Chapter 1. Introduction

The cuRAND library provides facilities that focus on the simple and efficient generation of high-quality pseudorandom and quasirandom numbers. A *pseudorandom* sequence of numbers satisfies most of the statistical properties of a truly random sequence but is generated by a deterministic algorithm. A *quasirandom* sequence of n -dimensional points is generated by a deterministic algorithm designed to fill an n -dimensional space evenly.

cuRAND consists of two pieces: a library on the host (CPU) side and a device (GPU) header file. The host-side library is treated like any other CPU library: users include the header file, `/include/curand.h`, to get function declarations and then link against the library. Random numbers can be generated on the device or on the host CPU. For device generation, calls to the library happen on the host, but the actual work of random number generation occurs on the device. The resulting random numbers are stored in global memory on the device. Users can then call their own kernels to use the random numbers, or they can copy the random numbers back to the host for further processing. For host CPU generation, all of the work is done on the host, and the random numbers are stored in host memory.

The second piece of cuRAND is the device header file, `/include/curand_kernel.h`. This file defines device functions for setting up random number generator states and generating sequences of random numbers. User code may include this header file, and user-written kernels may then call the device functions defined in the header file. This allows random numbers to be generated and immediately consumed by user kernels without requiring the random numbers to be written to and then read from global memory.

Note: The new cuRAND Device Extensions (**cuRANDDx**) library, a part of the **MathDx** package, provides more performant and tunable random number generations to be conducted inside CUDA kernels. Users of the legacy cuRAND device API are encouraged to migrate to cuRANDDx to take advantage of these improvements. See Device API Overview for more details.

Chapter 2. Compatibility and Versioning

The host API of cuRAND is intended to be backward compatible at the source level with future releases (unless stated otherwise in the release notes of a specific future release). In other words, if a program uses cuRAND, it should continue to compile and work correctly with newer versions of cuRAND without source code changes.

cuRAND is not guaranteed to be backward compatible at the binary level. Using different versions of the `curand.h` header file and the shared library is not supported. Using different versions of cuRAND and the CUDA runtime is not supported.

The device API should be backward compatible at the source level for public functions in most cases.

Chapter 3. Host API Overview

To use the host API, user code should include the library header file `curand.h` and dynamically link against the cuRAND library. The library uses the CUDA runtime, thus when using the static cuRAND library user needs to link against CUDA Runtime too.

Random numbers are produced by generators. A generator in cuRAND encapsulates all the internal state necessary to produce a sequence of pseudorandom or quasirandom numbers. The normal sequence of operations is as follows:

1. Create a new generator of the desired type (see [Generator Types](#)) with `curandCreateGenerator()`.
2. Set the generator options (see [Generator Options](#)); for example, use `curandSetPseudoRandomGeneratorSeed()` to set the seed.
3. Allocate memory on the device with `cudaMalloc()`.
4. Generate random numbers with `curandGenerate()` or another generation function.
5. Use the results.
6. If desired, generate more random numbers with more calls to `curandGenerate()`.
7. Clean up with `curandDestroyGenerator()`.

To generate random numbers on the host CPU, in step one above call `curandCreateGeneratorHost()`, and in step three, allocate a host memory buffer to receive the results. All other calls work identically whether you are generating random numbers on the device or on the host CPU.

It is legal to create several generators at the same time. Each generator encapsulates a separate state and is independent of all other generators. The sequence of numbers produced by each generator is deterministic. Given the same set-up parameters, the same sequence will be generated with every run of the program. Generating random numbers on the device will result in the same sequence as generating them on the host CPU.

Note that `curandGenerate()` in step 4 above launches a kernel and returns asynchronously. If you launch another kernel in a different stream, and that kernel needs to use the results of `curandGenerate()`, you must either call `cudaDeviceSynchronize()` or use the stream management/event management routines, to ensure that the random generation kernel has finished execution before the new kernel is launched.

Note that it is not valid to pass a host memory pointer to a generator that is running on the device, and it is not valid to pass a device memory pointer to a generator that is running on the CPU. Behavior in these cases is undefined.

3.1. Generator Types

Random number generators are created by passing a type to `curandCreateGenerator()`. There are nine types of random number generators in cuRAND, that fall into two categories. `CURAND_RNG_PSEUDO_XORWOW`, `CURAND_RNG_PSEUDO_MRG32K3A`, `CURAND_RNG_PSEUDO_MTGP32`, `CURAND_RNG_PSEUDO_PHILOX4_32_10` and `CURAND_RNG_PSEUDO_MT19937` are pseudorandom number generators. `CURAND_RNG_PSEUDO_XORWOW` is implemented using the XORWOW algorithm, a member of the xor-shift family of pseudorandom number generators. `CURAND_RNG_PSEUDO_MRG32K3A` is a member of the Combined Multiple Recursive family of pseudorandom number generators. `CURAND_RNG_PSEUDO_MT19937` and `CURAND_RNG_PSEUDO_MTGP32` are members of the Mersenne Twister family of pseudorandom number generators. `CURAND_RNG_PSEUDO_MTGP32` has parameters customized for operation on the GPU. `CURAND_RNG_PSEUDO_MT19937` has the same parameters as CPU version, but ordering is different. `CURAND_RNG_PSEUDO_MT19937` supports only HOST API and can be used only on architecture sm_35 or higher. `CURAND_RNG_PHILOX4_32_10` is a member of Philox family, which is one of the three non-cryptographic Counter Based Random Number Generators presented on SC11 conference by D E Shaw Research. There are 4 variants of the basic SOBOL' quasi random number generator. All of the variants generate sequences in up to 20,000 dimensions. `CURAND_RNG_QUASI_SOBOL32`, `CURAND_RNG_QUASI_SCRAMBLED_SOBOL32`, `CURAND_RNG_QUASI_SOBOL64`, and `CURAND_RNG_QUASI_SCRAMBLED_SOBOL64` are quasirandom number generator types. `CURAND_RNG_QUASI_SOBOL32` is a Sobol' generator of 32-bit sequences. `CURAND_RNG_QUASI_SCRAMBLED_SOBOL32` is a scrambled Sobol' generator of 32-bit sequences. `CURAND_RNG_QUASI_SOBOL64` is a Sobol' generator of 64-bit sequences. `CURAND_RNG_QUASI_SCRAMBLED_SOBOL64` is a scrambled Sobol' generator of 64-bit sequences.

3.2. Generator Options

Once created, random number generators can be defined using the general options seed, offset, and order.

3.2.1. Seed

The seed parameter is a 64-bit integer that initializes the starting state of a pseudorandom number generator. The same seed always produces the same sequence of results.

