, int nb, const cusparseMatDescr_t descrA, const double* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int rowBlockDim, int colBlockDim, const cusparseMatDescr_t descrC, double* csrValC, int* csrRowPtrC, int* csrColIndC)

cusparseStatus_t cusparseCgebsr2csr(cusparseHandle_t handle, cusparseDirection_t dir, int mb, int nb, const cusparseMatDescr_t descrA, const cuComplex* bsrValA, const int* bsrRowPtrA, const int* bsrColIndA, int rowBlockDim, int colBlockDim, const cusparseMatDescr_t descrC, cuComplex* csrValC, int* csrRowPtrC, int* csrColIndC)

cusparseStatus_t cusparseZgebsr2csr(cusparseHandle_t handle, cusparseDirection_t dir, int mb, int nb, const cusparseMatDescr_t descrA,
This function converts a sparse matrix in general BSR format that is defined by the three arrays bsrValA, bsrRowPtrA, and bsrColIndA into a sparse matrix in CSR format that is defined by arrays csrValC, csrRowPtrC, and csrColIndC.

Let \( m(=mb \times \text{rowBlockDim}) \) be the number of rows of \( A \) and \( n(=nb \times \text{colBlockDim}) \) be the number of columns of \( A \), then \( A \) and \( C \) are \( m \times n \) sparse matrices. The general BSR format of \( A \) contains \( \text{nnzb} = \text{bsrRowPtrA}[mb] - \text{bsrRowPtrA}[0] \) non-zero blocks, whereas sparse matrix \( A \) contains \( \text{nnz} = \text{nnzb} \times \text{rowBlockDim} \times \text{colBlockDim} \) elements. The user must allocate enough space for arrays csrRowPtrC, csrColIndC, and csrValC. The requirements are as follows:

- \( \text{csrRowPtrC} \) of \( m+1 \) elements
- \( \text{csrValC} \) of \( \text{nnz} \) elements
- \( \text{csrColIndC} \) of \( \text{nnz} \) elements

The general procedure is as follows:

```c
// Given general BSR format (bsrRowPtrA, bsrColIndA, bsrValA) and
// blocks of BSR format are stored in column-major order.
cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int m = mb*rowBlockDim;
int n = nb*colBlockDim;
int nnzb = bsrRowPtrA[mb] - bsrRowPtrA[0]; // number of blocks
int nnz  = nnzb * rowBlockDim * colBlockDim; // number of elements
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
cudaMalloc((void**)&csrColIndC, sizeof(int)*nnz);
cudaMalloc((void**)&csrValC, sizeof(float)*nnz);
cusparseSgebsr2csr(handle, dir, mb, nb,
                   descrA,
                   bsrValA, bsrRowPtrA, bsrColIndA,
                   rowBlockDim, colBlockDim,
                   descrC,
                   csrValC, csrRowPtrC, csrColIndC);
```

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

<td>Convert CSR to GEBSR format.</td>
</tr>
</tbody>
</table>
This function converts a sparse matrix $A$ in CSR format (that is defined by arrays $csrValA$, $csrRowPtrA$, and $csrColIndA$) into a sparse matrix $C$ in general BSR format (that is defined by the three arrays $bsrValC$, $bsrRowPtrC$, and $bsrColIndC$).
The matrix $A$ is a $m \times n$ sparse matrix and matrix $C$ is a $(mb \times colBlockDim) \times (nb \times colBlockDim)$ sparse matrix, where $mb = (m + rowBlockDim - 1)/rowBlockDim$ is the number of block rows of $C$, and $nb = (n + colBlockDim - 1)/colBlockDim$ is the number of block columns of $C$.

The block of $C$ is of size $rowBlockDim \times colBlockDim$. If $m$ is not multiple of $rowBlockDim$ or $n$ is not multiple of $colBlockDim$, zeros are filled in.

The implementation adopts a two-step approach to do the conversion. First, the user allocates $bsrRowPtrC$ of $mb+1$ elements and uses function $cusparseXcsr2gebsrNnz()$ to determine the number of nonzero block columns per block row. Second, the user gathers $nnzb$ (number of nonzero block columns of matrix $C$) from either ($nnzb=*nnzTotalDevHostPtr$) or ($nnzb=bsrRowPtrC[mb]-bsrRowPtrC[0]$) and allocates $bsrValC$ of $nnzb \times rowBlockDim \times colBlockDim$ elements and $bsrColIndC$ of $nnzb$ integers. Finally function $cusparse[S|D|C|Z]csr2gebsr()$ is called to complete the conversion.

The user must obtain the size of the buffer required by $csr2gebsr()$ by calling $csr2gebsr_bufferSize()$, allocate the buffer, and pass the buffer pointer to $csr2gebsr()$.

The general procedure is as follows:

```c
// Given CSR format (csrRowPtrA, csrColIndA, csrValA) and
// blocks of BSR format are stored in column-major order.

cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int base, nnzb;
int mb = (m + rowBlockDim-1)/rowBlockDim;
int nb = (n + colBlockDim-1)/colBlockDim;
int bufferSize;
void *pBuffer;

cusparseScsr2gebsr_bufferSize(handle, dir, m, n,
    descrA, csrValA, csrRowPtrA, csrColIndA,
    rowBlockDim, colBlockDim,
    &bufferSize);

cudaMalloc((void**)&pBuffer, bufferSize);

cudaMalloc((void**)&bsrRowPtrC, sizeof(int) *(mb+1));

// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzb;

cusparseXcsr2gebsrNnz(handle, dir, m, n,
    descrA, csrRowPtrA, csrColIndA,
    descrC, bsrRowPtrC, rowBlockDim, colBlockDim,
    nnzTotalDevHostPtr, pBuffer);

if (NULL != nnzTotalDevHostPtr){
    nnzb = *nnzTotalDevHostPtr;
} else{
    cudaMemcpy(&nnzb, bsrRowPtrC+mb, sizeof(int), cudaMemcpyDeviceToHost);
    cudaMemcpy(&base, bsrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
    nnzb -= base;
}

cudaMalloc((void**)&bsrColIndC, sizeof(int)*nnzb);

cudaMalloc((void**)&bsrValC, sizeof(float)*(rowBlockDim*colBlockDim)*nnzb);

cusparseScsr2gebsr(handle, dir, m, n,
    descrA,
    csrValA, csrRowPtrA, csrColIndA,
    descrC,
    bsrValC, bsrRowPtrC, bsrColIndC,
    rowBlockDim, colBlockDim,
    pBuffer);
```

The routine $cusparseXcsr2gebsrNnz()$ has the following properties:

- The routine requires no extra storage
- The routine does not support asynchronous execution
- The routine does **not** support CUDA graph capture

The routine `cusparse<t>csr2gebsr()` has the following properties:

- The routine requires no extra storage if `pBuffer` != NULL
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

nnzTotalDevHostPtr | total number of nonzero blocks of matrix C. Pointer nnzTotalDevHostPtr can point to a device memory or host memory.

See `cusparseStatus_t` for the description of the return status

13.6. cusparse<

cusparseStatus_t
cusparseXcoo2csr(cusparseHandle_t handle,
const int* cooRowInd,
int nnz,
int m,
int* csrRowPtr,
cusparseIndexBase_t idxBase)

This function converts the array containing the uncompressed row indices (corresponding to COO format) into an array of compressed row pointers (corresponding to CSR format).

It can also be used to convert the array containing the uncompressed column indices (corresponding to COO format) into an array of column pointers (corresponding to CSC format).

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

Input

<table>

See [cusparseStatus_t](#) for the description of the return status

### 13.8. `cusparse<t>csr2bsr()`

```c

```
This function converts a sparse matrix in CSR format that is defined by the three arrays `csrValA`, `csrRowPtrA`, and `csrColIndA` into a sparse matrix in BSR format that is defined by arrays `bsrValC`, `bsrRowPtrC`, and `bsrColIndC`.

A is an m*n sparse matrix. The BSR format of A has mb block rows, nb block columns, and nnzb nonzero blocks, where mb=((m+blockDim-1)/blockDim) and nb=(n+blockDim-1)/blockDim.
If \(m\) or \(n\) is not multiple of \(\text{blockDim}\), zeros are filled in.

The conversion in cuSPARSE entails a two-step approach. First, the user allocates \(\text{bsrRowPtrC}\) of \(m+1\) elements and uses function \(\text{cusparseXcsr2bsrNnz()}\) to determine the number of nonzero block columns per block row. Second, the user gathers \(\text{nnzb}\) (number of non-zero block columns of matrix \(C\)) from either \((\text{nnzb}=\*\text{nnzTotalDevHostPtr})\) or \((\text{nnzb}=\text{bsrRowPtrC}[mb]-\text{bsrRowPtrC}[0])\) and allocates \(\text{bsrValC}\) of \(\text{nnzb}\times\text{blockDim}\times\text{blockDim}\) elements and \(\text{bsrColIndC}\) of \(\text{nnzb}\) elements. Finally function \(\text{cusparse[S|D|C|Z]csr2bsr90}\) is called to complete the conversion.

The general procedure is as follows:

```c
// Given CSR format (csrRowPtrA, csrColIndA, csrValA) and
// blocks of BSR format are stored in column-major order.

cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int base, nnzb;
int mb = (m + blockDim-1)/blockDim;
cudaMalloc((void**)&bsrRowPtrC, sizeof(int) *(mb+1));
int *nnzTotalDevHostPtr = &nnzb;
cusparseXcsr2bsrNnz(handle, dir, m, n,
  descrA, csrRowPtrA, csrColIndA,
  blockDim, descrC, bsrRowPtrC,
  nnzTotalDevHostPtr);
if (NULL != nnzTotalDevHostPtr){
  nnzb = *nnzTotalDevHostPtr;
} else{
  cudaMemcpy(&nnzb, bsrRowPtrC+mb, sizeof(int), cudaMemcpyDeviceToHost);
  cudaMemcpy(&base, bsrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
  nnzb -= base;
}
cudaMalloc((void**)&bsrColIndC, sizeof(int)*nnzb);
cudaMalloc((void**)&bsrValC, sizeof(float)*(blockDim*blockDim)*nnzb);
cusparseScsr2bsr(handle, dir, m, n,
  descrA, csrValA, csrRowPtrA, csrColIndA,
  blockDim, descrC,
  bsrValC, bsrRowPtrC, bsrColIndC);
```

The routine \(\text{cusparse<t>csr2bsr()}\) has the following properties:

- This function requires temporary extra storage that is allocated internally if \(\text{blockDim} > 16\)
- The routine does not support asynchronous execution if \(\text{blockDim} == 1\)
- The routine does not support CUDA graph capture if \(\text{blockDim} == 1\)

The routine \(\text{cusparseXcsr2bsrNnz()}\) has the following properties:

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

<td>block dimension of sparse matrix A. The range of blockDim is between 1 and (\min(m,n)).</td>
</tr>
<tr>
<td>descrC</td>
<td>the descriptor of matrix C.</td>
</tr>
</tbody>
</table>

### Output

| bsrValC     | <type> array of \(\text{nnzb} \times \text{blockDim} \times \text{blockDim}\) nonzero elements of matrix C. |
| bsrRowPtrC  | integer array of \(m+b+1\) elements that contains the start of every block row and the end of the last block row plus one of matrix C. |
| bsrColIndC  | integer array of \(\text{nnzb}\) column indices of the non-zero blocks of matrix C. |
| nnzTotalDevHostPtr | total number of nonzero elements in device or host memory. It is equal to \(\text{bsrRowPtr}_C[m] - \text{bsrRowPtr}_C[0]\). |

See **cusparseStatus_t** for the description of the return status

### 13.9. cusparse<t>csr2coo()

```cpp
cusparsestatus_t cusparseXcsr2coo(cusparseHandle_t handle, const int*csrRowPtr,
                                    int.nnz,
                                    int.m,
                                    int*cooRowInd,
                                    cusparseIndexBase_t idxBase)
```

This function converts the array containing the compressed row pointers (corresponding to CSR format) into an array of uncompressed row indices (corresponding to COO format).

It can also be used to convert the array containing the compressed column indices (corresponding to CSC format) into an array of uncompressed column indices (corresponding to COO format).
The routine requires no extra storage
The routine supports asynchronous execution
The routine supports CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>csrRowPtr</td>
<td>integer array of ( m+1 ) elements that contains the start of every row and the end of the last row plus one.</td>
</tr>
<tr>
<td>nnz</td>
<td>number of nonzeros of the sparse matrix (that is also the length of array cooRowInd).</td>
</tr>
<tr>
<td>m</td>
<td>number of rows of matrix ( A ).</td>
</tr>
<tr>
<td>idxBase</td>
<td>CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.</td>
</tr>
</tbody>
</table>

**Output**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cooRowInd</td>
<td>integer array of ( nnz ) uncompressed row indices.</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status

### 13.10. cusparseCsr2cscEx2()

cusparseStatus_t cusparseCsr2cscEx2(cusparseHandle_t handle, int m, int n, int nnz, const void* csrVal, const int* csrRowPtr, const int* csrColInd, void* cscVal, int* cscColPtr, int* cscRowInd, cudaDataType valType, cusparseAction_t copyValues, cusparseIndexBase_t idxBase, cusparseCsr2CscAlg_t alg, size_t* bufferSize)

cusparseStatus_t cusparseCsr2cscEx2_bufferSize(cusparseHandle_t handle, int m, int n, int nnz, const void* csrVal, const int* csrRowPtr, const int* csrColInd, void* cscVal, int* cscColPtr, int* cscRowInd, cudaDataType valType, cusparseAction_t copyValues, cusparseIndexBase_t idxBase, cusparseCsr2CscAlg_t alg, size_t* bufferSize)
This function converts a sparse matrix in CSR format (that is defined by the three arrays `csrVal`, `csrRowPtr`, and `csrColInd`) into a sparse matrix in CSC format (that is defined by arrays `cscVal`, `cscRowInd`, and `cscColPtr`). The resulting matrix can also be seen as the transpose of the original sparse matrix. Notice that this routine can also be used to convert a matrix in CSC format into a matrix in CSR format.

For `alg` `CUSPARSE_CSR2CSC_ALG1`: it requires extra storage proportional to the number of nonzero values `nnz`. It provides in output always the same matrix.

For `alg` `CUSPARSE_CSR2CSC_ALG2`: it requires extra storage proportional to the number of rows `m`. It does not ensure always the same ordering of CSC column indices and values. Also, it provides better performance then `CUSPARSE_CSR2CSC_ALG1` for regular matrices.

It is executed asynchronously with respect to the host, and it may return control to the application on the host before the result is ready.

The function `cusparseCsr2cscEx2_bufferSize()` returns the size of the workspace needed by `cusparseCsr2cscEx2()`. User needs to allocate a buffer of this size and give that buffer to `cusparseCsr2cscEx2()` as an argument.

If `nnz == 0`, then `csrColInd`, `csrVal`, `cscVal`, and `cscRowInd` could have NULL value. In this case, `cscColPtr` is set to `idxBase` for all values.