3.2.2. Offset

The offset parameter is used to skip ahead in the sequence. If offset = 100, the first random number generated will be the 100th in the sequence. This allows multiple runs of the same program to continue generating results from the same sequence without overlap. Note that the skip ahead function is not available for the `CURAND_RNG_PSEUDO_MTGP32` and `CURAND_RNG_PSEUDO_MT19937` generators.

3.2.3. Order

The order parameter is used to choose how the results are ordered in global memory. It also has direct influence on performance of cuRAND generation functions.

There are five ordering choices for pseudorandom sequences: `CURAND_ORDERING_PSEUDO_DEFAULT`, `CURAND_ORDERING_PSEUDO_LEGACY`, `CURAND_ORDERING_PSEUDO_BEST`, `CURAND_ORDERING_PSEUDO_SEEDED`, and `CURAND_ORDERING_PSEUDO_DYNAMIC`. There is one ordering choice for quasirandom numbers, `CURAND_ORDERING_QUASI_DEFAULT`. The default ordering for pseudorandom number generators is `CURAND_ORDERING_PSEUDO_DEFAULT`, while the default ordering for quasirandom number generators is `CURAND_ORDERING_QUASI_DEFAULT`.

The two pseudorandom orderings `CURAND_ORDERING_PSEUDO_DEFAULT` and `CURAND_ORDERING_PSEUDO_BEST` produce the same output ordering for all pseudo-random generators, except MT19937 for which `CURAND_ORDERING_PSEUDO_DEFAULT` is the same as `CURAND_ORDERING_PSEUDO_LEGACY`. For MT19937 `CURAND_ORDERING_PSEUDO_BEST` may generate different output on different models of GPUs, and it can't be used with a host generator created using `curandCreateGeneratorHost()`. Future releases of cuRAND may change the ordering associated with `CURAND_ORDERING_PSEUDO_BEST` to improve either performance or the quality of the results. It will always be the case that the ordering obtained with `CURAND_ORDERING_PSEUDO_BEST` is deterministic and is the same for each run of the program. The ordering obtained with `CURAND_ORDERING_PSEUDO_LEGACY` is guaranteed to remain the same for all cuRAND releases.

The `CURAND_ORDERING_PSEUDO_DYNAMIC` ordering can't be used with a host generator created using `curandCreateGeneratorHost()`, and it is currently only supported with the following pseudo-random generators: `CURAND_RNG_PSEUDO_XORWOW`, `CURAND_RNG_PSEUDO_PHILOX4_32_10`, `CURAND_RNG_PSEUDO_MRG32K3A`, and `CURAND_RNG_PSEUDO_MTGP32`. When `CURAND_ORDERING_PSEUDO_DYNAMIC` ordering is selected cuRAND tries to maximize GPU utilization to deliver the best performance. The ordering obtained with `CURAND_ORDERING_PSEUDO_DYNAMIC` can be different on different GPUs. It is not guaranteed to: remain the same for all cuRAND releases, and be the same for all distributions. It is guaranteed to be deterministic.

The differences in behavior of the ordering parameters for each generator type are outlined below:

- XORWOW pseudorandom generator
 - `CURAND_ORDERING_PSEUDO_DEFAULT`

The output ordering of `CURAND_ORDERING_PSEUDO_DEFAULT` is the same as `CURAND_ORDERING_PSEUDO_BEST` in the current release.
 - `CURAND_ORDERING_PSEUDO_BEST`

The output ordering of `CURAND_ORDERING_PSEUDO_BEST` is the same as `CURAND_ORDERING_PSEUDO_LEGACY` in the current release.
 - `CURAND_ORDERING_PSEUDO_LEGACY`

The result at offset n in global memory is from position

$$(n \bmod 4096) \cdot 2^{67} + \lfloor n/4096 \rfloor$$

in the original XORWOW sequence.
 - `CURAND_ORDERING_PSEUDO_DYNAMIC`

The output ordering of `CURAND_ORDERING_PSEUDO_DYNAMIC` can be different on different GPUs.
 - `CURAND_ORDERING_PSEUDO_SEEDED`

The result at offset n in global memory is from position $n/4096$ in the XORWOW sequence seeded with a combination of the user seed and the number $n \bmod 4096$. In other words, each of 4096 threads uses a different seed. This seeding method reduces state setup time but may result in statistical weaknesses of the pseudorandom output for some user seed values.

► MRG32k3a pseudorandom generator

► CURAND_ORDERING_PSEUDO_DEFAULT

The output ordering of CURAND_ORDERING_PSEUDO_DEFAULT is the same as CURAND_ORDERING_PSEUDO_BEST in the current release.

► CURAND_ORDERING_PSEUDO_BEST

The result at offset n in global memory is from position

$$(n \bmod 81920) \cdot 2^{76} + \lfloor n/81920 \rfloor$$

in the original MRG32k3a sequence. (Note that the stride between subsequent samples for MRG32k3a is not the same as for XORWOW)

► CURAND_ORDERING_PSEUDO_LEGACY

The result at offset n in global memory is from position

$$(n \bmod 4096) \cdot 2^{76} + \lfloor n/4096 \rfloor$$

in the original MRG32k3a sequence. (Note that the stride between subsequent samples for MRG32k3a is not the same as for XORWOW)

► CURAND_ORDERING_PSEUDO_DYNAMIC

The output ordering of CURAND_ORDERING_PSEUDO_DYNAMIC can be different on different GPUs.

► MTGP32 pseudorandom generator

► CURAND_ORDERING_PSEUDO_DEFAULT

The output ordering of CURAND_ORDERING_PSEUDO_DEFAULT is the same as CURAND_ORDERING_PSEUDO_BEST in the current release.

► CURAND_ORDERING_PSEUDO_BEST

The MTGP32 generator actually generates 192 distinct sequences based on different parameter sets for the basic algorithm. Let $S(p)$ be the sequence for parameter set p .

The result at offset n in global memory is from position $n \bmod 256$ from the sequence

$$S(\lfloor n/256 \rfloor \bmod 192)$$

In other words 256 samples from $S(0)$ are followed by 256 samples from $S(1)$ and so-on, up to $S(191)$. This pattern repeats, so the subsequent 256 samples are from $S(0)$, followed by 256 samples from $S(1)$, and so on.

► CURAND_ORDERING_PSEUDO_LEGACY

The MTGP32 generator actually generates 64 distinct sequences based on different parameter sets for the basic algorithm. Let $S(p)$ be the sequence for parameter set p .

The result at offset n in global memory is from position $n \bmod 256$ from the sequence

$$S(\lfloor n/256 \rfloor \bmod 64)$$

In other words 256 samples from $S(0)$ are followed by 256 samples from $S(1)$ and so-on, up to $S(63)$. This pattern repeats, so the subsequent 256 samples are from $S(0)$, followed by 256 samples from $S(1)$, and so on.

► **CURAND_ORDERING_PSEUDO_DYNAMIC**

The output ordering of **CURAND_ORDERING_PSEUDO_DYNAMIC** can be different on different GPUs. In this ordering MTGP32 can use different precalculated parameters than original MTGP32 implementation.

► **MT19937 pseudorandom generator**

► **CURAND_ORDERING_PSEUDO_DEFAULT**

The output ordering of **CURAND_ORDERING_PSEUDO_DEFAULT** is the same as **CURAND_ORDERING_PSEUDO_LEGACY** in the current release.

► **CURAND_ORDERING_PSEUDO_LEGACY**

Ordering is based heavily on the standard MT19937 CPU implementation. Output is generated by 8192 independent generators. Each generator generates consecutive subsequence of the original sequence. Length of each subsequence is 2^{1000} . Random numbers are generated by eights thus first 8 elements come from first subsequence, next 8 elements come from second subsequence and so on. Results are permuted differently than originally to achieve higher performance. Ordering is independent of the hardware that you are using. For more information please see [18].

► **CURAND_ORDERING_PSEUDO_BEST**

The output ordering of **CURAND_ORDERING_PSEUDO_BEST** to achieve better performance depends on number of SMs that composed your GPU. Random numbers are generated in the same way as with **CURAND_ORDERING_PSEUDO_LEGACY** but the number of generators may be different to achieve better performance. Generating seeds is much faster using this ordering.

The ordering **CURAND_ORDERING_PSEUDO_BEST** is only supported with GPU cuRAND random number generators and can't be used with a host generator created using `curandCreateGeneratorHost()`.

► **Philox_4x32_10 pseudorandom generator**

► **CURAND_ORDERING_PSEUDO_DEFAULT**

The output ordering of **CURAND_ORDERING_PSEUDO_DEFAULT** is the same as **CURAND_ORDERING_PSEUDO_BEST** in the current release.

► **CURAND_ORDERING_PSEUDO_BEST**

The output ordering of **CURAND_ORDERING_PSEUDO_BEST** is the same as **CURAND_ORDERING_PSEUDO_LEGACY** in the current release.

► **CURAND_ORDERING_PSEUDO_LEGACY**

Each thread in **Philox_4x32_10** generator generates distinct sequences based on different parameter sets for the basic algorithm. In host API there are 65536 different sequences. Each four values from one sequence are followed by four values from next sequence.

► **CURAND_ORDERING_PSEUDO_DYNAMIC**

The output ordering of **CURAND_ORDERING_PSEUDO_DYNAMIC** can be different on different GPUs.

► **32 and 64 bit SOBOL and Scrambled SOBOL quasirandom generators**

► CURAND_ORDERING_QUASI_DEFAULT

When generating n results in d dimensions, the output will consist of n/d results from dimension 1, followed by n/d results from dimension 2, and so on up to dimension d . Only exact multiples of the dimension size may be generated. The dimension parameter d is set with `curandSetQuasiRandomGeneratorDimensions()` and defaults to 1.

3.3. Return Values

All cuRAND host library calls have a return value of `curandStatus_t`. Calls that succeed without errors return `CURAND_STATUS_SUCCESS`. If errors occur, other values are returned depending on the error. Because CUDA allows kernels to execute asynchronously from CPU code, it is possible that errors in a non-cuRAND kernel will be detected during a call to a library function. In this case, `CURAND_STATUS_PREEXISTING_ERROR` is returned.

3.4. Generation Functions

```
curandStatus_t
curandGenerate(
    curandGenerator_t generator,
    unsigned int *outputPtr, size_t num)

curandStatus_t
curandGenerateLongLong(
    curandGenerator_t generator,
    unsigned long long *outputPtr, size_t num)
```

The `curandGenerate()` function is used to generate pseudo- or quasirandom bits of output for XORWOW, MRG32k3a, MTGP32, MT19937, Philox_4x32_10 and SOBOL32 generators. Each output element is a 32-bit unsigned int where all bits are random. For SOBOL64 generators, each output element is a 64-bit unsigned long long where all bits are random. `curandGenerate()` returns an error for SOBOL64 generators. Use `curandGenerateLongLong()` to generate 64 bit integers with the SOBOL64 generators.

```
curandStatus_t
curandGenerateUniform(
    curandGenerator_t generator,
    float *outputPtr, size_t num)
```

The `curandGenerateUniform()` function is used to generate uniformly distributed floating point values between 0.0 and 1.0, where 0.0 is excluded and 1.0 is included.

```
curandStatus_t
curandGenerateNormal(
    curandGenerator_t generator,
    float *outputPtr, size_t n,
    float mean, float stddev)
```

The `curandGenerateNormal()` function is used to generate normally distributed floating point values with the given mean and standard deviation.

```

curandStatus_t
curandGenerateLogNormal(
    curandGenerator_t generator,
    float *outputPtr, size_t n,
    float mean, float stddev)

```

The `curandGenerateLogNormal()` function is used to generate log-normally distributed floating point values based on a normal distribution with the given mean and standard deviation.

```

curandStatus_t
curandGeneratePoisson(
    curandGenerator_t generator,
    unsigned int *outputPtr, size_t n,
    double lambda)

```

The `curandGeneratePoisson()` function is used to generate Poisson-distributed integer values based on a Poisson distribution with the given lambda.

```

curandStatus_t
curandGenerateUniformDouble(
    curandGenerator_t generator,
    double *outputPtr, size_t num)

```

The `curandGenerateUniformDouble()` function generates uniformly distributed random numbers in double precision.

```

curandStatus_t
curandGenerateNormalDouble(
    curandGenerator_t generator,
    double *outputPtr, size_t n,
    double mean, double stddev)

```

`curandGenerateNormalDouble()` generates normally distributed results in double precision with the given mean and standard deviation. Double precision results can only be generated on devices of compute capability 1.3 or above, and the host.

```

curandStatus_t
curandGenerateLogNormalDouble(
    curandGenerator_t generator,
    double *outputPtr, size_t n,
    double mean, double stddev)

```

`curandGenerateLogNormalDouble()` generates log-normally distributed results in double precision, based on a normal distribution with the given mean and standard deviation.

For quasirandom generation, the number of results returned must be a multiple of the dimension of the generator.

Generation functions can be called multiple times on the same generator to generate successive blocks of results. For pseudorandom generators, multiple calls to generation functions will yield the same result as a single call with a large size. For quasirandom generators, because of the ordering of dimensions in memory, many shorter calls will not produce the same results in memory as one larger call; however the generated n -dimensional vectors will be the same.

Double precision results can only be generated on devices of compute capability 1.3 or above, and the host.