If `m == 0` or `n == 0`, the pointers are not checked and the routine returns `CUSPARSE_STATUS_SUCCESS`.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine does **not** support CUDA graph capture

### Input

<table>
<thead>
<tr>
<th><strong>handle</strong></th>
<th>handle to the cuSPARSE library context</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>m</strong></td>
<td>number of rows of the CSR input matrix; number of columns of the CSC output matrix</td>
</tr>
<tr>

### 13.11. `cusparse<t>csr2dense()` [DEPRECATED]

[[DEPRECATED]] use `cusparseSparse2Dense()` instead. *The routine will be removed in the next major release.*

```c
cusparseStatus_t cusparseScsr2dense(cusparseHandle_t         handle,
                                   int                      m,
                                   int                      n,
                                   const cusparseMatDescr_t descrA,
                                   const float*             csrValA,
                                   const int*               csrRowPtrA,
                                   const int*               csrColIndA,
                                   float*                   A,
                                   int                      lda)

cusparseStatus_t cusparseDcsr2dense(cusparseHandle_t         handle,
                                   int                      m,
                                   int                      n,
                                   const cusparseMatDescr_t descrA,
                                   const double*            csrValA,
                                   const int*               csrRowPtrA,
                                   const int*               csrColIndA,
                                   double*                  A,
                                   int                      lda)

cusparseStatus_t cusparseCcsr2dense(cusparseHandle_t         handle,
                                   int                      m,
                                   int                      n,
                                   const cusparseMatDescr_t descrA,
                                   const cuComplex*         csrValA,
                                   const cuComplex*         csrRowPtrA,
                                   const cuComplex*         csrColIndA,
                                   cuComplex*               A,
                                   int                      lda)
```
This function converts the sparse matrix in CSR format (that is defined by the three arrays `csrValA`, `csrRowPtrA`, and `csrColIndA`) into the matrix `A` in dense format. The dense matrix `A` is filled in with the values of the sparse matrix and with zeros elsewhere.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

    const cusparseMatDescr_t descrA,
    const cuDoubleComplex* csrValA,
    const int* csrColIndA,
    const int* csrRowPtrA,
    int nnzA,
    const int* nnzPerRow,
This function compresses the sparse matrix in CSR format into compressed CSR format. Given a sparse matrix $A$ and a non-negative value threshold, the function returns a sparse matrix $C$, defined by

$$C(i,j) = A(i,j) \text{ if } |A(i,j)| > |\text{threshold}|$$

The implementation adopts a two-step approach to do the conversion. First, the user allocates $\text{csrRowPtrC}$ of $m+1$ elements and uses function `cusparse<t>nnz_compress()` to determine $\text{nnzPerRow}$ (the number of nonzeros columns per row) and $\text{nnzC}$ (the total number of nonzeros). Second, the user allocates $\text{csrValC}$ of $\text{nnzC}$ elements and $\text{csrColIndC}$ of $\text{nnzC}$ integers. Finally function `cusparse<t>csr2csr_compress()` is called to complete the conversion.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

### 13.13. cusparse<t>dense2csc()

[[DEPRECATED]] use **cusparseDense2Sparse()** instead. *The routine will be removed in the next major release*

```c

cusparseStatus_t
cusparseDense2csc(cusparseHandle_t handle,
int m,
int n,
const cusparseMatDescr_t descrA,
const float* A,
int lda,
const int* nnzPerCol,
float* cscValA,
int* cscRowIndA,
int* cscColPtrA)
```
This function converts the matrix $A$ in dense format into a sparse matrix in CSC format. All the parameters are assumed to have been pre-allocated by the user, and the arrays are filled in based on $\text{nnzPerCol}$, which can be precomputed with $\text{cusparse<t>nnz()}$.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
<tr>
<td>$m$</td>

</tr>
<tr>
<td>$n$</td>
<td>number of columns of matrix $A$.</td>
</tr>
<tr>
<td>descrA</td>
<td>the descriptor of matrix $A$. The supported matrix type is \text{CUSPARSE_MATRIX_TYPE_GENERAL}. Also, the supported index bases are \text{CUSPARSE_INDEX_BASE_ZERO} and \text{CUSPARSE_INDEX_BASE_ONE}.</td>
</tr>
<tr>
<td>$A$</td>
<td>array of dimensions $(\text{lda}, n)$.</td>
</tr>
</tbody>
</table>
### lda
leading dimension of dense array A.

### nnzPerCol
array of size n containing the number of nonzero elements per column.

### Output

| cscValA | <type> array of nnz (= cscRowPtrA(m) - cscRowPtrA(0)) nonzero elements of matrix A. It is only filled in if copyValues is set to CUSPARSE_ACTION_NUMERIC. |
| cscRowIndA | integer array of nnz (= cscRowPtrA(m) - cscRowPtrA(0)) row indices of the nonzero elements of matrix A. |
| cscColPtrA | integer array of n+1 elements that contains the start of every column and the end of the last column plus one. |

See [cusparseStatus_t](#) for the description of the return status

### 13.14. cusparse<t>dense2csr()

[DEPRECATED]

[[DEPRECATED]] use [cusparseDense2Sparse()](#) instead. The routine will be removed in the next major release

```c

cusparseStatus_t
cusparseDdense2csr(cusparseHandle_t handle, int m, int n, const cusparseMatDescr_t descrA, const float* A, int lda, const int* nnzPerRow, float* csrValA, int* csrRowPtrA, int* csrColIndA)

cusparseStatus_t
cusparseDdense2csr(cusparseHandle_t handle, int m, int n, const cusparseMatDescr_t descrA, const double* A, int lda, const int* nnzPerRow, double* csrValA, int* csrRowPtrA, int* csrColIndA)

cusparseStatus_t
cusparseCdense2csr(cusparseHandle_t handle, int m, int n)
```
This function converts the matrix $A$ in dense format into a sparse matrix in CSR format. All the parameters are assumed to have been pre-allocated by the user and the arrays are filled in based on $\text{nnzPerRow}$, which can be pre-computed with $\text{cusparse<t>nnz()}$.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

See `cusparseStatus_t` for the description of the return status

13.16. `cusparseCreateIdentityPermutation()`

cusparseStatus_t cusparseCreateIdentityPermutation(cusparseHandle_t handle, int n, int* p);

This function creates an identity map. The output parameter `p` represents such map by `p = 0:1:(n-1)`.

This function is typically used with `coosort`, `csrsort`, `cscsort`.

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

Input

<table>
<thead>
<tr>
<th>parameter</th>
<th>device or host</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>host</td>
<td>handle to the cuSPARSE library context.</td>
</tr>
</tbody>
</table>
n  host  size of the map.

Output

<table>

</thead>
<tbody>
<tr>
<td>p</td>
<td>device</td>
<td>integer array of dimensions n.</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status

## 13.17. cusparseXcoosort()

```c

cusparseStatus_t
cusparseXcoosort_bufferSizeExt(cusparseHandle_t handle,
int m,
int n,
int nnz,
const int* cooRows,
const int* cooCols,
size_t* pBufferSizeInBytes)
```

```c

cusparseStatus_t
cusparseXcoosortByRow(cusparseHandle_t handle,
int m,
int n,
int nnz,
int* cooRows,
int* cooCols,
int* P,
void* pBuffer)
```

```c

cusparseStatus_t
cusparseXcoosortByColumn(cusparseHandle_t handle,
int m,
int n,
int nnz,
int* cooRows,
int* cooCols,
int* P,
void* pBuffer);
```

This function sorts COO format. The sorting is in-place. Also the user can sort by row or sort by column.

A is an \( m \times n \) sparse matrix that is defined in COO storage format by the three arrays `cooVals`, `cooRows`, and `cooCols`.

There is no assumption for the base index of the matrix. `coosort` uses stable sort on signed integer, so the value of `cooRows` or `cooCols` can be negative.

This function `coosort()` requires buffer size returned by `coosort_bufferSizeExt()`. The address of `pBuffer` must be multiple of 128 bytes. If not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.
The parameter \( P \) is both input and output. If the user wants to compute sorted \( \text{cooVal} \), \( P \) must be set as \( 0:1:([\text{nnz}-1]) \) before \( \text{coosort()} \), and after \( \text{coosort()} \), new sorted value array satisfies \( \text{cooVal\_sorted} = \text{cooVal}(P) \).

Remark: the dimension \( m \) and \( n \) are not used. If the user does not know the value of \( m \) or \( n \), just passes a value positive. This usually happens if the user only reads a COO array first and needs to decide the dimension \( m \) or \( n \) later.

Appendix section provides a simple example of \( \text{coosort()} \).

- The routine requires no extra storage if \( \text{pBuffer} \neq \text{NULL} \)
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

**Input**

See [cusparseStatus_t](#) for the description of the return status

### 13.18. cusparseXcsrsort()

```
cusparseStatus_t
cusparseXcsrsort_bufferSizeExt(cusparseHandle_t handle,
   int m,
   int n,
   int nnz,
   const int* csrRowPtr,
   const int* csrColInd,
```

```
This function sorts CSR format. The stable sorting is in-place.

The matrix type is regarded as CUSPARSE_MATRIX_TYPE_GENERAL implicitly. In other words, any symmetric property is ignored.

This function `csrsort()` requires buffer size returned by `csrsort_bufferSizeExt()`. The address of `pBuffer` must be multiple of 128 bytes. If not, CUSPARSE_STATUS_INVALID_VALUE is returned.

The parameter `P` is both input and output. If the user wants to compute sorted `csrVal`, `P` must be set as `0:1:[nnz-1]` before `csrsort()`, and after `csrsort()`, new sorted value array satisfies `csrVal_sorted = csrVal(P)`.

The general procedure is as follows:

```c
const int m = 3;
const int n = 3;
const int nnz = 9;
csrRowPtr[m+1] = { 0, 3, 6, 9}; // on device
csrColInd[nnz] = { 2, 1, 0, 0, 2,1, 1, 2, 0}; // on device
csrVal[nnz] = { 3, 2, 1, 4, 6, 5, 8, 9, 7}; // on device

// step 1: allocate buffer
cusparseXcsrsort_bufferSizeExt(handle, m, n, nnz, csrRowPtr, csrColInd, &pBufferSizeInBytes);
cudaMalloc( &pBuffer, sizeof(char)* pBufferSizeInBytes);

// step 2: setup permutation vector P to identity
cudaMalloc( (void**)&P, sizeof(int)*nnz);
cusparseCreateIdentityPermutation(handle, nnz, P);

// step 3: sort CSR format
cusparseXcsrsort(handle, m, n, nnz, descrA, csrRowPtr, csrColInd, P, pBuffer);

// step 4: gather sorted csrVal
cusparseDgthr(handle, nnz, csrVal, csrVal_sorted, P, CUSPARSE_INDEX_BASE_ZERO);
```

- The routine requires no extra storage if `pBuffer` != NULL
- The routine does **not** support asynchronous execution
- The routine does **not** support CUDA graph capture

See `cusparseStatus_t` for the description of the return status

### 13.19. `cusparseXcscsort()`

```c

cusparseStatus_t
cusparseXcscsort_bufferSizeExt(cusparseHandle_t handle,
                               int m,
                               int n,
                               int nnz,
                               const int* cscColPtr,
                               const int* cscRowInd,
                               size_t* pBufferSizeInBytes)
```

```c

cusparseStatus_t
cusparseXcscsort(cusparseHandle_t         handle,
                 int                      m,
                 int                      n,
                 int                      nnz,
                 const cusparseMatDescr_t descrA,
                 const int*              cscColPtr,
                 const int*              cscRowInd,
                 int*                     P,
                 void*                    pBuffer)
```

This function sorts CSC format. The stable sorting is in-place.

The matrix type is regarded as `CUSPARSE_MATRIX_TYPE_GENERAL` implicitly. In other words, any symmetric property is ignored.
This function `cscsort()` requires buffer size returned by `cscsort_bufferSizeExt()`. The address of `pBuffer` must be multiple of 128 bytes. If not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

The parameter `P` is both input and output. If the user wants to compute sorted `cscVal`, `P` must be set as `0:1:[nnz-1]` before `cscsort()`, and after `cscsort()`, new sorted value array satisfies `cscVal_sorted = cscVal(P)`.

The general procedure is as follows:

```c
// A is a 3x3 sparse matrix, base-0
//     | 1 2 |
// A = | 4 0 |
//     | 0 8 |
const int m = 3;
const int n = 2;
const int nnz = 4;
cscColPtr[n+1] = { 0, 2, 4}; // on device
cscRowInd[nnz] = { 1, 0, 2, 0}; // on device
cscVal[nnz]    = { 4.0, 1.0, 8.0, 2.0 }; // on device
size_t pBufferSizeInBytes = 0;
void *pBuffer = NULL;
int *P = NULL;

// step 1: allocate buffer
cusparseXcscsort_bufferSizeExt(handle, m, n, nnz, cscColPtr, cscRowInd, &pBufferSizeInBytes);
cudamalloc( &pBuffer, sizeof(char)* pBufferSizeInBytes);

// step 2: setup permutation vector P to identity
cudamalloc( (void**)&P, sizeof(int)*nnz);
cusparseCreateIdentityPermutation(handle, nnz, P);

// step 3: sort CSC format
cusparseXcscsort(handle, m, n, nnz, descrA, cscColPtr, cscRowInd, P, pBuffer);

// step 4: gather sorted cscVal
cusparseDgthr(handle, nnz, cscVal, cscVal_sorted, P, CUSPARSE_INDEX_BASE_ZERO);
```

- The routine requires no extra storage if `pBuffer != NULL`
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

This function transfers unsorted CSR format to CSR format, and vice versa. The operation is in-place.

This function is a wrapper of `csrsort` and `gthr`. The usecase is the following scenario.

If the user has a matrix $A$ of CSR format which is unsorted, and implements his own code (which can be CPU or GPU kernel) based on this special order {for example, diagonal first, then lower triangle, then upper triangle}, and wants to convert it to CSR format when calling CUSPARSE library, and then convert it back when doing something else on his/her kernel. For example, suppose the user wants to solve a linear system $Ax = b$ by the following iterative scheme

$$x^{(k+1)} = x^{(k)} + L^{(-1)*}(b - Ax^{(k)})$$
The code heavily uses SpMV and triangular solve. Assume that the user has an in-house design of SpMV (Sparse Matrix-Vector multiplication) based on special order of $A$. However the user wants to use CUSAPRSE library for triangular solver. Then the following code can work.

```
    do
        step 1: compute residual vector $r = b - A x^{(k)}$
        step 2: $B := \text{sort}(A)$, and $L$ is lower triangular part of $B$
        (only sort $A$ once and keep the permutation vector)
        step 3: solve $z = L^{-1} \cdot (b)
        step 4: add correction $x^{(k+1)} = x^{(k)} + z$
        step 5: $A := \text{unsort}(B)$
        (use permutation vector to get back the unsorted CSR)
    until convergence
```

The requirements of step 2 and step 5 are

1. In-place operation.
2. The permutation vector $P$ is hidden in an opaque structure.
3. No $\text{cudaMalloc}$ inside the conversion routine. Instead, the user has to provide the buffer explicitly.
4. The conversion between unsorted CSR and sorted CSR may needs several times, but the function only generates the permutation vector $P$ once.
5. The function is based on $\text{csrsort}$, $\text{gather}$ and $\text{scatter}$ operations.

The operation is called $\text{csru2csr}$, which means unsorted CSR to sorted CSR. Also we provide the inverse operation, called $\text{csr2csru}$.

In order to keep the permutation vector invisible, we need an opaque structure called $\text{csru2csrInfo}$. Then two functions ($\text{cusparseCreateCsru2csrInfo}$, $\text{cusparseDestroyCsru2csrInfo}$) are used to initialize and to destroy the opaque structure.

$\text{cusparse[S|D|C|Z]csru2csr_bufferSizeExt}$ returns the size of the buffer. The permutation vector $P$ is also allocated inside $\text{csru2csrInfo}$. The lifetime of the permutation vector is the same as the lifetime of $\text{csru2csrInfo}$.

$\text{cusparse[S|D|C|Z]csru2csr}$ performs forward transformation from unsorted CSR to sorted CSR. First call uses $\text{csrsort}$ to generate the permutation vector $P$, and subsequent call uses $P$ to do transformation.

$\text{cusparse[S|D|C|Z]csr2csru}$ performs backward transformation from sorted CSR to unsorted CSR. $P$ is used to get unsorted form back.

The routine $\text{cusparse<t>csru2csr()}$ has the following properties:

- The routine requires no extra storage if $\text{pBuffer} != \text{NULL}$
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

The routine $\text{cusparse<t>csr2csru()}$ has the following properties if $\text{pBuffer} != \text{NULL}$:
The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

The following tables describe parameters of \texttt{csr2csru\_bufferSizeExt} and \texttt{csr2csru}.

```
This function prunes a dense matrix to a sparse matrix with CSR format.

Given a dense matrix $\mathbf{A}$ and a non-negative value $\text{threshold}$, the function returns a sparse matrix $\mathbf{C}$, defined by

$$C(i,j) = A(i,j) \quad \text{if} \quad |A(i,j)| > \text{threshold}$$

The implementation adopts a two-step approach to do the conversion. First, the user allocates $\text{csrRowPtrC}$ of $m+1$ elements and uses function pruneDense2csrNnz() to determine the number of nonzeros columns per row. Second, the user gathers $\text{nnzC}$ [number of nonzeros of matrix C] from either ($\text{nnzC} = \ast \text{nnzTotalDevHostPtr}$) or ($\text{nnzC} = \text{csrRowPtrC}[m]$ -
csrRowPtrC[0]) and allocates csrValC of nnzC elements and csrColIndC of nnzC integers. Finally function pruneDense2csr() is called to complete the conversion.

The user must obtain the size of the buffer required by pruneDense2csr() by calling pruneDense2csr_bufferSizeExt(), allocate the buffer, and pass the buffer pointer to pruneDense2csr().

Appendix section provides a simple example of pruneDense2csr().