3.5. Host API Example

```

/*
 * This program uses the host CURAND API to generate 100
 * pseudorandom floats.
 */
#include <stdio.h>
#include <stdlib.h>
#include <cuda_runtime.h>
#include <curand.h>

#define CUDA_CALL(x) do { if((x)!=cudaSuccess) { \
    printf("Error at %s:%d\n", __FILE__, __LINE__); \
    return EXIT_FAILURE;}} while(0)
#define CURAND_CALL(x) do { if((x)!=CURAND_STATUS_SUCCESS) { \
    printf("Error at %s:%d\n", __FILE__, __LINE__); \
    return EXIT_FAILURE;}} while(0)

int main(int argc, char *argv[])
{
    size_t n = 100;
    size_t i;
    curandGenerator_t gen;
    float *devData, *hostData;

    /* Allocate n floats on host */
    hostData = (float *)calloc(n, sizeof(float));

    /* Allocate n floats on device */
    CUDA_CALL(cudaMalloc((void **)&devData, n*sizeof(float)));

    /* Create pseudo-random number generator */
    CURAND_CALL(curandCreateGenerator(&gen,
        CURAND_RNG_PSEUDO_DEFAULT));

    /* Set seed */
    CURAND_CALL(curandSetPseudoRandomGeneratorSeed(gen,
        1234ULL));

    /* Generate n floats on device */
    CURAND_CALL(curandGenerateUniform(gen, devData, n));

    /* Copy device memory to host */
    CUDA_CALL(cudaMemcpy(hostData, devData, n * sizeof(float),
        cudaMemcpyDeviceToHost));

    /* Show result */
    for(i = 0; i < n; i++) {
        printf("%1.4f ", hostData[i]);
    }
    printf("\n");

    /* Cleanup */
    CURAND_CALL(curandDestroyGenerator(gen));
    CUDA_CALL(cudaFree(devData));
    free(hostData);
}

```

(continues on next page)

(continued from previous page)

```

    return EXIT_SUCCESS;
}

```

3.6. Static Library support

Starting with release 6.5, the cuRAND Library is also delivered in a static form as `libcurand_static.a` on Linux and Mac. Static libraries are not supported on Windows. The static cuRAND library depends on a common thread abstraction layer library called `libcuos.a` on Linux and Mac and `cuos.lib` on Windows.

For example, on linux, to compile a small application using cuRAND against the dynamic library, the following command can be used:

```
nvcc myCurandApp.c -lcurand -o myCurandApp
```

Whereas to compile against the static cuRAND library, the following command has to be used:

```
nvcc myCurandApp.c -lcurand_static -lcuilibos -o myCurandApp
```

It is also possible to use the native Host C++ compiler. Depending on the Host Operating system, some additional libraries like `pthread` or `d1` might be needed on the linking line. The following command on Linux is suggested :

```
g++ myCurandApp.c -lcurand_static -lcuilibos -lcudart_static -lpthread -ld1 -I
-><cuda-toolkit-path>/include -L <cuda-toolkit-path>/lib64 -o myCurandApp
```

Note that in the latter case, the library `cuda` is not needed. The CUDA Runtime will try to open explicitly the `cuda` library if needed. In the case of a system which does not have the CUDA driver installed, this allows the application to gracefully manage this issue and potentially run if a CPU-only path is available.

3.7. Performance Notes

In general you will get the best performance from the cuRAND library by generating blocks of random numbers that are as large as possible. Fewer calls to generate many random numbers is more efficient than many calls generating only a few random numbers. The default pseudorandom generator, XORWOW, with the default ordering takes some time to setup the first time it is called. Subsequent generation calls do not require this setup. To avoid this setup time, use the `CURAND_ORDERING_PSEUDO_SEEDED` ordering.

The MTGP32 Mersenne Twister algorithm is closely tied to the thread and block count. The state structure for MTGP32 actually contains the state for 256 consecutive samples from a given sequence, as determined by a specific parameter set. Each of 64 blocks uses a different parameter set and each of 256 threads generates one sample from the state, and updates the state. Hence the most efficient use of MTGP32 is to generate a multiple of 16384 samples.

The MT19937 algorithm performance depends on number of samples generated during the single call. Peak performance can be achieved while generating more than 2GB of data, but 80% of peak performance can be achieved while generating only 80MB. Please see [18] for reference.

The Philox_4x32_10 algorithm is closely tied to the thread and block count. Each thread computes 4 random numbers in the same time thus the most efficient use of Philox_4x32_10 is to generate a multiple of 4 times number of threads.

To get the best performance for cuRAND host APIs users are encouraged to use CURAND_ORDERING_PSEUDO_BEST or CURAND_ORDERING_PSEUDO_DYNAMIC orderings.

3.8. Thread Safety

cuRAND host APIs are thread safe as long as different host threads use different generators, generators are not MT19937 (CURAND_RNG_PSEUDO_MT19937), and the outputs are disjoint.

Please note that cuRAND host APIs are not thread safe when used with MT19937 generators (CURAND_RNG_PSEUDO_MT19937).

Chapter 4. Device API Overview

Note: The new cuRAND Device Extensions ([cuRANDDx](#)) library is a device side API extension for generating random numbers inside CUDA kernels. By fusing random number generations with other numerical operations, you can achieve better performance for your application and lower latency.

- ▶ You can access the cuRANDDx documentation here: [cuRANDDx documentation](#).
- ▶ cuRANDDx is not a part of the CUDA Toolkit. cuRANDDx is a part of the MathDx package and can be downloaded from here: [cuRANDDx downloads](#).

Warning: The legacy cuRAND device API will be deprecated in a future release.

Note that in this section, all references to the “cuRAND device API” refer to the legacy cuRAND device API. cuRANDDx is not covered in this section.

To use the device API, include the file `curand_kernel.h` in files that define kernels that use cuRAND device functions. The device API includes functions [pseudorandom generation](#) for and [quasirandom generation](#).

4.1. Pseudorandom Sequences

The functions for pseudorandom sequences support bit generation and generation from distributions.

4.1.1. Bit Generation with XORWOW and MRG32k3a generators

```
__device__ unsigned int  
curand(curandStateXORWOW_t *state)  
  
__device__ unsigned int  
curand(curandStateMRG32k3a_t *state)
```

Following a call to `curand_init()`, `curand()` returns a sequence of pseudorandom numbers with a period greater than 2^{190} . If `curand()` is called with the same initial state each time, and the state is not modified between the calls to `curand()`, the same sequence is always generated.

```

__device__ void
curand_init(unsigned long long seed,
            unsigned long long sequence,
            unsigned long long offset,
            curandStateXORWOW_t *state)

__device__ void
curand_init(unsigned long long seed,
            unsigned long long sequence,
            unsigned long long offset,
            curandStateMRG32k3a_t *state)

```

The `curand_init()` function sets up an initial state allocated by the caller using the given seed, sequence number, and offset within the sequence. Different seeds are guaranteed to produce different starting states and different sequences. The same seed always produces the same state and the same sequence. The state set up will be the state after 2^{67} `sequence + offset` calls to `curand()` from the seed state.

Sequences generated with different seeds usually do not have statistically correlated values, but some choices of seeds may give statistically correlated sequences. Sequences generated with the same seed and different sequence numbers will not have statistically correlated values.

For the highest quality parallel pseudorandom number generation, each experiment should be assigned a unique seed. Within an experiment, each thread of computation should be assigned a unique sequence number. If an experiment spans multiple kernel launches, it is recommended that threads between kernel launches be given the same seed, and sequence numbers be assigned in a monotonically increasing way. If the same configuration of threads is launched, random state can be preserved in global memory between launches to avoid state setup time.

4.1.2. Bit Generation with the MTGP32 generator

The MTGP32 generator is an adaptation of code developed at Hiroshima University (see [1]). In this algorithm, samples are generated for multiple sequences, each sequence based on a set of computed parameters. cuRAND uses the 200 parameter sets that have been pre-generated for the 32-bit generator with period 2^{11214} . It would be possible to generate other parameter sets, as described in [1], and use those instead. There is one state structure for each parameter set (sequence), and the algorithm allows thread-safe generation and state update for up to 256 concurrent threads (within a single block) for each of the 200 sequences.

Note that two different blocks can not operate on the same state safely. Also note that, within a block, at most 256 threads may operate on a given state.

For the MTGP32 generator, two host functions are provided to help set up parameters for the different sequences in device memory, and to set up the initial state.

```

__host__ curandStatust curandMakeMTGP32Constants(mtg32paramsfastt params[],
                                                  mtgp32kernelparamst *p)

```

This function reorganizes the parameter set data from the pre-generated format (`mtgp32_params_fast_t`) into the format used by the kernel functions (`mtgp32_kernel_params_t`), and copies them to device memory.

```

__host__ curandStatus_t
curandMakeMTGP32KernelState(curandStateMtg32_t *s,

```

(continues on next page)

(continued from previous page)

```

    mtgp32_params_fast_t params[],
    mtgp32_kernel_params_t *k,
    int n,
    unsigned long long seed)

```

This function initializes *n* states, based on the specified parameter set and seed, and copies them to device memory indicated by *s*. Note that if you are using the pre-generated states, the maximum value of *n* is 200.

The cuRAND MTGP32 generator provides two kernel functions to generate random bits.

```

__device__ unsigned int
curand(curandStateMtg32_t *state)

```

This function computes a thread index, and for that index generates a result and updates state. The thread index *t* is computed as:

$$t = (\text{blockDim.x} * \text{blockDim.y} * \text{threadIdx.z}) + (\text{blockDim.x} * \text{threadIdx.y}) + \text{threadIdx.x}$$

This function may be called repeatedly from a single kernel launch, with the following constraints:

- ▶ It may only be called safely from a block that has 256 or fewer threads.
- ▶ A given state may not be used by more than one block.
- ▶ A given block may generate randoms using multiple states.
- ▶ At a given point in the code, all threads in the block, or none of them, must call this function.

```

__device__ unsigned int
curandmtgp32specific(curandStateMtg32_t *state, unsigned char index,
                    unsigned char n)

```

This function generates a result and updates state for the position specified by a thread-specific index, and advances the offset in the state by *n* positions. `curand_mtgp32_specific` may be called multiple times within a kernel launch, with the following constraints:

- ▶ At most 256 threads may call this function for a given state.
- ▶ Within a block, for a given state, if *n* threads are calling the function, the indices must run from 0 . . . *n*-1. The indices do not have to match the thread numbers, and may be distributed among the threads as required by the calling program. At a given point in the code, all of the indices from 0 . . . *n*-1, or none of them, must be used.
- ▶ A given state may not be used by more than one block.
- ▶ A given block may generate randoms using multiple states.

Figure 1. MTGP32 Block and Thread Operation

Figure 1 is an illustration of how blocks and threads in MTGP32 operate on the generator states. Each row represents a circular state array of 32-bit integers $s(n)$. Threads operating on the array are identified as $T(m)$. The specific case shown matches the internal implementation of the host API, which launches 64 blocks of 256 threads. Each block operates on a different sequence, determined by a unique set of parameters, $P(n)$. One complete state of an MTGP32 sequence is defined by 351 32-bit integers. Each thread $T(m)$ operates on one of these integers, $s(n+m)$ combining it with $s(n+m+1)$ and a pickup element $s(n+m+p)$, where $p \leq 95$. It stores the new state at position $s(n+m+351)$ in the state array. After thread synchronization, the base index n is advanced by the number of threads that have updated the state. To avoid being overwritten, the array itself must be at least $256 + 351$ integers in length. In fact it is sized at 1024 integers for efficiency of indexing.

The limitation on the number of threads in a block, which can operate on a given state array, arises from the need to ensure that state $s(n+351)$ has been updated before it is needed as a pickup state. If there were a thread $T(256)$, it could use $s(n+256+95)$ i.e. $s(n+351)$ before thread zero has updated $s(n+351)$. If an application requires that more than 256 threads in a block invoke an MTGP32 generator function, it must use multiple MTGP32 states, either by using multiple parameter sets, or by using multiple generators with different seeds. Also note that the generator functions synchronize threads at the end of each call, so it is most efficient for 256 threads in a block to invoke the generator.

4.1.3. Bit Generation with Philox_4x32_10 generator

```
__device__ unsigned int  
curand(curandStatePhilox4_32_10_t *state)
```

Following a call to `curand_init()`, `curand()` returns a sequence of pseudorandom numbers with a period 2^{128} . If `curand()` is called with the same initial state each time, and the state is not modified between the calls to `curand()`, the same sequence is always generated.

```
__device__ void  
curand_init(unsigned long long seed,  
            unsigned long long subsequence,  
            unsigned long long offset,  
            curandStatePhilox4_32_10_t *state)
```

The `curand_init()` function sets up an initial state allocated by the caller using the given seed, subsequence and offset. Different seed is guaranteed to produce different starting states and different sequences. Subsequence and offset together define offset in a sequence with period 2^{128} . Offset defines offset in subsequence of length 2^{64} . When last element from subsequence was generated, then the next random number is first element from consecutive subsequence. The same seed always produces the same state and the same sequence.

Sequences generated with different seeds usually do not have statistically correlated values, but some choices of seeds may give statistically correlated sequences.