The routine cusparse<t>pruneDense2csrNnz() has the following properties:

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

The routine cusparse<t>DpruneDense2csr() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

<td>Prunes a CSR matrix to CSR format, with a specified threshold.</td>
</tr>
</tbody>
</table>
This function prunes a sparse matrix to a sparse matrix with CSR format.

Given a sparse matrix $A$ and a non-negative value $\text{threshold}$, the function returns a sparse matrix $C$, defined by

$$ C(i,j) = A(i,j) \text{ if } |A(i,j)| > \text{threshold} $$

The implementation adopts a two-step approach to do the conversion. First, the user allocates $\text{csrRowPtrC}$ of $m+1$ elements and uses function $\text{pruneCsr2csrNnz()}$ to determine the number of nonzeros columns per row. Second, the user gathers $\text{nnzC}$ (number of nonzeros of matrix $C$) from either $(\text{nnzC}=\text{nnzTotalDevHostPtr})$ or $(\text{nnzC}=\text{csrRowPtrC}[m]-\text{csrRowPtrC}[0])$ and allocates $\text{csrValC}$ of $\text{nnzC}$ elements and $\text{csrColIndC}$ of $\text{nnzC}$ integers. Finally function $\text{pruneCsr2csr()}$ is called to complete the conversion.

The user must obtain the size of the buffer required by $\text{pruneCsr2csr()}$ by calling $\text{pruneCsr2csr_bufferSizeExt()}$, allocate the buffer, and pass the buffer pointer to $\text{pruneCsr2csr()}$.

Appendix section provides a simple example of $\text{pruneCsr2csr()}$.

The routine $\text{cusparse<<t>>pruneCsr2csrNnz()}$ has the following properties:

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture
The routine `cusparse<t>pruneCsr2csr()` has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

This function prunes a dense matrix to a sparse matrix by percentage.

Given a dense matrix $A$ and a non-negative value $\text{percentage}$, the function computes sparse matrix $C$ by the following three steps:

Step 1: sort absolute value of $A$ in ascending order.

\[
\text{key := sort}( |A| )
\]

Step 2: choose threshold by the parameter $\text{percentage}$
Step 3: call pruneDense2csr() by with the parameter threshold.

The implementation adopts a two-step approach to do the conversion. First, the user allocates `csrRowPtrC` of `m+1` elements and uses function `pruneDense2csrNnzByPercentage()` to determine the number of nonzeros columns per row. Second, the user gathers `nnzC` [number of nonzeros of matrix `C`] from either `nnzC=*nnzTotalDevHostPtr` or `nnzC=csrRowPtrC[m]-csrRowPtrC[0]` and allocates `csrValC` of `nnzC` elements and `csrColIndC` of `nnzC` integers. Finally function `pruneDense2csrByPercentage()` is called to complete the conversion.

The user must obtain the size of the buffer required by `pruneDense2csrByPercentage()` by calling `pruneDense2csrByPercentage_bufferSizeExt()`, allocate the buffer, and pass the buffer pointer to `pruneDense2csrByPercentage()`.

Remark 1: the value of `percentage` must be not greater than 100. Otherwise, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Remark 2: the zeros of `A` are not ignored. All entries are sorted, including zeros. This is different from `pruneCsr2csrByPercentage()`.

Appendix section provides a simple example of `pruneDense2csrNnzByPercentage()`.

The routine `cusparse<t>pruneDense2csrNnzByPercentage()` has the following properties:

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

The routine `cusparse<t>pruneDense2csrByPercentage()` has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

This function prunes a sparse matrix to a sparse matrix by percentage.

Given a sparse matrix $A$ and a non-negative value $\text{percentage}$, the function computes sparse matrix $C$ by the following three steps:

Step 1: sort absolute value of $A$ in ascending order.

$$\textbf{key} := \text{sort}(|\text{csrValA}|)$$

Step 2: choose threshold by the parameter $\text{percentage}$

$$\text{pos} = \text{ceil}(\text{nnzA} \times (\text{percentage}/100)) - 1$$
$$\text{pos} = \min(\text{pos}, \text{nnzA} - 1)$$
$$\text{pos} = \max(\text{pos}, 0)$$
$$\text{threshold} = \text{key}[\text{pos}]$$

Step 3: call pruneCsr2csr() by with the parameter threshold.

The implementation adopts a two-step approach to do the conversion. First, the user allocates $\text{csrRowPtrC}$ of $m+1$ elements and uses function pruneCsr2csrNnzByPercentage() to determine the number of nonzeros columns per row. Second, the user gathers
nnzC [number of nonzeros of matrix C] from either (nnzC=nnzTotalDevHostPtr) or (nnzC=csrRowPtrC[m]-csrRowPtrC[0]) and allocates csrValC of nnzC elements and csrColIndC of nnzC integers. Finally function pruneCsr2csrByPercentage() is called to complete the conversion.

The user must obtain the size of the buffer required by pruneCsr2csrByPercentage() by calling pruneCsr2csrByPercentage_bufferSizeExt(), allocate the buffer, and pass the buffer pointer to pruneCsr2csrByPercentage().

Remark 1: the value of percentage must be not greater than 100. Otherwise, CUSPARSE_STATUS_INVALID_VALUE is returned.

Appendix section provides a simple example of pruneCsr2csrByPercentage().

The routine cusparse<t>pruneCsr2csrNnzByPercentage() has the following properties:

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

The routine cusparse<t>pruneCsr2csrByPercentage() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports CUDA graph capture

See `cusparseStatus_t` for the description of the return status

13.25. `cusparse<t>nnz_compress()`

```c
 cusparseStatus_t
 cusparseSnnz_compress(cusparseHandle_t handle, int m, const cusparseMatDescr_t descr, const float* csrValA, const int* csrRowPtrA, int* nnzPerRow, int* nnzC, float tol)

cusparseStatus_t
 cusparseDnnz_compress(cusparseHandle_t handle, int m, const cusparseMatDescr_t descr, const double* csrValA, const int* csrRowPtrA, int* nnzPerRow, int* nnzC, double tol)

cusparseStatus_t
 cusparseCnnz_compress(cusparseHandle_t handle, int m, const cusparseMatDescr_t descr, const cuComplex* csrValA, const int* csrRowPtrA, int* nnzPerRow, int* nnzC, cuComplex tol)

cusparseStatus_t
 cusparseZnnz_compress(cusparseHandle_t handle, int m, const cusparseMatDescr_t descr, const cuDoubleComplex* csrValA, const int* csrRowPtrA, int* nnzPerRow, int* nnzC, cuDoubleComplex tol)
```
This function is the step one to convert from csr format to compressed csr format.

Given a sparse matrix $A$ and a non-negative value threshold, the function returns $\text{nnzPerRow}(the\ number\ of\ nonzeros\ columns\ per\ row)$ and $\text{nnzC}(the\ total\ number\ of\ nonzeros)$ of a sparse matrix $C$, defined by

$$C(i,j) = A(i,j) \text{ if } |A(i,j)| > \text{threshold}$$

A key assumption for the cuComplex and cuDoubleComplex case is that this tolerance is given as the real part. For example $\text{tol} = 1e-8 + 0*i$ and we extract $cureal$, that is the $x$ component of this struct.

- This function requires temporary extra storage that is allocated internally
- The routine does not support asynchronous execution
- The routine does not support CUDA graph capture

**Input**

<table>
<thead>
<tr>
<th>handle</th>
<th>handle to the cuSPARSE library context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>$m$</td>
<td>number of rows of matrix $A$.</td>
</tr>
<tr>

<td>csrValA</td>
<td>csr noncompressed values array</td>
</tr>
<tr>
<td>csrRowPtrA</td>
<td>the corresponding input noncompressed row pointer.</td>
</tr>
<tr>
<td>tol</td>
<td>non-negative tolerance to determine if a number less than or equal to it.</td>
</tr>
</tbody>
</table>

**Output**

| nnzPerRow | this array contains the number of elements whose absolute values are greater than tol per row. |
| nnzC      | host/device pointer of the total number of elements whose absolute values are greater than tol. |

See [cusparseStatus_t](#) for the description of the return status.
Chapter 14. cuSPARSE Generic API Reference

The cuSPARSE Generic APIs allow computing the most common sparse linear algebra operations, such as sparse matrix-vector (SpMV) and sparse matrix-matrix multiplication (SpMM), in a flexible way. The new APIs have the following capabilities and features:

- Set matrix data layouts, number of batches, and storage formats (for example, CSR, COO, and so on)
- Set input/output/compute data types. This also allows mixed data-type computation
- Set types of sparse matrix indices
- Choose the algorithm for the computation
- Provide external device memory for internal operations
- Provide extensive consistency checks across input matrices and vectors for a given routine. This includes the validation of matrix sizes, data types, layout, allowed operations, etc.

14.1. Generic Types Reference

The cuSPARSE generic type references are described in this section.

14.1.1. cudaMemcpy_t

The section describes the types shared by multiple CUDA Libraries and defined in the header file `library_types.h`. The cudaMemcpy type is an enumerator to specify the data precision. It is used when the data reference does not carry the type itself (e.g. `void*`). For example, it is used in the routine `cusparseSpMM()`.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
<th>Data Type</th>
<th>Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td>The data type is 16-bit IEEE-754 floating-point</td>
<td>__half</td>
<td>cuda_fp16.h</td>
</tr>
<tr>
<td>CUDA_C_16F</td>
<td>The data type is 16-bit complex IEEE-754 floating-point</td>
<td>__half2</td>
<td>cuda_fp16.h</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
<td>The data type is 16-bit bfloat floating-point</td>
<td>__nv_bfloat16</td>
<td>cuda_bf16.h</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
<td>The data type is 16-bit complex bfloat floating-point</td>
<td>__nv_bfloat162</td>
<td>cuda_bf16.h</td>
</tr>
<tr>
<td>Value</td>
<td>Meaning</td>
<td>Data Type</td>
<td>Header</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------</td>
<td>----------------</td>
<td>------------</td>
</tr>
<tr>
<td>CUDA_R_32F</td>
<td>The data type is 32-bit IEEE-754 floating-point</td>
<td>float</td>
<td></td>
</tr>
<tr>
<td>CUDA_C_32F</td>
<td>The data type is 32-bit complex IEEE-754</td>
<td>cuComplex</td>
<td>cuComplex.h</td>
</tr>
<tr>
<td>CUDA_R_64F</td>
<td>The data type is 64-bit IEEE-754 floating-point</td>
<td>double</td>
<td></td>
</tr>
<tr>
<td>CUDA_C_64F</td>
<td>The data type is 64-bit complex IEEE-754</td>
<td>cuDoubleComplex</td>
<td>cuComplex.h</td>
</tr>
<tr>
<td>CUDA_R_8I</td>
<td>The data type is 8-bit integer</td>
<td>int8_t</td>
<td>stdint.h</td>
</tr>
<tr>
<td>CUDA_R_32I</td>
<td>The data type is 32-bit integer</td>
<td>int32_t</td>
<td>stdint.h</td>
</tr>
</tbody>
</table>

**IMPORTANT:** The Generic API routines allow all data types reported in the respective section of the documentation only on GPU architectures with *native* support for them. If a specific GPU model does not provide *native* support for a given data type, the routine returns CUSPARSE_STATUS_ARCH_MISMATCH error.

Unsupported data types and Compute Capability (CC):

- __half on GPUs with CC < 53 (e.g. Kepler)
- __nv_bfloat16 on GPUs with CC < 80 (e.g. Kepler, Maxwell, Pascal, Volta, Turing)

### 14.1.2. cusparseFormat_t
This type indicates the format of the sparse matrix.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_FORMAT_COO</td>
<td>The matrix is stored in Coordinate (COO) format organized in Structure of Arrays (SoA) layout</td>
</tr>
<tr>
<td>CUSPARSE_FORMAT_COO_AOS</td>
<td>The matrix is stored in Coordinate (COO) format organized in Array of Structures (SoA) layout</td>
</tr>
<tr>
<td>CUSPARSE_FORMAT_CSR</td>
<td>The matrix is stored in Compressed Sparse Row (CSR) format</td>
</tr>
<tr>
<td>CUSPARSE_FORMAT_CSC</td>
<td>The matrix is stored in Compressed Sparse Column (CSC) format</td>
</tr>
<tr>
<td>CUSPARSE_FORMAT_BLOCKED_ELL</td>
<td>The matrix is stored in Blocked-Ellpack (Blocked-ELL) format</td>
</tr>
</tbody>
</table>

### 14.1.3. cusparseOrder_t
This type indicates the memory layout of a dense matrix.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_ORDER_ROW</td>
<td>The matrix is stored in row-major</td>
</tr>
<tr>
<td>CUSPARSE_ORDER_COL</td>
<td>The matrix is stored in column-major</td>
</tr>
</tbody>
</table>
14.1.4. **cusparseIndexType_t**

This type indicates the index type for representing the sparse matrix indices.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_INDEX_16U</td>
<td>16-bit unsigned integer [1, 65535]</td>
</tr>
<tr>
<td>CUSPARSE_INDEX_32I</td>
<td>32-bit signed integer [1, 2^{31} - 1]</td>
</tr>
<tr>
<td>CUSPARSE_INDEX_64I</td>
<td>64-bit signed integer [1, 2^{63} - 1]</td>
</tr>
</tbody>
</table>

14.2. **Sparse Vector APIs**

The cuSPARSE helper functions for sparse vector descriptor are described in this section.

14.2.1. **cusparseCreateSpVec()**

```c
 cusparseStatus_t cusparseCreateSpVec(cusparseSpVecDescr_t* spVecDescr, int64_t size, int64_t nnz, void* indices, void* values, cusparseIndexType_t idxType, cusparseIndexBase_t idxBase, cudaDataType valueType)
```

This function initializes the sparse matrix descriptor `spVecDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spVecDescr</td>
<td>HOST</td>
<td>OUT</td>
<td>Sparse vector descriptor</td>
</tr>
<tr>
<td>size</td>
<td>HOST</td>
<td>IN</td>
<td>Size of the sparse vector</td>
</tr>
<tr>
<td>nnz</td>
<td>HOST</td>
<td>IN</td>
<td>Number of non-zero entries of the sparse vector</td>
</tr>
<tr>
<td>indices</td>
<td>HOST</td>
<td>IN</td>
<td>Indices of the sparse vector. Array of size <code>nnz</code></td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse vector. Array of size <code>nnz</code></td>
</tr>
<tr>
<td>idxType</td>
<td>HOST</td>
<td>IN</td>
<td>Enumerator specifying the data type of <code>indices</code></td>
</tr>
<tr>
<td>idxBase</td>
<td>HOST</td>
<td>IN</td>
<td>Enumerator specifying the the base index of <code>indices</code></td>
</tr>
<tr>
<td>valueType</td>
<td>HOST</td>
<td>IN</td>
<td>Enumerator specifying the datatype of <code>values</code></td>
</tr>
</tbody>
</table>

**NOTE:** it is safe to cast away constness (`const_cast`) for input pointers if the descriptor will not be used as an output parameter of a routine (e.g. conversion functions).

See `cusparseStatus_t` for the description of the return status.

14.2.2. **cusparseDestroySpVec()**

```c
 cusparseStatus_t cusparseDestroySpVec(cusparseSpVecDescr_t spVecDescr)
```
This function releases the host memory allocated for the sparse vector descriptor `spVecDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector descriptor</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

### 14.2.3. `cusparseSpVecGet()`

```c
cusparseStatus_t
cusparseSpVecGet(cusparseSpVecDescr_t spVecDescr,
                 int64_t*             size,
                 int64_t*             nnz,
                 void**              indices,
                 void**              values,
                 cusparseIndexType_t* idxType,
                 cusparseIndexBase_t* idxBase,
                 cudaDataType*        valueType)
```

This function returns the fields of the sparse vector descriptor `spVecDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector descriptor</td>
</tr>
<tr>

<td>HOST</td>
<td>OUT</td>
<td>Enumerator specifying the datatype of <code>values</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

### 14.2.4. `cusparseSpVecGetIndexBase()`

```c
cusparseStatus_t
cusparseSpVecGetIndexBase(cusparseSpVecDescr_t spVecDescr,
                          cusparseIndexBase_t* idxBase)
```

This function returns the `idxBase` field of the sparse vector descriptor `spVecDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector descriptor</td>
</tr>
<tr>
<td>idxBase</td>
<td>HOST</td>
<td>OUT</td>
<td>Enumerator specifying the base index of <code>indices</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status
14.2.5. cusparseSpVecGetValues()

cusparseStatus_t
cusparseSpVecGetValues(cusparseSpVecDescr_t spVecDescr, 
void** values)

This function returns the values field of the sparse vector descriptor spVecDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector descriptor</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the sparse vector. Array of size nnz</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status.

14.2.6. cusparseSpVecSetValues()

cusparseStatus_t
cusparseSpVecSetValues(cusparseSpVecDescr_t spVecDescr, 
void* values)

This function sets the values field of the sparse vector descriptor spVecDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector descriptor</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse vector. Array of size nnz</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status.

14.3. Sparse Matrix APIs

The cuSPARSE helper functions for sparse matrix descriptor are described in this section.

14.3.1. cusparseCreateCoo()

cusparseStatus_t
cusparseCreateCoo(cusparseSpMatDescr_t* spMatDescr, 
int64_t rows, 
int64_t cols, 
int64_t nnz, 
void* cooRowInd, 
void* cooColInd, 
void* cooValues, 
cusparseIndexType_t cooIdxType, 
cusparseIndexBase_t idxBase, 
cudaDataType valueType)

This function initializes the sparse matrix descriptor spMatDescr in the COO format (Structure of Arrays layout).
### 14.3.2. cusparseCreateCooAoS() [DEPRECATED]

This function initializes the sparse matrix descriptor `spMatDescr` in the COO format (Array of Structures layout).

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>OUT</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>rows</td>
<td>HOST</td>
<td>IN</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td>cols</td>
<td>HOST</td>
<td>IN</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td>nnz</td>
<td>HOST</td>
<td>IN</td>
<td>Number of non-zero entries of the sparse matrix</td>
</tr>
<tr>
<td>cooInd</td>
<td>DEVICE</td>
<td>IN</td>
<td>⟨Row, Column⟩ indices of the sparse matrix. Array of size (nnz)</td>
</tr>
<tr>
<td>cooValues</td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size (nnz)</td>
</tr>
<tr>
<td>cooIdxType</td>
<td>HOST</td>
<td>IN</td>
<td>Data type of <code>cooInd</code></td>
</tr>
<tr>
<td>idxBase</td>
<td>HOST</td>
<td>IN</td>
<td>Base index of <code>cooInd</code></td>
</tr>
<tr>
<td>valueType</td>
<td>HOST</td>
<td>IN</td>
<td>Datatype of <code>cooValues</code></td>
</tr>
</tbody>
</table>
14.3.3. **cusparseCreateCsr()**

This function initializes the sparse matrix descriptor `spMatDescr` in the CSR format.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td><code>nnz</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of non-zero entries of the sparse matrix</td>
</tr>
<tr>
<td><code>csrRowOffsets</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Row offsets of the sparse matrix. Array of size <code>rows + 1</code></td>
</tr>
<tr>
<td><code>csrColInd</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Column indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>csrValues</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>csrRowOffsetsType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Data type of <code>csrRowOffsets</code></td>
</tr>
<tr>
<td><code>csrColIndType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Data type of <code>csrColInd</code></td>
</tr>
<tr>
<td><code>idxBase</code></td>
<td>HOST</td>
<td>IN</td>
<td>Base index of <code>csrRowOffsets</code> and <code>csrColInd</code></td>
</tr>
<tr>
<td><code>valueType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Datatype of <code>csrValues</code></td>
</tr>
</tbody>
</table>

**NOTE:** it is safe to cast away constness ([`const_cast`]) for input pointers if the descriptor will not be used as an output parameter of a routine (e.g. conversion functions).

See **cusparseStatus_t** for the description of the return status

14.3.4. **cusparseCreateCsc()**

cusparseStatus_t
cusparseCreateCsc(cusparseSpMatDescr_t* spMatDescr, 
                int64_t rows, 
                int64_t cols, 
                int64_t nnz, 
                void** csrColOffsets, 
                void* csrRowInd, 
                void* csrValues, 
                cusparseIndexType_t csrColOffsetsType, 
                cusparseIndexType_t csrRowIndType, 
                cusparseIndexBase_t idxBase, 
                cudaDataType valueType)

This function initializes the sparse matrix descriptor `spMatDescr` in the CSC format.
This function initializes the sparse matrix descriptor `spMatDescr` in the CSC format.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td><code>nnz</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of non-zero entries of the sparse matrix</td>
</tr>
<tr>
<td><code>cscColOffsets</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Column offsets of the sparse matrix. Array of size <code>cols + 1</code></td>
</tr>
<tr>
<td><code>cscRowInd</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Row indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cscValues</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cscColOffsetsType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Data type of <code>cscColOffsets</code></td>
</tr>
<tr>
<td><code>cscRowIndType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Data type of <code>cscRowInd</code></td>
</tr>
<tr>
<td><code>idxBase</code></td>
<td>HOST</td>
<td>IN</td>
<td>Base index of <code>cscColOffsets</code> and <code>cscRowInd</code></td>
</tr>
<tr>
<td><code>valueType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Datatype of <code>cscValues</code></td>
</tr>
</tbody>
</table>

**NOTE:** it is safe to cast away constness (`const_cast`) for input pointers if the descriptor will not be used as an output parameter of a routine (e.g. conversion functions).

See `cusparseStatus_t` for the description of the return status.

### 14.3.5. `cusparseCreateBlockedEll()`

This function initializes the sparse matrix descriptor `spMatDescr` for the Blocked-Ellpack (ELL) format.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td><code>ellBlockSize</code></td>
<td>HOST</td>
<td>IN</td>
<td>Size of the ELL-Block</td>
</tr>
<tr>
<td><code>ellColInd</code></td>
<td>HOST</td>
<td>IN</td>
<td></td>
</tr>
<tr>
<td><code>ellValue</code></td>
<td>HOST</td>
<td>IN</td>
<td></td>
</tr>
</tbody>
</table>

- `spMatDescr` (HOST OUT) - Sparse matrix descriptor
- `rows` (HOST IN) - Number of rows of the sparse matrix
- `cols` (HOST IN) - Number of columns of the sparse matrix
- `ellBlockSize` (HOST IN) - Size of the ELL-Block
<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ellCols</td>
<td>HOST</td>
<td>IN</td>
<td>Actual number of columns of the Blocked-Ellpack format (ellValue columns)</td>
</tr>
<tr>
<td>ellColInd</td>
<td>DEVICE</td>
<td>IN</td>
<td>Blocked-ELL Column indices. Array of size [ellCols / ellBlockSize][rows / ellBlockSize]</td>
</tr>
<tr>
<td>ellValue</td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size rows * ellCols</td>
</tr>
<tr>
<td>ellIdxType</td>
<td>HOST</td>
<td>IN</td>
<td>Data type of ellColInd</td>
</tr>
<tr>
<td>idxBase</td>
<td>HOST</td>
<td>IN</td>
<td>Base index of ellColInd</td>
</tr>
<tr>
<td>valueType</td>
<td>HOST</td>
<td>IN</td>
<td>Datatype of ellValue</td>
</tr>
</tbody>
</table>

Blocked-ELL Column indices (ellColInd) are in the range [0, cols / ellBlockSize -1]. The array can contain −1 values for indicating empty blocks.

**NOTE:** it is safe to cast away constness (const_cast) for input pointers if the descriptor will not be used as an output parameter of a routine (e.g. conversion functions).

### Figure 1. Blocked-ELL representation

See **cusparseStatus_t** for the description of the return status

#### 14.3.6. `cusparseDestroySpMat()`

```c

cusparseStatus_t
cusparseDestroySpMat(cusparseSpMatDescr_t spMatDescr)
```

This function releases the host memory allocated for the sparse matrix descriptor spMatDescr.
14.3.7. cusparseCooGet()

This function returns the fields of the sparse matrix descriptor `spMatDescr` stored in COO format [Array of Structures layout].

**Param.** | **Memory** | **In/out** | **Meaning**
--- | --- | --- | ---
`spMatDescr` | HOST | IN | Sparse matrix descriptor
`rows` | HOST | OUT | Number of rows of the sparse matrix
`cols` | HOST | OUT | Number of columns of the sparse matrix
`nnz` | HOST | OUT | Number of non-zero entries of the sparse matrix
`cooRowInd` | DEVICE | OUT | Row indices of the sparse matrix. Array of size `nnz`
`cooColInd` | DEVICE | OUT | Column indices of the sparse matrix. Array of size `nnz`
`cooValues` | DEVICE | OUT | Values of the sparse matrix. Array of size `nnz`
`cooIdxType` | HOST | OUT | Data type of `cooRowInd` and `cooColInd`
`idxBase` | HOST | OUT | Base index of `cooRowInd` and `cooColInd`
`valueType` | HOST | OUT | Datatype of `cooValues`

See `cusparseStatus_t` for the description of the return status

14.3.8. cusparseCooAosGet() [DEPRECATED]

cusparseStatus_t

cusparseCooAosGet(cusparseSpMatDescr_t spMatDescr,
    int64_t* rows,
    int64_t* cols,
    int64_t* nnz,
    void** cooRowInd,
    void** cooColInd,
    void** cooValues,
    cusparseIndexType_t* idxType,
    cusparseIndexBase_t* idxBase,
    cudaMemcpyType_t* cudaMemcpy,
    cudaDataType* valueType)

This function is deprecated.
This function returns the fields of the sparse matrix descriptor `spMatDescr` stored in COO format (Structure of Arrays layout).

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td><code>nnz</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of non-zero entries of the sparse matrix</td>
</tr>
<tr>
<td><code>cooInd</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>&lt;Row, Column&gt; indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cooValues</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cooIdxType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Data type of <code>cooInd</code></td>
</tr>
<tr>
<td><code>idxBase</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Base index of <code>cooInd</code></td>
</tr>
<tr>
<td><code>valueType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Datatype of <code>cooValues</code></td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status.

### 14.3.9. cusparseCsrGet()

```c
cusparseStatus_t
cusparseCsrGet(cusparseSpMatDescr_t spMatDescr,
               int64_t*             rows,
               int64_t*             cols,
               int64_t*             nnz,
               void**               csrRowOffsets,
               void**               csrColInd,
               void**               csrValues,
               cusparseIndexType_t* csrRowOffsetsType,
               cusparseIndexType_t* csrColIndType,
               cusparseIndexBase_t* idxBase,
               cudaDataType*        valueType)
```

This function returns the fields of the sparse matrix descriptor `spMatDescr` stored in CSR format.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td><code>nnz</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of non-zero entries of the sparse matrix</td>
</tr>
<tr>
<td><code>csrRowOffsets</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Row offsets of the sparse matrix. Array of size <code>rows + 1</code></td>
</tr>
<tr>
<td><code>csrColInd</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Column indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>csrValues</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>csrRowOffsetsType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Data type of <code>csrRowOffsets</code></td>
</tr>
<tr>
<td><code>csrColIndType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Data type of <code>csrColInd</code></td>
</tr>
</tbody>
</table>
### 14.3.10. cusparseCsrSetPointers()

```c
 cusparseStatus_t
 cusparseCsrSetPointers(cusparseSpMatDescr_t spMatDescr,
                      void*                csrRowOffsets,
                      void*                csrColInd,
                      void*                csrValues)
```

This function sets the pointers of the sparse matrix descriptor `spMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>csrRowOffsets</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Row offsets of the sparse matrix. Array of size <code>rows + 1</code></td>
</tr>
<tr>
<td><code>csrColInd</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Column indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>csrValues</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status.

### 14.3.11. cusparseCscSetPointers()

```c
 cusparseStatus_t
 cusparseCscSetPointers(cusparseSpMatDescr_t spMatDescr,
                      void*                cscColOffsets,
                      void*                cscRowInd,
                      void*                cscValues)
```

This function sets the pointers of the sparse matrix descriptor `spMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>cscColOffsets</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Col offsets of the sparse matrix. Array of size <code>cols + 1</code></td>
</tr>
<tr>
<td><code>cscRowInd</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Row indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cscValues</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status.

### 14.3.12. cusparseCooSetPointers()

cusparseStatus_t

```c
void* cooRows,
void* cooColumns,
void* cooValues)
```

This function sets the pointers of the sparse matrix descriptor `spMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>cooRows</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Row indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cooColumns</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Column indices of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
<tr>
<td><code>cooValues</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size <code>nnz</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status

### 14.3.13. cusparseBlockedEllGet()

```c
int64_t* rows,
int64_t* cols,
int64_t* ellBlockSize,
int64_t* ellCols,
void** ellColInd,
void** ellValue,
cusparseIndexType_t* ellIdxType,
cusparseIndexBase_t* idxBase,
cudaDataType* valueType
```

This function returns the fields of the sparse matrix descriptor `spMatDescr` stored in Blocked-Ellpack (ELL) format.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td><code>ellBlockSize</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Size of the ELL-Block</td>
</tr>
<tr>
<td><code>ellCols</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Actual number of columns of the Blocked-Ellpack format</td>
</tr>
<tr>
<td><code>ellColInd</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Column indices for the ELL-Block. Array of size <code>[cols / ellBlockSize][rows / ellBlockSize]</code></td>
</tr>
<tr>
<td><code>ellValue</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the sparse matrix. Array of size <code>rows * ellCols</code></td>
</tr>
<tr>
<td><code>ellIdxType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Data type of <code>ellColInd</code></td>
</tr>
<tr>
<td><code>idxBase</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Base index of <code>ellColInd</code></td>
</tr>
<tr>
<td><code>valueType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Datatype of <code>ellValue</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status
14.3.14. cusparseSpMatGetSize()

```c
cusparseStatus_t
cusparseSpMatGetSize(cusparseSpMatDescr_t spMatDescr,
int64_t*             rows,
int64_t*             cols,
int64_t*             nnz)
```

This function returns the sizes of the sparse matrix `spMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>rows</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of rows of the sparse matrix</td>
</tr>
<tr>
<td>cols</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of columns of the sparse matrix</td>
</tr>
<tr>
<td>nnz</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of non-zero entries of the sparse matrix</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status.

14.3.15. cusparseSpMatGetFormat()

```c
cusparseStatus_t
cusparseSpMatGetFormat(cusparseSpMatDescr_t spMatDescr,
cusparseFormat_t*    format)
```

This function returns the `format` field of the sparse matrix descriptor `spMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>format</td>
<td>HOST</td>
<td>OUT</td>
<td>Storage format of the sparse matrix</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status.

14.3.16. cusparseSpMatGetIndexBase()

```c
cusparseStatus_t
cusparseSpMatGetIndexBase(cusparseSpMatDescr_t spMatDescr,
cusparseIndexBase_t* idxBase)
```

This function returns the `idxBase` field of the sparse matrix descriptor `spMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>idxBase</td>
<td>HOST</td>
<td>OUT</td>
<td>Base index of the sparse matrix</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status.
14.3.17. cusparseSpMatGetValues()

cusparseStatus_t
cusparseSpMatGetValues(cusparseSpMatDescr_t spMatDescr,
    void**               values)

This function returns the values field of the sparse matrix descriptor spMatDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the sparse matrix. Array of size nnz</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status

14.3.18. cusparseSpMatSetValues()

cusparseStatus_t
cusparseSpMatSetValues(cusparseSpMatDescr_t spMatDescr,
    void*                values)

This function sets the values field of the sparse matrix descriptor spMatDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the sparse matrix. Array of size nnz</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status

14.3.19. cusparseSpMatGetStridedBatch()

cusparseStatus_t
cusparseSpMatGetStridedBatch(cusparseSpMatDescr_t spMatDescr,
    int*                 batchCount)

This function returns the batchCount field of the sparse matrix descriptor spMatDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>batchCount</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of batches of the sparse matrix</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status
14.3.20. cusparseSpMatSetStridedBatch()

[DEPRECATED]

[[DEPRECATED]] use cusparseSpMatSetCsrStridedBatch(), cusparseSpMatSetCooStridedBatch() instead. The routine will be removed in the next major release.

cusparseStatus_t
cusparseSpMatSetStridedBatch(cusparseSpMatDescr_t spMatDescr,
int                  batchCount)

This function sets the batchCount field of the sparse matrix descriptor spMatDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>batchCount</td>
<td>HOST</td>
<td>IN</td>
<td>Number of batches of the sparse matrix</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status.

14.3.21. cusparseCooSetStridedBatch()

cusparseStatus_t
cusparseCooSetStridedBatch(cusparseSpMatDescr_t spMatDescr,
int                  batchCount,
int64_t              batchStride)

This function sets the batchCount and the batchStride fields of the sparse matrix descriptor spMatDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>batchCount</td>
<td>HOST</td>
<td>IN</td>
<td>Number of batches of the sparse matrix</td>
</tr>
<tr>
<td>batchStride</td>
<td>HOST</td>
<td>IN</td>
<td>address offset between consecutive batches</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status.