For the highest quality parallel pseudorandom number generation, each experiment should be assigned a unique seed value. Within an experiment, each thread of computation should be assigned a unique id number. If an experiment spans multiple kernel launches, it is recommended that threads between kernel launches be given the same seed, and id numbers be assigned in a monotonically increasing way. If the same configuration of threads is launched, random state can be preserved in global memory between launches to avoid state setup time.

4.1.4. Distributions

```
__device__ float  
curand_uniform (curandState_t *state)
```

This function returns a sequence of pseudorandom floats uniformly distributed between 0.0 and 1.0. It may return from 0.0 to 1.0, where 1.0 is included and 0.0 is excluded. Distribution functions may use any number of unsigned integer values from a basic generator. The number of values consumed is not guaranteed to be fixed.

```
__device__ float  
curand_normal (curandState_t *state)
```

This function returns a single normally distributed float with mean 0.0 and standard deviation 1.0. This result can be scaled and shifted to produce normally distributed values with any mean and standard deviation.

```
__device__ float  
curand_log_normal (curandState_t *state, float mean, float stddev)
```

This function returns a single log-normally distributed float based on a normal distribution with the given mean and standard deviation.

```
__device__ unsigned int  
curand_poisson (curandState_t *state, double lambda)
```

This function returns a single Poisson-distributed unsigned int based on a Poisson distribution with the given lambda. The algorithm used to derive a Poisson result from a uniformly distributed result varies depending on the value of lambda and the type of generator. Some algorithms draw more than one sample for a single output.

```
__device__ double  
curand_uniform_double (curandState_t *state)
```

```
__device__ double  
curand_normal_double (curandState_t *state)
```

```
__device__ double  
curand_log_normal_double (curandState_t *state, double mean, double stddev)
```

The three functions above are the double precision versions of `curand_uniform()`, `curand_normal()`, and `curand_log_normal()`.

For pseudorandom generators, the double precision functions use multiple calls to `curand()` to generate 53 random bits.

```
__device__ float2  
curand_normal2 (curandState_t *state)
```

```
__device__ float2  
curand_log_normal2 (curandState_t *state)
```

```
__device__ double2  
curand_normal2_double (curandState_t *state)
```

```
__device__ double2  
curand_log_normal2_double (curandState_t *state)
```

The above functions generate two normally or log normally distributed pseudorandom results with each call. Because the underlying implementation uses the Box-Muller transform, this is generally more efficient than generating a single result with each call.

```
__device__ uint4  
curand4 (curandStatePhilox4_32_10_t *state)
```

```
__device__ float4  
curand_uniform4 (curandStatePhilox4_32_10_t *state)
```

```
__device__ float4  
curand_normal4 (curandStatePhilox4_32_10_t *state)
```

```
__device__ float4  
curand_log_normal4 (curandStatePhilox4_32_10_t *state, float mean, float stddev)
```

```
__device__ uint4  
curand_poisson4 (curandStatePhilox4_32_10_t *state, double lambda)
```

```
__device__ uint4
curand_discrete4 (curandStatePhilox4_32_10_t *state, curandDiscreteDistribution_t
↳discrete_distribution)
```

```
__device__ double2
curand_uniform2_double (curandStatePhilox4_32_10_t *state)
```

```
__device__ double2
curand_normal2_double (curandStatePhilox4_32_10_t *state)
```

```
__device__ double2
curand_log_normal2_double (curandStatePhilox4_32_10_t *state, double mean, double
↳stddev)
```

The above functions generate four single precision or two double precision results with each call. Because the underlying implementation uses the Philox generator, this is generally more efficient than generating a single result with each call.

4.2. Quasirandom Sequences

Although the default generator type is pseudorandom numbers from XORWOW, Sobol' sequences based on Sobol' 32-bit integers can be generated using the following functions:

```
__device__ void
curand_init (
    unsigned int *direction_vectors,
    unsigned int offset,
    curandStateSobol32_t *state)
```

```
__device__ void
curand_init (
    unsigned int *direction_vectors,
    unsigned int scramble_c,
    unsigned int offset,
    curandStateScrambledSobol32_t *state)
```

```
__device__ unsigned int
curand (curandStateSobol32_t *state)
```

```
__device__ float
curand_uniform (curandStateSobol32_t *state)
```

```
__device__ float
curand_normal (curandStateSobol32_t *state)
```

```
__device__ float
curand_log_normal (
    curandStateSobol32_t *state,
    float mean,
    float stddev)
```

```
__device__ unsigned int  
curand_poisson (curandStateSobol32_t *state, double lambda)
```

```
__device__ double  
curand_uniform_double (curandStateSobol32_t *state)
```

```
__device__ double  
curand_normal_double (curandStateSobol32_t *state)
```

```
__device__ double  
curand_log_normal_double (  
    curandStateSobol32_t *state,  
    double mean,  
    double stddev)
```

The `curand_init()` function initializes the quasirandom number generator state. There is no seed parameter, only direction vectors and offset. For scrambled Sobol' generators, there is an additional parameter `scramble_c`, which is the initial value of the scrambled sequence. For the `curandStateSobol32_t` type and the `curandStateScrambledSobol32_t` type the direction vectors are an array of 32 unsigned integer values. For the `curandStateSobol64_t` type and the `curandStateScrambledSobol64_t` type the direction vectors are an array of 64 unsigned long long values. Offsets and initial constants for the scrambled sequence are of type unsigned int for 32-bit Sobol' generators. These parameters are of type unsigned long long for 64-bit Sobol' generators. For the `curandStateSobol32_t` type and the `curandStateScrambledSobol32_t` type the sequence is exactly 2^{32} elements long where each element is 32 bits. For the `curandStateSobol64_t` type and the `curandStateScrambledSobol64_t` type the sequence is exactly 2^{64} elements long where each element is 64 bits. Each call to `curand()` returns the next quasirandom element. Calls to `curand_uniform()` return quasirandom floats or doubles from 0.0 to 1.0, where 1.0 is included and 0.0 is excluded. Similarly, calls to `curand_normal()` return normally distributed floats or doubles with mean 0.0 and standard deviation 1.0. Calls to `curand_log_normal()` return log-normally distributed floats or doubles, derived from the normal distribution with the specified mean and standard deviation. All of the generation functions may be called with any type of Sobol' generator.

As an example, generating quasirandom coordinates that fill a unit cube requires keeping track of three quasirandom generators. All three would start at `offset = 0` and would have dimensions 0, 1, and 2, respectively. A single call to `curand_uniform()` for each generator state would generate the x , y , and z coordinates. Tables of direction vectors are accessible on the host through the `curandGetDirectionVectors32()` and `curandGetDirectionVectors64()` functions. The direction vectors needed should be copied into device memory before use.

The normal distribution functions for quasirandom generation use the inverse cumulative density function to preserve the dimensionality of the quasirandom sequence. Therefore there are no functions that generate more than one result at a time as there are with the pseudorandom generators.

The double precision Sobol32 functions return results in double precision that use 32 bits of internal precision from the underlying generator.

The double precision Sobol64 functions return results in double precision that use 53 bits of internal precision from the underlying generator. These bits are taken from the high order 53 bits of the 64 bit samples.

4.3. Skip-Ahead

There are several functions to skip ahead from a generator state.

```
__device__ void
skipahead(unsigned long long n, curandState_t *state)
```

```
__device__ void
skipahead(unsigned int n, curandStateSobol32_t *state)
```

Using this function is equivalent to calling `curand()` n times without using the return value, but it is much faster.

```
__device__ void
skipahead_sequence(unsigned long long n, curandState_t *state)
```

This function is the equivalent of calling `curand()` $n \cdot 2^{67}$ times without using the return value and is much faster.

4.4. Device API for discrete distributions

Discrete distributions, such as the Poisson distribution, require additional API's that perform preprocessing on HOST side to generate a histogram for the specific distribution. In the case of the Poisson distribution this histogram is different for different values of lambda. Best performance for these distributions will be seen on GPUs with at least 48KB of L1 cache.

```
curandStatus_t
curandCreatePoissonDistribution(
    double lambda,
    curandDiscreteDistribution_t *discrete_distribution)
```

The `curandCreatePoissonDistribution()` function is used to create a histogram for the Poisson distribution with the given lambda.

```
__device__ unsigned int
curand_discrete (
    curandState_t *state,
    curandDiscreteDistribution_t discrete_distribution)
```

This function returns a single discrete distributed unsigned int based on a distribution for the given discrete distribution histogram.

```
curandStatus_t
curandDestroyDistribution(
    curandDiscreteDistribution_t discrete_distribution)
```

The `curandDestroyDistribution()` function is used to clean up structures related to the histogram.

4.5. Performance Notes

Calls to `curand_init()` are slower than calls to `curand()` or `curand_uniform()`. Large offsets to `curand_init()` take more time than smaller offsets. It is much faster to save and restore random generator state than to recalculate the starting state repeatedly.

As shown below, generator state can be stored in global memory between kernel launches, used in local memory for fast generation, and then stored back into global memory.

```
__global__ void example(curandState *global_state)
{
    curandState local_state;
    local_state = global_state[threadIdx.x];
    for(int i = 0; i < 10000; i++) {
        unsigned int x = curand(&local_state);
        ...
    }
    global_state[threadIdx.x] = local_state;
}
```

Initialization of the random generator state generally requires more registers and local memory than random number generation. It may be beneficial to separate calls to `curand_init()` and `curand()` into separate kernels for maximum performance.

State setup can be an expensive operation. One way to speed up the setup is to use different seeds for each thread and a constant sequence number of 0. This can be especially helpful if many generators need to be created. While faster to set up, this method provides less guarantees about the mathematical properties of the generated sequences. If there happens to be a bad interaction between the hash function that initializes the generator state from the seed and the periodicity of the generators, there might be threads with highly correlated outputs for some seed values. We do not know of any problem values; if they do exist they are likely to be rare.

4.6. Device API Examples

This example uses the cuRAND device API to generate pseudorandom numbers using either the XOR-WOW or MRG32k3a generators. For integers, it calculates the proportion that have the low bit set. For uniformly distributed real numbers, it calculates the proportion that are greater than 0.5. For normally distributed real numbers, it calculates the proportion that are within one standard deviation of the mean.

```
/*
 * This program uses the device CURAND API to calculate what
 * proportion of pseudo-random ints have low bit set.
 * It then generates uniform results to calculate how many
 * are greater than .5.
 * It then generates normal results to calculate how many
 * are within one standard deviation of the mean.
 */
#include <stdio.h>
#include <stdlib.h>

#include <cuda_runtime.h>
```

(continues on next page)

(continued from previous page)

```

#include <curand_kernel.h>

#define CUDA_CALL(x) do { if((x) != cudaSuccess) { \
    printf("Error at %s:%d\n", __FILE__, __LINE__); \
    return EXIT_FAILURE;}} while(0)

__global__ void setup_kernel(curandState *state)
{
    int id = threadIdx.x + blockIdx.x * blockDim.x;
    /* Each thread gets same seed, a different sequence
       number, no offset */

4.7. Thrust and cuRAND Example

The following example demonstrates mixing cuRAND and Thrust. It is a minimally modified version of `monte_carlo.cu`, one of the standard Thrust examples. The example estimates π by randomly picking points in the unit square and calculating the distance to the origin to see if the points are in the quarter unit circle.

```
#include <thrust/iterator/counting_iterator.h>
#include <thrust/functional.h>
#include <thrust/transform_reduce.h>
#include <curand_kernel.h>

#include <iostream>
#include <iomanip>

// we could vary M & N to find the perf sweet spot

struct estimate_pi :
    public thrust::unary_function<unsigned int, float>
{
    __device__
    float operator()(unsigned int thread_id)
    {
        float sum = 0;
        unsigned int N = 10000; // samples per thread

        unsigned int seed = thread_id;

        curandState s;

        // seed a random number generator
        curand_init(seed, 0, 0, &s);

        // take N samples in a quarter circle
        for(unsigned int i = 0; i < N; ++i)
        {
            // draw a sample from the unit square
            float x = curand_uniform(&s);
            float y = curand_uniform(&s);

            // measure distance from the origin
            float dist = sqrtf(x*x + y*y);

            // add 1.0f if (u0,u1) is inside the quarter circle
            if(dist <= 1.0f)
                sum += 1.0f;
        }

        // multiply by 4 to get the area of the whole circle
        sum *= 4.0f;

        // divide by N
        return sum / N;
    }
};
```

(continues on next page)

(continued from previous page)

```

int main(void)
{
    // use 30K independent seeds
    int M = 30000;

    float estimate = thrust::transform_reduce(
        thrust::counting_iterator<int>(0),
        thrust::counting_iterator<int>(M),
        estimate_pi(),
        0.0f,
        thrust::plus<float>());
    estimate /= M;

    std::cout << std::setprecision(3);
    std::cout << "pi is approximately ";
    std::cout << estimate << std::endl;
    return 0;
}

```

4.8. Poisson API Example

This example shows the differences between the 3 API types for the Poisson distribution. It is a simulation of queues in a store. The host API is the most robust for generating large vectors of Poisson-distributed random numbers. (i.e. it has the best statistical properties across the full range of lambda values) The discrete Device API is almost as robust as the HOST API and allows Poisson-distributed random numbers to be generated inside a kernel. The simple Device API is the least robust but is more efficient when generating Poisson-distributed random numbers for many different lambdas.