14.3.22. cusparseCsrSetStridedBatch()

cusparseStatus_t
cusparseCsrSetStridedBatch(cusparseSpMatDescr_t spMatDescr,
int                  batchCount,
int64_t              offsetsBatchStride,
int64_t              columnsValuesBatchStride)

This function sets the batchCount and the batchStride fields of the sparse matrix descriptor spMatDescr.
<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>batchCount</td>
<td>HOST</td>
<td>IN</td>
<td>Number of batches of the sparse matrix</td>
</tr>
<tr>
<td>offsetsBatchStr</td>
<td>HOST</td>
<td>IN</td>
<td>Address offset between consecutive batches for the row offset array</td>
</tr>
<tr>
<td>offsetsBatchStr</td>
<td>HOST</td>
<td>IN</td>
<td>Address offset between consecutive batches for the column and value arrays</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status

### 14.3.23. cusparseSpMatGetAttribute()

```c

cusparseStatus_t
cusparseSpMatGetAttribute(cusparseSpMatDescr_t     spMatDescr,
cusparseSpMatAttribute_t attribute,
void*                    data,
size_t                   dataSize)
```

The function gets the attributes of the sparse matrix descriptor `spMatDescr`

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>spMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix descriptor</td>
</tr>
<tr>
<td>attribute</td>
<td>HOST</td>
<td>IN</td>
<td>Attribute enumerator</td>
</tr>
<tr>
<td>data</td>
<td>HOST</td>
<td>OUT</td>
<td>Attribute value</td>
</tr>
<tr>
<td>dataSize</td>
<td>HOST</td>
<td>IN</td>
<td>Size of the attribute in bytes for safety</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Meaning</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SPMAT_FILL_MODE</td>
<td>Indicates if the lower or upper part of a matrix is stored in sparse storage</td>
<td>CUSPARSE_FILL_MODE_LOWER</td>
</tr>
<tr>
<td></td>
<td></td>
<td>CUSPARSE_FILL_MODE_UPPER</td>
</tr>
<tr>
<td>CUSPARSE_SPMAT_DIAG_TYPE</td>
<td>Indicates if the matrix diagonal entries are unity</td>
<td>CUSPARSE_DIAG_TYPE_NON_UNIT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>CUSPARSE_DIAG_TYPE_UNIT</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status

### 14.3.24. cusparseSpMatSetAttribute()  

```c

cusparseStatus_t
cusparseSpMatSetAttribute(cusparseSpMatDescr_t     spMatDescr,
cusparseSpMatAttribute_t attribute,
const void*              data,
size_t                   dataSize)
```

The function sets the attributes of the sparse matrix descriptor `spMatDescr`
### 14.4. Dense Vector APIs

The cuSPARSE helper functions for dense vector descriptor are described in this section.

#### 14.4.1. cusparseCreateDnVec()

```c
 cusparseStatus_t cusparseCreateDnVec(cusparseDnVecDescr_t* dnVecDescr, 
    int64_t size, 
    void* values, 
    cudaDataType valueType)
```

This function initializes the dense vector descriptor `dnVecDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnVecDescr</td>
<td>HOST</td>
<td>OUT</td>
<td>Dense vector descriptor</td>
</tr>
<tr>
<td>size</td>
<td>HOST</td>
<td>IN</td>
<td>Size of the dense vector</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the dense vector. Array of size <code>size</code></td>
</tr>
<tr>
<td>valueType</td>
<td>HOST</td>
<td>IN</td>
<td>Enumerator specifying the datatype of <code>values</code></td>
</tr>
</tbody>
</table>

**NOTE:** It is safe to cast away constness (`const_cast`) for input pointers if the descriptor will not be used as an output parameter of a routine (e.g., conversion functions).

See `cusparseStatus_t` for the description of the return status.

#### 14.4.2. cusparseDestroyDnVec()

```c
 cusparseStatus_t
```

See `cusparseStatus_t` for the description of the return status.
cusparseDestroyDnVec(cusparseDnVecDescr_t dnVecDescr)

This function releases the host memory allocated for the dense vector descriptor dnVecDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Dense vector descriptor</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status

### 14.4.3. cusparseDnVecGet()

```c

cusparseStatus_t
cusparseDnVecGet(cusparseDnVecDescr_t dnVecDescr,
                int64_t* size,
                void** values,
                cudaDataType* valueType)
```

This function returns the fields of the dense vector descriptor dnVecDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Dense vector descriptor</td>
</tr>
<tr>
<td>size</td>
<td>HOST</td>
<td>OUT</td>
<td>Size of the dense vector</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the dense vector. Array of size nnz</td>
</tr>
<tr>
<td>valueType</td>
<td>HOST</td>
<td>OUT</td>
<td>Enumerator specifying the datatype of values</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status

### 14.4.4. cusparseDnVecGetValues()

```c

cusparseStatus_t
cusparseDnVecGetValues(cusparseDnVecDescr_t dnVecDescr,
                        void** values)
```

This function returns the values field of the dense vector descriptor dnVecDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Dense vector descriptor</td>
</tr>
<tr>
<td>values</td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the dense vector</td>
</tr>
</tbody>
</table>

See cusparseStatus_t for the description of the return status

### 14.4.5. cusparseDnVecSetValues()

```c

cusparseStatus_t
cusparseDnVecSetValues(cusparseDnVecDescr_t dnVecDescr,
                        void* values)
```

This function set the values field of the dense vector descriptor dnVecDescr.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnVecDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Dense vector descriptor</td>
</tr>
</tbody>
</table>
The possible error values returned by this function and their meanings are listed below:

See `cusparseStatus_t` for the description of the return status.

### 14.5. Dense Matrix APIs

The cuSPARSE helper functions for dense matrix descriptor are described in this section.

#### 14.5.1. cusparseCreateDnMat()

```c
 cusparseStatus_t cusparseCreateDnMat(cusparseDnMatDescr_t* dnMatDescr,
                                     int64_t               rows,
                                     int64_t               cols,
                                     int64_t               ld,
                                     void*                 values,
                                     cudaDataType          valueType,
                                     cusparseOrder_t       order)
```

The function initializes the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dnMatDescr</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Dense matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of rows of the dense matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>IN</td>
<td>Number of columns of the dense matrix</td>
</tr>
<tr>
<td><code>ld</code></td>
<td>HOST</td>
<td>IN</td>
<td>Leading dimension of the dense matrix</td>
</tr>
<tr>
<td><code>values</code></td>
<td>DEVICE</td>
<td>IN</td>
<td>Values of the dense matrix. Array of size <code>size</code></td>
</tr>
<tr>
<td><code>valueType</code></td>
<td>HOST</td>
<td>IN</td>
<td>Enumerator specifying the datatype of <code>values</code></td>
</tr>
<tr>
<td><code>order</code></td>
<td>HOST</td>
<td>IN</td>
<td>Enumerator specifying the memory layout of the dense matrix</td>
</tr>
</tbody>
</table>

**NOTE:** it is safe to cast away constness (`const_cast`) for input pointers if the descriptor will not be used as an output parameter of a routine (e.g. conversion functions).

See `cusparseStatus_t` for the description of the return status.

#### 14.5.2. cusparseDestroyDnMat()

```c
 cusparseStatus_t cusparseDestroyDnMat(cusparseDnMatDescr_t dnMatDescr)
```

This function releases the host memory allocated for the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dnMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix descriptor</td>
</tr>
</tbody>
</table>
### 14.5.3. `cusparseDnMatGet()`

```c
cusparseStatus_t
cusparseDnMatGet(cusparseDnMatDescr_t dnMatDescr,
                 int64_t*             rows,
                 int64_t*             cols,
                 int64_t*             ld,
                 void**               values,
                 cudaDataType*        type,
                 cusparseOrder_t*     order)
```

This function returns the fields of the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dnMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix descriptor</td>
</tr>
<tr>
<td><code>rows</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of rows of the dense matrix</td>
</tr>
<tr>
<td><code>cols</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Number of columns of the dense matrix</td>
</tr>
<tr>
<td><code>ld</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Leading dimension of the dense matrix</td>
</tr>
<tr>
<td><code>values</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the dense matrix. Array of size <code>ld * cols</code></td>
</tr>
<tr>
<td><code>valueType</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Enumerator specifying the datatype of <code>values</code></td>
</tr>
<tr>
<td><code>order</code></td>
<td>HOST</td>
<td>OUT</td>
<td>Enumerator specifying the memory layout of the dense matrix</td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status.

### 14.5.4. `cusparseDnMatGetValues()`

```c
cusparseStatus_t
cusparseDnMatGetValues(cusparseDnMatDescr_t dnMatDescr,
                       void**               values)
```

This function returns the `values` field of the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dnMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix descriptor</td>
</tr>
<tr>
<td><code>values</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the dense matrix. Array of size <code>ld * cols</code></td>
</tr>
</tbody>
</table>

See `cusparseStatus_t` for the description of the return status.

### 14.5.5. `cusparseDnSetValues()`

```c
cusparseStatus_t
cusparseDnSetValues(cusparseDnMatDescr_t dnMatDescr,
                    void*                values)
```

This function sets the `values` field of the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dnMatDescr</code></td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix descriptor</td>
</tr>
<tr>
<td><code>values</code></td>
<td>DEVICE</td>
<td>OUT</td>
<td>Values of the dense matrix. Array of size <code>ld * cols</code></td>
</tr>
</tbody>
</table>
### cusparseDnMatGetStridedBatch()

```c
 cusparseStatus_t
 cusparseDnMatGetStridedBatch(cusparseDnMatDescr_t dnMatDescr,
                             int* batchCount,
                             int64_t* batchStride)
```

The function returns the number of batches and the batch stride of the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix descriptor</td>
</tr>
<tr>
<td>batchCount</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of batches of the dense matrix</td>
</tr>
<tr>
<td>batchStride</td>
<td>HOST</td>
<td>OUT</td>
<td>Address offset between a matrix and the next one in the batch</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status.

### cusparseDnMatSetStridedBatch()

```c
 cusparseStatus_t
 cusparseDnMatSetStridedBatch(cusparseDnMatDescr_t dnMatDescr,
                               int batchCount,
                               int64_t batchStride)
```

The function sets the number of batches and the batch stride of the dense matrix descriptor `dnMatDescr`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnMatDescr</td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix descriptor</td>
</tr>
<tr>
<td>batchCount</td>
<td>HOST</td>
<td>IN</td>
<td>Number of batches of the dense matrix</td>
</tr>
<tr>
<td>batchStride</td>
<td>HOST</td>
<td>IN</td>
<td>Address offset between a matrix and the next one in the batch. <code>batchStride ≥ ld * cols</code> if the matrix uses column-major layout, <code>batchStride ≥ ld * rows</code> otherwise.</td>
</tr>
</tbody>
</table>

See [cusparseStatus_t](#) for the description of the return status.

### Generic API Functions
14.6.1. cusparseSparseToDense()

The function converts the sparse matrix \( \text{matA} \) in CSR, CSC, or COO format into its dense representation \( \text{matB} \). Blocked-ELL is not currently supported.

The function `cusparseSparseToDense_bufferSize()` returns the size of the workspace needed by `cusparseSparseToDense()`.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>
</tr>
<tr>
<td>( \text{matA} )</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix ( \text{A} )</td>
</tr>
<tr>
<td>( \text{matB} )</td>
<td>HOST</td>
<td>OUT</td>
<td>Dense matrix ( \text{B} )</td>
</tr>
<tr>
<td>alg</td>
<td>HOST</td>
<td>IN</td>
<td>Algorithm for the computation</td>
</tr>
<tr>
<td>bufferSize</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of bytes of workspace needed by</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><code>cusparseSparseToDense()</code></td>
</tr>
<tr>
<td>buffer</td>
<td>DEVICE</td>
<td>IN</td>
<td>Pointer to workspace buffer</td>
</tr>
</tbody>
</table>

cusparseSparseToDense() supports the following index type for representing the sparse matrix \( \text{matA} \):

- 32-bit indices ([CUSPARSE_INDEX_32I])
- 64-bit indices ([CUSPARSE_INDEX_64I])

cusparseSparseToDense() supports the following datatypes:

<table>
<thead>
<tr>
<th>A/B</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
</tr>
<tr>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td>CUDA_C_16F</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
</tr>
<tr>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>
cusparseSparse2Dense() supports the following algorithm:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SPARSETODENSE_ALG_DEFAULT</td>
<td>Default algorithm</td>
</tr>
</tbody>
</table>

cusparseSparseToDense() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- Provides deterministic (bit-wise) results for each run

cusparseSparseToDense() supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See cusparseStatus_t for the description of the return status

Please visit cuSPARSE Library Samples - cusparseSparseToDense for a code example.

14.6.2. cusparseDenseToSparse()

cusparseDenseToSparse_bufferSize (cusparseHandle_t handle,
cusparseDnMatDescr_t matA,
cusparseSpMatDescr_t matB,
cusparseDenseToSparseAlg_t alg,
size_t* bufferSize)

cusparseDenseToSparse_analysis (cusparseHandle_t handle,
cusparseDnMatDescr_t matA,
cusparseSpMatDescr_t matB,
cusparseDenseToSparseAlg_t alg,
void* buffer)

cusparseDenseToSparse_convert (cusparseHandle_t handle,
cusparseDnMatDescr_t matA,
cusparseSpMatDescr_t matB,
cusparseDenseToSparseAlg_t alg,
void* buffer)

The function converts the dense matrix matA into a sparse matrix matB in CSR, CSC, COO, or Blocked-ELL format.

The function cusparseDenseToSparse_bufferSize() returns the size of the workspace needed by cusparseDenseToSparse_analysis().

The function cusparseDenseToSparse_analysis() updates the number of non-zero elements in the sparse matrix descriptor matB. The user is responsible to allocate the memory required by the sparse matrix:
Row/Column indices and value arrays for CSC and CSR respectively
Row, column, value arrays for COO
Column (\texttt{ellColInd}), value (\texttt{ellValue}) arrays for Blocked-ELL

Finally, we call \texttt{cusparseDenseToSparse\_convert()} for filling the arrays allocated in the previous step.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>
</tr>
<tr>
<td>matA</td>
<td>HOST</td>
<td>IN</td>
<td>Dense matrix ( A )</td>
</tr>
<tr>
<td>matB</td>
<td>HOST</td>
<td>OUT</td>
<td>Sparse matrix ( B )</td>
</tr>
<tr>
<td>alg</td>
<td>HOST</td>
<td>IN</td>
<td>Algorithm for the computation</td>
</tr>
<tr>
<td>bufferSize</td>
<td>HOST</td>
<td>OUT</td>
<td>Number of bytes of workspace needed by \texttt{cusparseDenseToSparse_analysis()}</td>
</tr>
<tr>
<td>buffer</td>
<td>DEVICE</td>
<td>IN</td>
<td>Pointer to workspace buffer</td>
</tr>
</tbody>
</table>

\texttt{cusparseDenseToSparse()} supports the following index type for representing the sparse vector \( matB \):

- 32-bit indices (\texttt{CUSPARSE\_INDEX\_32I})
- 64-bit indices (\texttt{CUSPARSE\_INDEX\_64I})

\texttt{cusparseDenseToSparse()} supports the following datatypes:

<table>
<thead>
<tr>
<th>A/B</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
</tr>
<tr>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td>CUDA_C_16F</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
</tr>
<tr>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

\texttt{cusparseDense2Sparse()} supports the following algorithm:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{CUSPARSE_DENSE_TO_SPARSE_ALG_DEFAULT}</td>
<td>Default algorithm</td>
</tr>
</tbody>
</table>

\texttt{cusparseDenseToSparse()} has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- Provides deterministic (bit-wise) results for each run

\texttt{cusparseDenseToSparse()} supports the following optimizations:
- The routine supports does not support CUDA graph capture for CSR, CSC, COO formats
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status

Please visit cuSPARSE Library Samples - cusparseDenseToSparse [CSR] and cuSPARSE Library Samples - cusparseDenseToSparse [Blocked-ELL] for code examples.

### 14.6.3. cusparseAxpby()

```c
cusparseStatus_t cusparseAxpby(cusparseHandle_t handle,
const void* alpha,
cusparseSpVecDescr_t vecX,
const void* beta,
cusparseDnVecDescr_t vecY)
```

The function computes the sum of a sparse vector `vecX` and a dense vector `vecY`

\[ Y = \alpha X + \beta Y \]

In other words,

```c
for i=0 to n-1
    Y[i] = beta * Y[i]
for i=0 to nnz-1
    Y[X_indices[i]] += alpha * X_values[i]
```

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>
</tr>
<tr>
<td>alpha</td>
<td>HOST or DEVICE</td>
<td>IN</td>
<td>( \alpha ) scalar used for multiplication</td>
</tr>
<tr>
<td>vecX</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector ( X )</td>
</tr>
<tr>
<td>beta</td>

</tbody>
</table>

`cusparseAxpby` supports the following index type for representing the sparse vector `vecX`:

- 32-bit indices [CUSPARSE_INDEX_32I]
- 64-bit indices [CUSPARSE_INDEX_64I]

`cusparseAxpby` supports the following datatypes:

Uniform-precision computation:

<table>
<thead>
<tr>
<th>X/Y/compute</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td></td>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td></td>
<td>CUDA_C_32F</td>
</tr>
</tbody>
</table>
Mixed-precision computation:

<table>
<thead>
<tr>
<th>x/y</th>
<th>compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>

</tr>
<tr>
<td>CUDA_C_16F</td>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
<td></td>
</tr>
</tbody>
</table>

cusparseAxpby() has the following constraints:
- The arrays representing the sparse vector vecX must be aligned to 16 bytes

cusparseAxpby() has the following properties:
- The routine requires no extra storage
- The routine supports asynchronous execution
- Provides deterministic (bit-wise) results for each run if the the sparse vector vecX indices are distinct

cusparseAxpby() supports the following optimizations:
- CUDA graph capture
- Hardware Memory Compression

See cusparseStatus_t for the description of the return status

Please visit cuSPARSE Library Samples - cusparseAxpby for a code example.

14.6.4. cusparseGather()

cusparseStatus_t cusparseGather(cusparseHandle_t handle, cusparseDnVecDescr_t vecY, cusparseSpVecDescr_t vecX)

The function gathers the elements of the dense vector vecY into the sparse vector vecX.

In other words,

```plaintext```
for i=0 to nnz-1
   X_values[i] = Y[X_indices[i]]
```

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>

<td>CUDA_C_32F</td>
</tr>
<tr>
<td></td>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

cusparseGather() has the following constraints:

- The arrays representing the sparse vector vecX must be aligned to 16 bytes

cusparseGather() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- Provides deterministic (bit-wise) results for each run if the the sparse vector vecX indices are distinct

cusparseGather() supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See \text{cusparseStatus_t} for the description of the return status

Please visit cuSPARSE Library Samples - cusparseGather for a code example.

14.6.5. cusparseScatter()

cusparseStatus_t cusparseScatter(cusparseHandle_t handle, cusparseSpVecDescr_t vecX, cusparseDnVecDescr_t vecY)

The function scatters the elements of the sparse vector vecX into the dense vector vecY
In other words,

\[
\text{for } i = 0 \text{ to } \text{nnz}-1 \\
\quad Y[X \text{\_indices}[i]] = X \text{\_values}[i]
\]
### cusparseScatter

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>
</tr>
<tr>
<td>vecX</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse vector X</td>
</tr>
<tr>
<td>vecY</td>
<td>HOST</td>
<td>OUT</td>
<td>Dense vector Y</td>
</tr>
</tbody>
</table>

**cusparseScatter** supports the following index type for representing the sparse vector `vecX`:

- 32-bit indices (`CUSPARSE_INDEX_32I`)
- 64-bit indices (`CUSPARSE_INDEX_64I`)

**cusparseScatter** supports the following datatypes:

<table>
<thead>
<tr>
<th>x/y</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
</tr>
<tr>

</tr>
<tr>
<td>CUDA_C_16F</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
</tr>
<tr>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

**cusparseScatter()** has the following constraints:

- The arrays representing the sparse vector `vecX` must be aligned to 16 bytes

**cusparseScatter()** has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- Provides deterministic (bit-wise) results for each run if the the sparse vector `vecX` indices are distinct

**cusparseScatter()** supports the following **optimizations**:

- CUDA graph capture
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status

Please visit cuSPARSE Library Samples - cusparseScatter for a code example.

### 14.6.6. cusparseRot

```c
 cusparseStatus_t
 cusparseRot(cusparseHandle_t     handle,
                const void*          c_coeff,
```

**cusparseRot()**
The function computes the Givens rotation matrix

\[
G = \begin{bmatrix}
  c & s \\
  -s & c \\
\end{bmatrix}
\]

to a sparse \textit{vecX} and a dense vector \textit{vecY}

In other words,

\begin{align*}
  Y[X\textit{indices}[i]] &= c \cdot Y[X\textit{indices}[i]] - s \cdot X\textit{values}[i] \\
  X\textit{values}[i] &= c \cdot X\textit{values}[i] + s \cdot Y[X\textit{indices}[i]]
\end{align*}

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>
</tr>
<tr>
<td>\textit{c} _coeff</td>
<td>HOST or DEVICE</td>
<td>IN</td>
<td>cosine element of the rotation matrix</td>
</tr>
<tr>
<td>\textit{vecX}</td>
<td>HOST</td>
<td>IN/OUT</td>
<td>Sparse vector \textit{X}</td>
</tr>
<tr>
<td>\textit{s} _coeff</td>
<td>HOST or DEVICE</td>
<td>IN</td>
<td>sine element of the rotation matrix</td>
</tr>
<tr>
<td>\textit{vecY}</td>
<td>HOST</td>
<td>IN/OUT</td>
<td>Dense vector \textit{Y}</td>
</tr>
</tbody>
</table>

cusparseRot supports the following index type for representing the sparse vector \textit{vecX}:

- 32-bit indices (CUSPARSE_INDEX_32I)
- 64-bit indices (CUSPARSE_INDEX_64I)

cusparseRot supports the following datatypes:

Uniform-precision computation:

<table>
<thead>
<tr>
<th>X/Y/compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

Mixed-precision computation:

<table>
<thead>
<tr>
<th>X/Y</th>
<th>compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_C_16F</td>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
<td>CUDA_C_32F</td>
</tr>
</tbody>
</table>

cusparseRot() has the following constraints:

- The arrays representing the sparse vector \textit{vecX} must be aligned to 16 bytes
cusparseRot() has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- Provides deterministic (bit-wise) results for each run if the the sparse vector vecX indices are distinct

cusparseRot() supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See cusparseStatus_t for the description of the return status

Please visit cuSPARSE Library Samples - cusparseRot for a code example.

### 14.6.7. cusparseSpVV()

```c
cusparseStatus_t
cusparseSpVV_bufferSize(cusparseHandle_t     handle,
                         cusparseOperation_t  opX,
                         cusparseSpVecDescr_t vecX,
                         cusparseDnVecDescr_t vecY,
                         void*                result,
                         cudaDataType         computeType,
                         size_t*              bufferSize)
```

```c
cusparseStatus_t
cusparseSpVV(cusparseHandle_t     handle,
             cusparseOperation_t  opX,
             cusparseSpVecDescr_t vecX,
             cusparseDnVecDescr_t vecY,
             void*                result,
             cudaDataType         computeType,
             void*                externalBuffer)
```

The function computes the inner dot product of a sparse vector vecX and a dense vector vecY

\[
result = \mathbf{X}' \cdot \mathbf{Y}
\]

In other words,

```c
result = 0;
for i=0 to nnz-1
    result += X_values[i] * Y[X_indices[i]]
```

\[
op(X) = \begin{cases} 
X & \text{if } \text{op(X)} = \text{CUSPARSE_OPERATION_ NON_TRANSPOSE} \\
X^* & \text{if } \text{op(X)} = \text{CUSPARSE_OPERATION_ CONJUGATE_TRANSPOSE}
\end{cases}
\]

The function cusparseSpVV_bufferSize() returns the size of the workspace needed by cusparseSpVV().

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>
</tr>
<tr>
<td>Param.</td>
<td>Memory</td>
<td>In/out</td>
<td>Meaning</td>
</tr>
<tr>
<td>----------</td>

<td>Number of bytes of workspace needed by $\text{cusparseSpVV}$</td>
</tr>
<tr>
<td>externalBuffer</td>
<td>DEVICE</td>
<td>IN</td>
<td>Pointer to a workspace buffer of at least bufferSize bytes</td>
</tr>
</tbody>
</table>

$\text{cusparseSpVV}$ supports the following index type for representing the sparse vector $\text{vecX}$:

- 32-bit indices (CUSPARSE_INDEX_32I)
- 64-bit indices (CUSPARSE_INDEX_64I)

The datatypes combinations currently supported for $\text{cusparseSpVV}$ are listed below:

**Uniform-precision computation:**

<table>
<thead>
<tr>
<th>$X/Y$/computeType</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

**Mixed-precision computation:**

<table>
<thead>
<tr>
<th>$X/Y$</th>
<th>computeType/result</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_8I</td>
<td>CUDA_R_32I</td>
</tr>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
<td>CUDA_C_32F</td>
</tr>
</tbody>
</table>

$\text{cusparseSpVV}()$ has the following constraints:

- The arrays representing the sparse vector $\text{vecX}$ must be aligned to 16 bytes

$\text{cusparseSpVV}()$ has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
Provides deterministic (bit-wise) results for each run if the the sparse vector `vecX` indices are distinct.

cusparseSpVV() supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status.

Please visit cuSPARSE Library Samples - cusparseSpVV for a code example.

### 14.6.8. cusparseSpMV()

This function performs the multiplication of a sparse matrix `matA` and a dense vector `vecX` where:

\[ Y = \alpha op(A) \cdot X + \beta Y \]

where:

- `op(A)` is a sparse matrix of size `m \times k`
- `X` is a dense vector of size `k`
- `Y` is a dense vector of size `m`
- `\alpha` and `\beta` are scalars

Also, for matrix `A`
The function `cusparseSpMV_bufferSize()` returns the size of the workspace needed by `cusparseSpMV()`.

<table>
<thead>
<tr>
<th>Param.</th>

<td>IN</td>
<td>Pointer to a workspace buffer of at least <code>bufferSize</code> bytes</td>
</tr>
</tbody>
</table>

The sparse matrix formats currently supported are listed below:

- `CUSPARSE_FORMAT_COO`
- `CUSPARSE_FORMAT_COO_AOS` [deprecated]
- `CUSPARSE_FORMAT_CSR`

`cusparseSpMV` supports the following index type for representing the sparse matrix `matA`:

- 32-bit indices (`CUSPARSE_INDEX_32I`)
- 64-bit indices (`CUSPARSE_INDEX_64I`)

`cusparseSpMV` supports the following datatypes:

**Uniform-precision computation:**

<table>
<thead>
<tr>
<th>( \alpha/\beta/\gamma/\text{computeType} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_64F</td>

<td></td>
</tr>
<tr>
<td>CUSPARSE_COOMV_ALG</td>
<td>Default algorithm for COO sparse matrix format. May produce slightly</td>
</tr>
<tr>
<td>[D]</td>
<td>different results during different runs with the same input parameters</td>
</tr>
<tr>
<td>CUSPARSE_SPMV_COO_ALG1</td>
<td>Provides deterministic [bit-wise] results for each run. If opA ! =</td>
</tr>
<tr>
<td></td>
<td>CUSPARSE_OPERATION_NON_TRANSPOSE, it is identical to</td>
</tr>
<tr>
<td></td>
<td>CUSPARSE_SPMV_COO_ALG1</td>
</tr>
<tr>
<td>CUSPARSE_CSRMV_ALG1 [D]</td>
<td>Default algorithm for CSR sparse matrix format. May produce slightly</td>
</tr>
<tr>
<td></td>
<td>different results during different runs with the same input parameters</td>
</tr>
<tr>
<td>CUSPARSE_SPMV_CSR_ALG1</td>
<td></td>
</tr>
<tr>
<td>CUSPARSE_CSRMV_ALG2 [D]</td>
<td>Provides deterministic [bit-wise] results for each run. If opA ! =</td>
</tr>
<tr>
<td>[D]</td>
<td>CUSPARSE_OPERATION_NON_TRANSPOSE, it is identical to</td>
</tr>
<tr>
<td></td>
<td>CUSPARSE_SPMV_COO_ALG1</td>
</tr>
</tbody>
</table>

Performance notes:

- CUSPARSE_SPMV_COO_ALG1 and CUSPARSE_SPMV_CSR_ALG1 provide higher performance than CUSPARSE_SPMV_COO_ALG2 and CUSPARSE_SPMV_CSR_ALG2.
- In general, opA == CUSPARSE_OPERATION_NON_TRANSPOSE is 3x faster than opA != CUSPARSE_OPERATION_NON_TRANSPOSE.

cusparseSpMV() has the following properties:

- The routine requires extra storage for CSR format [all algorithms] and for COO format with CUSPARSE_SPMV_COO_ALG2 algorithm.
- Provides deterministic (bit-wise) results for each run only for CUSPARSE_SPMM_COO_ALG2 and CUSPARSE_SPMM_CSR_ALG2 algorithms, and \( \text{opA} == \text{CUSPARSE}\_\text{OPERATION}\_\text{NON\_TRANSPOSE} \).
- The routine supports asynchronous execution.

`cusparseSpMV()` supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status

Please visit cuSPARSE Library Samples - cusparseSpMV CSR and cusparseSpMV COO for a code example.

### 14.6.9. cusparseSpSV()

```c
 cusparseStatus_t
cusparseSpSV_createDescr(cusparseSpSVDescr_t* spsvDescr);

cusparseStatus_t
cusparseSpSV_destroyDescr(cusparseSpSVDescr_t spsvDescr);

cusparseStatus_t
cusparseSpSV_bufferSize(cusparseHandle_t     handle,
                    cusparseOperation_t  opA,
                    const void*          alpha,
                    cusparseSpMatDescr_t matA,
                    cusparseDnVecDescr_t vecX,
                    cusparseDnVecDescr_t vecY,
                    cudaDataType         computeType,
                    cusparseSpSVAlg_t    alg,
                    cusparseSpSVDescr_t  spsvDescr,
                    size_t*              bufferSize)

cusparseStatus_t
cusparseSpSV_analysis(cusparseHandle_t     handle,
                    cusparseOperation_t  opA,
                    const void*          alpha,
                    cusparseSpMatDescr_t matA,
                    cusparseDnVecDescr_t vecX,
                    cusparseDnVecDescr_t vecY,
                    cudaDataType         computeType,
                    cusparseSpSVAlg_t    alg,
                    cusparseSpSVDescr_t  spsvDescr,
                    void*                externalBuffer)

cusparseStatus_t
cusparseSpSV_solve(cusparseHandle_t     handle,
                    cusparseOperation_t  opA,
                    const void*          alpha,
                    cusparseSpMatDescr_t matA,
                    cusparseDnVecDescr_t vecX,
                    cusparseDnVecDescr_t vecY,
                    cudaDataType         computeType,
                    cusparseSpSVAlg_t    alg,
```
The function solves a system of linear equations whose coefficients are represented in a sparse triangular matrix:

\[ \text{op}(A) \cdot Y = \alpha X \]

where

- \( \text{op}(A) \) is a sparse square matrix of size \( m \times m \)
- \( X \) is a dense vector of size \( m \)
- \( Y \) is a dense vector of size \( m \)
- \( \alpha \) is a scalar

Also, for matrix \( A \)

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases}
\]

The function `cusparseSpSV_bufferSize()` returns the size of the workspace needed by `cusparseSpSV_analysis()` and `cusparseSpSV_solve()`. The function `cusparseSpSV_analysis()` performs the analysis phase, while `cusparseSpSV_solve()` executes the solve phase for a sparse triangular linear system. The opaque data structure `spsvDescr` is used to share information among all functions.

The routine supports arbitrary sparsity for the input matrix, but only the upper or lower triangular part is taken into account in the computation.

<td>Opaque descriptor for storing internal data used across the three steps</td>
</tr>
</tbody>
</table>
The sparse matrix formats currently supported are listed below:

- `CUSPARSE_FORMAT_CSR`
- `CUSPARSE_FORMAT_COO`

The `cusparseSpSV()` supports the following shapes and properties:

- `CUSPARSE_FILL_MODE_LOWER` and `CUSPARSE_FILL_MODE_UPPER` fill modes
- `CUSPARSE_DIAG_TYPE_NON_UNIT` and `CUSPARSE_DIAG_TYPE_UNIT` diagonal types

The fill mode and diagonal type can be set by `cusparseSpMatSetAttribute()`. `cusparseSpSV()` supports the following index type for representing the sparse matrix `matA`:

- 32-bit indices `[CUSPARSE_INDEX_32I]`
- 64-bit indices `[CUSPARSE_INDEX_64I]`

`cusparseSpSV()` supports the following datatypes:

Uniform-precision computation:

<table>
<thead>
<tr>
<th>A/X/ Y/computeType</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

`cusparseSpSV()` supports the following algorithms:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SPSV_ALG_DEFAULT</td>
<td>default algorithm</td>
</tr>
</tbody>
</table>

`cusparseSpSV()` has the following properties:

- The routine requires extra storage for the analysis phase which is proportional to number of non-zero entries of the sparse matrix
- Provides deterministic (bit-wise) results for each run for the solving phase `cusparseSpSV_solve()`
- The routine supports asynchronous execution

`cusparseSpSV()` supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status.

Please visit cuSPARSE Library Samples - cusparseSpSV CSR and cuSPARSE Library Samples - cusparseSpSV COO for code examples.
14.6.10. cusparseSpMM()

```c
 cusparseStatus_t
cusparseSpMM_bufferSize(cusparseHandle_t handle,
cusparseOperation_t opA,
cusparseOperation_t opB,
const void* alpha,
cusparseSpMatDescr_t matA,
cusparseDnMatDescr_t matB,
const void* beta,
cusparseDnMatDescr_t matC,
cudaDataType computeType,
cusparseSpMMAlg_t alg,
size_t* bufferSize)
```

```c
 cusparseStatus_t
cusparseSpMM_preprocess(cusparseHandle_t handle,
cusparseOperation_t opA,
cusparseOperation_t opB,
const void* alpha,
cusparseSpMatDescr_t matA,
cusparseDnMatDescr_t matB,
const void* beta,
cusparseDnMatDescr_t matC,
cudaDataType computeType,
cusparseSpMMAlg_t alg,
void* externalBuffer)
```

```c
 cusparseStatus_t
 cusparseSpMM(cusparseHandle_t handle,
cusparseOperation_t opA,
cusparseOperation_t opB,
const void* alpha,
cusparseSpMatDescr_t matA,
cusparseDnMatDescr_t matB,
const void* beta,
cusparseDnMatDescr_t matC,
cudaDataType computeType,
cusparseSpMMAlg_t alg,
void* externalBuffer)
```

The function performs the multiplication of a sparse matrix $\text{matA}$ and a dense matrix $\text{matB}$

\[ C = \alpha \text{op}(A) \cdot \text{op}(B) + \beta C \]

where

- $\text{op}(A)$ is a sparse matrix of size $m \times k$
- $\text{op}(B)$ is a dense matrix of size $k \times n$
- $C$ is a dense matrix of size $m \times n$
- $\alpha$ and $\beta$ are scalars

The routine can be also used to perform the multiplication of a dense matrix $\text{matB}$ and a sparse matrix $\text{matA}$ by switching the dense matrices layout:
\[
\begin{align*}
C_C &= B_C \cdot A + \beta C_C \\
C_R &= A^T \cdot B_R + \beta C_R
\end{align*}
\]

where \( B_C, C_C \) indicate column-major layout, while \( B_R, C_R \) refer to row-major layout.

Also, for matrix A and B

\[
\begin{align*}
\text{op}(A) &= \begin{cases} 
A & \text{if op(A) == CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if op(A) == CUSPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if op(A) == CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases} \\
\text{op}(B) &= \begin{cases} 
B & \text{if op(B) == CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
B^T & \text{if op(B) == CUSPARSE\_OPERATION\_TRANSPOSE} \\
B^H & \text{if op(B) == CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
\end{cases}
\end{align*}
\]

When using the (conjugate) transpose of the sparse matrix A, this routine may produce slightly different results during different runs with the same input parameters.

The function \text{cusparseSpMM\_bufferSize()} returns the size of the workspace needed by \text{cusparseSpMM}()

The function \text{cusparseSpMM\_preprocess()} can be called before \text{cusparseSpMM} to speed up the actual computation. It is useful when \text{cusparseSpMM} is called multiple times with the same sparsity pattern (matA). The values of the dense matrices (matB, matC) can change arbitrarily. It requires \text{CUSPARSE\_SPMM\_CSR\_ALG3}. All other formats and algorithm have no effect.

</table>

cusparseSpMM supports the following sparse matrix formats:
cusparseSpMM supports the following index type for representing the sparse matrix matA:

- 32-bit indices (`CUSPARSE_INDEX_32I`)
- 64-bit indices (`CUSPARSE_INDEX_64I`) only with `CUSPARSE_SPMM_COO_ALG4`, `CUSPARSE_SPMM_CSR_ALG2`, and `CUSPARSE_SPMM_CSR_ALG3` algorithms.

cusparseSpMM supports the following datatypes:

**Uniform-precision computation:**

<table>
<thead>
<tr>
<th>A/B</th>
<th>C/<code>computeType</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_16F</td>

</tr>
<tr>
<td>CUSPARSE_SPMM_CSR_ALG3</td>
<td>Algorithm 3 for CSR sparse matrix format</td>
</tr>
</tbody>
</table>
Algorithm | Notes
--- | ---
 - It supports only \( \text{opA} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \) (fallback to \text{CUSPARSE\_SPMM\_CSR\_ALG2})
 - It does not support \text{CUDA\_C\_16F} and \text{CUDA\_C\_16BF} data types

**Performance notes:**

- **Row-major layout provides higher performance than column-major.**

- \text{CUSPARSE\_SPMM\_COO\_ALG4} and \text{CUSPARSE\_SPMM\_CSR\_ALG2} should be used with row-major layout, while \text{CUSPARSE\_SPMM\_COO\_ALG1}, \text{CUSPARSE\_SPMM\_COO\_ALG2}, and \text{CUSPARSE\_SPMM\_COO\_ALG3}, and \text{CUSPARSE\_SPMM\_CSR\_ALG1} with column-major layout.

- For \( \beta \neq 1 \), the output matrix is scaled before the actual computation.

\text{cusparseSpMM()} with \text{CUSPARSE\_SPMM\_COO\_ALG4} and \text{CUSPARSE\_SPMM\_CSR\_ALG2} support the following batch modes:

- \( C_i = A \cdot B_i \)
- \( C_i = A_i \cdot B \)
- \( C_i = A_i \cdot B_i \)

The number of batches and their strides can be set by using \text{cusparseCooSetStridedBatch}, \text{cusparseCsrSetStridedBatch}, and \text{cusparseDnMatSetStridedBatch}.

\text{cusparseSpMM()} has the following properties:

- The routine requires no extra storage for \text{CUSPARSE\_SPMM\_COO\_ALG1}, \text{CUSPARSE\_SPMM\_COO\_ALG3}, \text{CUSPARSE\_SPMM\_COO\_ALG4}, and \text{CUSPARSE\_SPMM\_CSR\_ALG1}

- The routine supports asynchronous execution.

- Provides deterministic (bit-wise) results for each run only for \text{CUSPARSE\_SPMM\_COO\_ALG2} and \text{CUSPARSE\_SPMM\_CSR\_ALG1} algorithms, and \( \text{opA} == \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \)

\text{cusparseSpMM()} supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

Please visit cuSPARSE Library Samples - cusparseSpMM CSR and cusparseSpMM COO for a code example.

(2) **BLOCKED-ELLPACK FORMAT**

cusparseSpMM supports the following datatypes for \text{CUSPARSE\_FORMAT\_BLOCKED\_ELL} format and the following GPU architectures for exploiting NVIDIA Tensor Cores:

<table>
<thead>
<tr>
<th>A/B</th>
<th>C</th>
<th>computeType</th>
<th>opB</th>
<th>Compute Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_16F</td>
<td>CUDA_R_16F</td>
<td>N, T</td>
<td>( \geq 70 )</td>
</tr>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_16F</td>
<td>CUDA_R_32F</td>
<td>N, T</td>
<td>( \geq 70 )</td>
</tr>
</tbody>
</table>
cuSPARSE SpMM supports the following algorithms with CUSPARSE_FORMAT_BLOCKED_ELL format:

[D]: deprecated

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_MM_ALG_DEFAULT</td>
<td>Default algorithm for any sparse matrix format</td>
</tr>
<tr>
<td>CUSPARSE_SPMM_ALG_DEFAULT</td>
<td>Default algorithm for Blocked-ELL format</td>
</tr>
</tbody>
</table>

Performance notes:

- Blocked-ELL SpMM provides the best performance with Power-of-2 Block-Sizes
- Large Block-Sizes (e.g. ≥ 64) provide the best performance

The function has the following limitations:

- The pointer mode must be equal to CUSPARSE_POINTER_MODE_HOST
- Only opA == CUSPARSE_OPERATION_NON_TRANSPOSE is supported
- opB == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE is not supported

Please visit cuSPARSE Library Samples - cusparseSpMM Blocked-ELL for a code example.

See cusparseStatus_t for the description of the return status

14.6.11. cusparseSpSM()

cusparseStatus_t
 cusparseSpSM_createDescr(cusparseSpSMDescr_t* spsmDescr);

cusparseStatus_t
 cusparseSpSM_destroyDescr(cusparseSpSMDescr_t spsmDescr);

cusparseStatus_t
 cusparseSpSM_bufferSize(cusparseHandle_t handle,
 cusparseOperation_t opA,
 cusparseOperation_t opB,
 const void* alpha,
The function solves a system of linear equations whose coefficients are represented in a sparse triangular matrix:

\[ \text{op}(A) \cdot C = \alpha \text{op}(B) \]

where

- \( \text{op}(A) \) is a sparse square matrix of size \( m \times m \)
- \( \text{op}(B) \) is a dense matrix of size \( m \times n \)
- \( C \) is a dense matrix of size \( m \times n \)
- \( \alpha \) is a scalar

Also, for matrix \( A \)

\[
\text{op}(A) = \begin{cases} 
A & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
A^T & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
A^H & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE} 
\end{cases}
\]

Also, for matrix \( B \)

\[
\text{op}(B) = \begin{cases} 
B & \text{if } \text{op}(B) = \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
B^T & \text{if } \text{op}(B) = \text{CUSPARSE\_OPERATION\_TRANSPOSE} 
\end{cases}
\]
The function `cusparseSpSM_bufferSize()` returns the size of the workspace needed by `cusparseSpSM_analysis()` and `cusparseSpSM_solve()`. The function `cusparseSpSM_analysis()` performs the analysis phase, while `cusparseSpSM_solve()` executes the solve phase for a sparse triangular linear system. The opaque data structure `spsmDescr` is used to share information among all functions.

The routine supports arbitrary sparsity for the input matrix, but only the upper or lower triangular part is taken into account in the computation.

`cusparseSpSM_bufferSize()` requires a buffer size for the analysis phase which is proportional to number of non-zero entries of the sparse matrix.

<td>Default algorithm</td>
</tr>
</tbody>
</table>

cusparseSpSM() has the following properties:

- The routine requires no extra storage
- Provides deterministic (bit-wise) results for each run for the solving phase
  cusparseSpSM_solve()
- The routine supports asynchronous execution

cusparseSpSM() supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status.

Please visit cuSPARSE Library Samples - cusparseSpSM CSR and cuSPARSE Library Samples - cusparseSpSM COO for code examples.

### 14.6.12. cusparseConstrainedGeMM() [DEPRECATED]

[[DEPRECATED]] use `cusparseSDDMM()` instead. The routine will be removed in the next major release.

```
cusparseStatus_t cusparseConstrainedGeMM(cusparseHandle_t           handle,        
cusparseOperation_t        opA,       
cusparseOperation_t        opB,       
const void*                alpha,       
cusparseDnMatDescr_t matA,       
cusparseDnMatDescr_t matB,       
const void*                beta,       
cusparseSpMatDescr_t matC,       
cudaDataType               computeType,       
void*                      externalBuffer)       

cusparseStatus_t cusparseConstrainedGeMM_bufferSize(cusparseHandle_t           handle,        
```
The function has the same behavior of \texttt{cusparseSDDMM()}.

### 14.6.13. \texttt{cusparseSDDMM()}\

```
cusparseStatus_t cusparseSDDMM_bufferSize(cusparseHandle_t handle,  
cusparseOperation_t opA,  
cusparseOperation_t opB,  
const void* alpha,  
cusparseDnMatDescr_t matA,  
cusparseDnMatDescr_t matB,  
const void* beta,  
cusparseSpMatDescr_t matC,  
cudaDataType computeType,  
size_t* bufferSize)
```

```
cusparseStatus_t cusparseSDDMM_preprocess(cusparseHandle_t handle,  
cusparseOperation_t opA,  
cusparseOperation_t opB,  
const void* alpha,  
cusparseDnMatDescr_t matA,  
cusparseDnMatDescr_t matB,  
const void* beta,  
cusparseSpMatDescr_t matC,  
cudaDataType computeType,  
cusparseSDDMMAlg_t alg,  
void* externalBuffer)
```

```
cusparseStatus_t cusparseSDDMM(cusparseHandle_t handle,  
cusparseOperation_t opA,  
cusparseOperation_t opB,  
const void* alpha,  
cusparseDnMatDescr_t matA,  
cusparseDnMatDescr_t matB,  
const void* beta,  
cusparseSpMatDescr_t matC,  
cudaDataType computeType,  
cusparseSDDMMAlg_t alg,  
void* externalBuffer)
```

This function performs the multiplication of matA and matB, followed by an element-wise multiplication with the sparsity pattern of matC. Formally, it performs the following operation:

\[
C = \alpha(\text{opA} \cdot \text{opB}) \odot \text{spy}(C) + \beta C
\]
where

- \( \text{op}(A) \) is a dense matrix of size \( m \times k \)
- \( \text{op}(B) \) is a dense matrix of size \( k \times n \)
- \( C \) is a sparse matrix of size \( m \times n \)
- \( \alpha \) and \( \beta \) are scalars
- \( \odot \) denotes the Hadamard (entry-wise) matrix product, and \( \text{spy}(C) \) is the sparsity pattern matrix of \( C \) defined as:
  \[
  \text{spy}(C)_{ij} = \begin{cases} 
  0 & \text{if } C_{ij} = 0 \\ 
  1 & \text{otherwise}
  \end{cases}
  \]

Also, for matrix \( A \) and \( B \)

\[
\text{op}(A) = \begin{cases} 
  A & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
  A^T & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
  A^H & \text{if } \text{op}(A) = \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
  \end{cases}
\]

\[
\text{op}(B) = \begin{cases} 
  B & \text{if } \text{op}(B) = \text{CUSPARSE\_OPERATION\_NON\_TRANSPOSE} \\
  B^T & \text{if } \text{op}(B) = \text{CUSPARSE\_OPERATION\_TRANSPOSE} \\
  B^H & \text{if } \text{op}(B) = \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE}
  \end{cases}
\]

\text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE} is currently not supported.

The function \( \text{cusparseSDDMM\_BufferSize()} \) returns the size of the workspace needed by \( \text{cusparseSDDMM} \) or \( \text{cusparseSDDMM\_preprocess} \).

The function \( \text{cusparseSDDMM\_preprocess()} \) can be called before \( \text{cusparseSDDMM} \) to speedup the actual computation. It is useful when \( \text{cusparseSDDMM} \) is called multiple times with the same sparsity pattern \( \text{matC} \). The values of the dense matrices \( \text{matA}, \text{matB} \) can change arbitrarily.

Currently supported sparse matrix formats:

- **CUSPARSE_FORMAT_CSR**

`cusparseSpSV()` supports the following index type for representing the sparse matrix `matA`:

- 32-bit indices (**CUSPARSE_INDEX_32I**)
- 64-bit indices (**CUSPARSE_INDEX_64I**)

The datatypes combinations currently supported for `cusparseSDDMM` are listed below:

### Uniform-precision computation:

<table>
<thead>
<tr>
<th>A/X</th>
<th>Y/computeType</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td></td>
<td>CUDA_R_64F</td>
</tr>
<tr>
<td></td>
<td>CUDA_C_32F</td>
</tr>
<tr>
<td></td>
<td>CUDA_C_64F</td>
</tr>
</tbody>
</table>

`cusparseSpSV()` supports the following algorithms:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SDDMM_ALG_DEFAULT</td>
<td>default algorithm</td>
</tr>
</tbody>
</table>

`cusparseSDDMM()` has the following properties:

- The routine requires no extra storage
- Provides deterministic (bit-wise) results for each run
- The routine supports asynchronous execution

`cusparseSDDMM()` supports the following optimizations:

- CUDA graph capture
- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status

Please visit [cuSPARSE Library Samples - cusparseSDDMM](#) for a code example.

### 14.6.14. cusparseSpGEMM()

```c

cusparseStatus_t cusparseSpGEMM_createDescr(cusparseSpGEMMDescr_t* descr)
```
This function performs the multiplication of two sparse matrices $\text{matA}$ and $\text{matB}$

$$C = \alpha \text{op(A)} \cdot \text{op(B)} + \beta C$$

where $\alpha$ and $\beta$ are scalars.

The functions `cusparseSpGEMM_workEstimation()` and `cusparseSpGEMM_compute()` are used for both determining the buffer size and performing the actual computation.

</tr>
<tr>
<td>externalBuffer2</td>
<td>DEVICE</td>
<td>IN</td>
<td>Pointer to workspace buffer needed by cusparseSpGEMM_compute and cusparseSpGEMM_copy</td>
</tr>
</tbody>
</table>

**MEMORY REQUIREMENT:** the first invocation of cusparseSpGEMM_compute provides an *upper bound* of the memory required for the computation that is generally several times larger of the actual memory used. The user can provide an arbitrary buffer size bufferSize2 in the second invocation. If it is not sufficient, the routine will returns CUSPARSE_STATUS_INSUFFICIENT_RESOURCES status.

Currently, the function has the following limitations:

- Only 32-bit indices CUSPARSE_INDEX_32I is supported
- Only CSR format CUSPARSE_FORMAT_CSR is supported
- Only opA, opB equal to CUSPARSE_OPERATION_NON_TRANSPOSE are supported

The datatypes combinations currently supported for cusparseSpGEMM are listed below:

**Uniform-precision computation:**

<table>
<thead>
<tr>
<th>$A/B/C/computeType</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td></td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
<td></td>
</tr>
<tr>
<td>CUDA_R_32F</td>
<td></td>
</tr>
</tbody>
</table>
### A/B/C/computeType

- CUDA_R_64F
- CUDA_C_16F
- CUDA_C_16BF
- CUDA_C_32F
- CUDA_C_64F

The `cusparseSpGEMM` routine runs for the following algorithm:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SPGEMM_DEFAULT</td>
<td>Default algorithm. Provides deterministic (bit-wise) results for each run</td>
</tr>
</tbody>
</table>

`cusparseSpGEMM` has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports does not support CUDA graph capture

`cusparseSpGEMM` supports the following optimizations:

- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status.

Please visit **cuSPARSE Library Samples - cusparseSpGEMM** for a code example.

### 14.6.15. cusparseSpGEMMreuse()

```c
 cusparseStatus_t
 cusparseSpGEMM_createDescr(cusparseSpGEMMDescr_t* descr)

 cusparseStatus_t
 cusparseSpGEMM_destroyDescr(cusparseSpGEMMDescr_t descr)

 cusparseStatus_t
 cusparseSpGEMMreuse_workEstimation(cusparseHandle_t handle,
                                    cusparseOperation_t opA,
                                    cusparseOperation_t opB,
                                    cusparseSpMatDescr_t matA,
                                    cusparseSpMatDescr_t matB,
                                    cusparseSpMatDescr_t matC,
                                    cusparseSpGEMMAlg_t alg,
                                    cusparseSpGEMMDescr_t spgemmDescr,
                                    size_t* bufferSize1,
                                    void* externalBuffer1)

 cusparseStatus_t
 cusparseSpGEMMreuse_nnz(cusparseHandle_t handle,
                        cusparseOperation_t opA,
                        cusparseOperation_t opB,
                        cusparseSpMatDescr_t matA,
                        ```
This function performs the multiplication of two sparse matrices matA and matB where the structure of the output matrix matC can be reused for multiple computations with different values.

\[ C = \alpha op(A) \cdot op(B) + \beta C \]

where \( \alpha \) and \( \beta \) are scalars.

The functions `cusparseSpGEMMreuse_workEstimation()`, `cusparseSpGEMMreuse_nnz()`, and `cusparseSpGEMMreuse_copy()` are used for determining the buffer size and performing the actual computation.

<table>
<thead>
<tr>
<th>Param.</th>
<th>Memory</th>
<th>In/out</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>HOST</td>
<td>IN</td>
<td>Handle to the cuSPARSE library context</td>

<tr>
<td>matA</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix A</td>
</tr>
<tr>
<td>matB</td>
<td>HOST</td>
<td>IN</td>
<td>Sparse matrix B</td>
</tr>
</tbody>
</table>
### Param. | Memory | In/out | Meaning
--- | --- | --- | ---
beta | HOST or DEVICE | IN | $\beta$ scalar used for multiplication
matC | HOST | IN/OUT | Sparse matrix C
computeType | HOST | IN | Enumerator specifying the datatype in which the computation is executed
alg | HOST | IN | Enumerator specifying the algorithm for the computation
spgemmDescr | HOST | IN/OUT | Opaque descriptor for storing internal data used across the three steps
bufferSize1 | HOST | IN/OUT | Number of bytes of workspace requested by `cusparseSpGEMMreuse_workEstimation`
bufferSize2 | HOST | IN/OUT | Number of bytes of workspace requested by `cusparseSpGEMMreuse_nnz`
bufferSize3 | HOST | IN/OUT | Number of bytes of workspace requested by `cusparseSpGEMMreuse_nnz`
bufferSize4 | HOST | IN/OUT | Number of bytes of workspace requested by `cusparseSpGEMMreuse_copy`
bufferSize5 | HOST | IN/OUT | Number of bytes of workspace requested by `cusparseSpGEMMreuse_copy`
externalBuffer1 | DEVICE | IN | Pointer to workspace buffer needed by `cusparseSpGEMMreuse_workEstimation` and `cusparseSpGEMMreuse_nnz`
externalBuffer2 | DEVICE | IN | Pointer to workspace buffer needed by `cusparseSpGEMMreuse_nnz`
externalBuffer3 | DEVICE | IN | Pointer to workspace buffer needed by `cusparseSpGEMMreuse_nnz` and `cusparseSpGEMMreuse_copy`
externalBuffer4 | DEVICE | IN | Pointer to workspace buffer needed by `cusparseSpGEMMreuse_nnz` and `cusparseSpGEMMreuse_compute`
externalBuffer5 | DEVICE | IN | Pointer to workspace buffer needed by `cusparseSpGEMMreuse_copy` and `cusparseSpGEMMreuse_compute`

**MEMORY REQUIREMENT:** `cusparseSpGEMMreuse` requires to keep in memory all intermediate products to reuse the structure of the output matrix. On the other hand, the number of intermediate products is orders of magnitude higher than the number of non-zero entries in general. In order to minimize the memory requirements, the routine uses multiple buffers that can be deallocated after they are no more needed. If the number of intermediate product exceeds $2^{31}-1$, the routine will return `CUSPARSE_STATUS_INSUFFICIENT_RESOURCES` status.

Currently, the function has the following limitations:
- Only 32-bit indices `CUSPARSE_INDEX_32I` is supported
- Only CSR format `CUSPARSE_FORMAT_CSR` is supported
- Only `opA`, `opB` equal to `CUSPARSE_OPERATION_NON_TRANSPOSE` are supported

---
The datatypes combinations currently supported for `cusparseSpGEMMreuse` are listed below:

**Uniform-precision computation:**

<table>
<thead>
<tr>
<th>A/B</th>
<th>C</th>
<th>computeType</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_32F</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUDA_R_64F</td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>CUDA_C_16BF</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUDA_C_32F</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUDA_C_64F</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Mixed-precision computation:**

<table>
<thead>
<tr>
<th>A/B</th>
<th>C</th>
<th>computeType</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUDA_R_16F</td>
<td>CUDA_R_16F</td>
<td>CUDA_R_32F</td>
</tr>
<tr>
<td>CUDA_R_16BF</td>
<td>CUDA_R_16BF</td>
<td>CUDA_R_32F</td>
</tr>
</tbody>
</table>

cusparseSpGEMMreuse() routine runs for the following algorithm:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Notes</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSPARSE_SPGEMM_DEFAULT</td>
<td>Default algorithm. Provides deterministic [bit-wise] structure for the output matrix for each run, while value computation is not deterministic</td>
<td></td>
</tr>
<tr>
<td>CUSPARSE_SPGEMM_CSR_ALG_NONDETERMINISTIC</td>
<td>Provides deterministic [bit-wise] structure for the output matrix and value computation for each run</td>
<td></td>
</tr>
</tbody>
</table>

**cusparseSpGEMMreuse()** has the following properties:

- The routine requires no extra storage
- The routine supports asynchronous execution
- The routine supports does not support CUDA graph capture

**cusparseSpGEMMreuse()** supports the following optimizations:

- Hardware Memory Compression

See `cusparseStatus_t` for the description of the return status

Please visit [cuSPARSE Library Samples - cusparseSpGEMMreuse](#) for a code example.
Chapter 15. Appendix A: cuSPARSE Fortran Bindings

The cuSPARSE library is implemented using the C-based CUDA toolchain, and it thus provides a C-style API that makes interfacing to applications written in C or C++ trivial. There are also many applications implemented in Fortran that would benefit from using cuSPARSE, and therefore a cuSPARSE Fortran interface has been developed.

Unfortunately, Fortran-to-C calling conventions are not standardized and differ by platform and toolchain. In particular, differences may exist in the following areas:

Symbol names (capitalization, name decoration)

Argument passing (by value or reference)

Passing of pointer arguments (size of the pointer)

To provide maximum flexibility in addressing those differences, the cuSPARSE Fortran interface is provided in the form of wrapper functions, which are written in C and are located in the file cusparse_fortran.c. This file also contains a few additional wrapper functions (for cudaMalloc(), cudaMemcpy, and so on) that can be used to allocate memory on the GPU.

The cuSPARSE Fortran wrapper code is provided as an example only and needs to be compiled into an application for it to call the cuSPARSE API functions. Providing this source code allows users to make any changes necessary for a particular platform and toolchain.

The cuSPARSE Fortran wrapper code has been used to demonstrate interoperability with the compilers g95 0.91 (on 32-bit and 64-bit Linux) and g95 0.92 (on 32-bit and 64-bit Mac OS X). In order to use other compilers, users have to make any changes to the wrapper code that may be required.

The direct wrappers, intended for production code, substitute device pointers for vector and matrix arguments in all cuSPARSE functions. To use these interfaces, existing applications need to be modified slightly to allocate and deallocate data structures in GPU memory space (using CUDA_MALLOC() and CUDA_FREE()) and to copy data between GPU and CPU memory spaces (using the CUDA_MEMCPY() routines). The sample wrappers provided in cusparse_fortran.c map device pointers to the OS-dependent type size_t, which is 32 bits wide on 32-bit platforms and 64 bits wide on a 64-bit platforms.

One approach to dealing with index arithmetic on device pointers in Fortran code is to use C-style macros and to use the C preprocessor to expand them. On Linux and Mac OS X, preprocessing can be done by using the option '-cpp' with g95 or gfortran. The function
GET_SHIFTED_ADDRESS(), provided with the cuSPARSE Fortran wrappers, can also be used, as shown in example B.

Example B shows the the C++ of example A implemented in Fortran 77 on the host. This example should be compiled with ARCH_64 defined as 1 on a 64-bit OS system and as undefined on a 32-bit OS system. For example, on g95 or gfortran, it can be done directly on the command line using the option -c++ -DARCH_64=1.

17.3. Prune Dense to Sparse by Percentage

This section provides a simple example in the C programming language of pruning a dense matrix to a sparse matrix by percentage.

A is a 4x4 dense matrix,

\[
A = \begin{bmatrix}
1.0 & 0.0 & 2.0 & -3.0 \\
0.0 & 4.0 & 0.0 & 0.0 \\
5.0 & 0.0 & 6.0 & 7.0 \\
0.0 & 8.0 & 0.0 & 9.0
\end{bmatrix}
\]

The percentage is 50, which means to prune 50 percent of the dense matrix. The matrix has 16 elements, so 8 out of 16 must be pruned out. Therefore 7 zeros are pruned out, and value 1.0 is also out because it is the smallest among 9 nonzero elements.

```c
/*
 * How to compile (assume cuda is installed at /usr/local/cuda/)
 *   nvcc -c -I/usr/local/cuda/include prunedense2csrbyP.cpp
 *   g++ -o prunedense2csrbyP prunedense2csrbyP.o -L/usr/local/cuda/lib64
 *     -lcusparse -lcudart
 */
#include <stdio.h>
#include <stdlib.h>
#include <assert.h>
#include <cuda_runtime.h>
#include <cusparse.h>

void printMatrix(int m, int n, const float*A, int lda, const char* name)
{
    for(int row = 0 ; row < m ; row++)
    {
        for(int col = 0 ; col < n ; col++)
        {
            float Areg = A[row + col*lda];
            printf("%s(%d,%d) = %f\n", name, row+1, col+1, Areg);
        }
    }
}

17.4. Prune Sparse to Sparse by Percentage

This section provides a simple example in the C programming language of pruning a sparse matrix to a sparse matrix by percentage.

A is a 4x4 sparse matrix,

\[
A = \begin{bmatrix}
1.0 & 0.0 & 2.0 & -3.0 \\
0.0 & 4.0 & 0.0 & 0.0 \\
5.0 & 0.0 & 6.0 & 7.0 \\
0.0 & 8.0 & 0.0 & 9.0
\end{bmatrix}
\]

The percentage is 20, which means to prune 20 percent of the nonzeros. The sparse matrix has 9 nonzero elements, so 1.4 elements must be pruned out. The function removes 1.0 and 2.0 which are first two smallest numbers of nonzeros.

```c
#include <stdio.h>
#include <stdlib.h>
#include <assert.h>
#include <cuda_runtime.h>
#include <cusparse.h>

void printCsr(
    int m,
    int n,
    int nnz,
    const cusparseMatDescr_t descrA,
    const float *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    const char* name)
{
    const int base = (cusparseGetMatIndexBase(descrA) != CUSPARSE_INDEX_BASE_ONE)? 0:1 ;

    printf("matrix %s is %d-by-%d, nnz=%d, base=%d, output base-1\n", name, m, n, nnz, base);
    for(int row = 0 ; row < m ; row++){
        const int start = csrRowPtrA[row  - base);
        const int end   = csrRowPtrA[row+1]  - base;
        for(int colidx = start ; colidx < end ; colidx++){
            const int col = csrColIndA[colidx]  - base;
            const float Areg = csrValA[colidx];
            printf("%s(%d,%d) = %f\n", name, row+1, col+1, Areg);
        }
    }
}

int main(int argc, char*argv[])
{
    cusparseHandle_t handle = NULL;
    return 0;
}
```

Chapter 18. Appendix D: Examples of gpsv

18.1. Batched Penta-diagonal Solver

This section provides a simple example in the C programming language of gpsvInterleavedBatch.

The example solves two penta-diagonal systems and assumes data layout is NOT interleaved format. Before calling gpsvInterleavedBatch, cublasXgeam is used to transform the data layout, from aggregate format to interleaved format. If the user can prepare interleaved format, no need to transpose the data.

```c
#include <stdio.h>
#include <stdlib.h>
#include <assert.h>
#include <cuda_runtime.h>
#include <cusparse.h>
#include <cublas_v2.h>

/*
* compute |b - A*x|_inf
*/
void residual_eval(
    int n,
    const float *ds,
    const float *dl,
    const float *d,
    const float *du,
    const float *dw,
    const float *b,
    const float *x,
    float *r_nrminf_ptr)
{
    float r_nrminf = 0;
    for(int i = 0 ; i < n ; i++){
        float dot = 0;
        if (i > 1)
            dot += ds[i]*x[i-2];
    }
```
if (i > 0 ){
    dot += dl[i]*x[i-1];
}
dot += d[i]*x[i];
if (i < (n-1 )){
    dot += du[i]*x[i+1];
}
if (i < (n-2 ) ){
    dot += dw[i]*x[i+2];
}
float ri = b[i] - dot;

Chapter 20. Appendix F: Acknowledgements

NVIDIA would like to thank the following individuals and institutions for their contributions:

- The cusparse<t>gtsv implementation is derived from a version developed by Li-Wen Chang from the University of Illinois.
- The cusparse<t>gtsvInterleavedBatch adopts cuThomasBatch developed by Pedro Valero-Lara and Ivan Martínez-Pérez from Barcelona Supercomputing Center and BSC/UPC NVIDIA GPU Center of Excellence.