```

/*
 * This program uses CURAND library for Poisson distribution
 * to simulate queues in store for 16 hours. It shows the
 * difference of using 3 different APIs:
 * - HOST API -arrival of customers is described by Poisson(4)
 * - SIMPLE DEVICE API -arrival of customers is described by
 *   Poisson(4*(sin(x/100)+1)), where x is number of minutes
 *   from store opening time.
 * - ROBUST DEVICE API -arrival of customers is described by:
 *   - Poisson(2) for first 3 hours.
 *   - Poisson(1) for second 3 hours.
 *   - Poisson(3) after 6 hours.
 */

Chapter 5. Testing

The XORWOW generator was proposed by Marsaglia [5] and has been tested using the TestU01 “Crush” framework of tests [6]. The full suite of NIST pseudorandomness tests [7] has also been run, though the focus has been on TestU01. The most rigorous the the TestU01 batteries is “BigCrush”, which executes 106 statistical tests over the course of approximately 5 hours on a high-end CPU/GPU. The XORWOW generator passes all of the tests on most runs, but does produce occasional suspect statistics. Below is an example of the summary output from a run that did not pass all tests, with the detail of the specific failure.

```
===== Summary results of BigCrush =====

Version:          TestU01 1.2.3
Generator:        curandXORWOW
Number of statistics: 160
Total CPU time:   05:17:59.63
The following tests gave p-values outside [0.001, 0.9990]:
(eps means a value < 1.0e-300):
(eps1 means a value < 1.0e-15):

      Test                                p-value
-----
81  LinearComp, r = 29                    1 - 7.1e-11
-----
All other tests were passed

Detail from test 81:

scomp_LinearComp test:
-----
    N = 1,  n = 400020,  r = 29,    s = 1

-----
Number of degrees of freedom           : 12
Chi2 statistic for size of jumps       : 7.11
p-value of test                        : 0.85

-----
Normal statistic for number of jumps   : -6.41
p-value of test                        : 1 - 7.1e-11      *****
```

To put this into perspective, there is a table in [6] that gives the results of running various levels of the “Crush” tests on a broad selection of generators. Only a small number of generators pass all of the

BigCrush tests. For example the widely-respected Mersenne twister [8] consistently fails two of the linear complexity tests.

The MRG32k3a generator was proposed in [9], with a specific implementation suggested in [10]. This generator passes all “BigCrush” tests frequently, with occasional marginal results similar to those shown below.

```

===== Summary results of BigCrush =====

All tests were passed

Sobol' sequences are generated using the direction vectors recommended by Joe and Kuo [2]. The scrambled Sobol' method is described in [3] and [4].

Testing of the normal distribution, with the each of the generators, has been done using the Pearson chi-squared test [11], [12], the Jarque-Bera test [13], the Kolmogorov-Smirnov test [14], [15], and the Anderson-Darling test [16].

Tests are run over the range +/- 6 standard deviations. Three Pearson tests are run, with cell counts 1000, 100, and 25. The test output has columns labeled PK for Pearson with 1000 cells, PC for Pearson with 100 cells, P25 for Pearson with 25 cells, JB for Jarque-Bera, KS for Kolmogorov-Smirnov, and AD for Anderson-Darling. The rejection criterion for each test is printed below the label.

The following tables are representative of the test output for statistical testing of the normal distribution for XORWOW, MRG32k3a, MTGP32, MT19937, Philox, Sobol' 32-bit, and scrambled Sobol' 32-bit generators. The rows of each table represent the statistical results computed over successive sequences of 10000 samples.

Testing of the Poisson-distribution, with the each of the generators, has been done using the Pearson chi-squared test [11].

Tests are run over a broad range of lambda values, and the statistics are compared to those for Poisson distribution results using MKL.

__device__ void curand_init(curandDirectionVectors64_t direction_vectors, unsigned long long
    scramble_c, unsigned long long offset, curandStateScrambledSobol64_t *state)
    Initialize Scrambled Sobol64 state.

__device__ void curand_init(curandDirectionVectors64_t direction_vectors, unsigned long long off-
    set, curandStateSobol64_t *state)
    Initialize Sobol64 state.

__device__ void curand_init(curandDirectionVectors32_t direction_vectors, unsigned int offset, cu-
    randStateSobol32_t *state)
    Initialize Sobol32 state.

```

__device__ void *curand_init*(unsigned long long seed, unsigned long long subsequence, unsigned long long offset, curandStateXORWOW_t *state)
Initialize XORWOW state.

__device__ void *curand_init*(unsigned long long seed, unsigned long long subsequence, unsigned long long offset, curandStatePhilox4_32_10_t *state)
Initialize Philox4_32_10 state.

__device__ void *curand_init*(unsigned long long seed, unsigned long long subsequence, unsigned long long offset, curandStateMRG32k3a_t *state)
Initialize MRG32k3a state.

__device__ void *curand_init*(curandDirectionVectors32_t direction_vectors, unsigned int scramble_c, unsigned int offset, curandStateScrambledSobol32_t *state)
Initialize Scrambled Sobol32 state.

__device__ float *curand_log_normal*(curandStateXORWOW_t *state, float mean, float stddev)
Return a log-normally distributed float from an XORWOW generator.

__device__ float *curand_log_normal*(curandStateScrambledSobol32_t *state, float mean, float stddev)
Return a log-normally distributed float from a scrambled Sobol32 generator.

__device__ float *curand_log_normal*(curandStatePhilox4_32_10_t *state, float mean, float stddev)
Return a log-normally distributed float from an Philox4_32_10 generator.

__device__ float *curand_log_normal*(curandStateScrambledSobol64_t *state, float mean, float stddev)
Return a log-normally distributed float from a scrambled Sobol64 generator.

__device__ float *curand_log_normal*(curandStateMtg32_t *state, float mean, float stddev)
Return a log-normally distributed float from an MTGP32 generator.

__device__ float *curand_log_normal*(curandStateSobol64_t *state, float mean, float stddev)
Return a log-normally distributed float from a Sobol64 generator.

__device__ float *curand_log_normal*(curandStateSobol32_t *state, float mean, float stddev)
Return a log-normally distributed float from a Sobol32 generator.

__device__ float *curand_log_normal*(curandStateMRG32k3a_t *state, float mean, float stddev)
Return a log-normally distributed float from an MRG32k3a generator.

__device__ float2 *curand_log_normal2*(curandStateMRG32k3a_t *state, float mean, float stddev)
Return two normally distributed floats from an MRG32k3a generator.

__device__ float2 *curand_log_normal2*(curandStatePhilox4_32_10_t *state, float mean, float stddev)
Return two normally distributed floats from an Philox4_32_10 generator.

__device__ float2 *curand_log_normal2*(curandStateXORWOW_t *state, float mean, float stddev)
Return two normally distributed floats from an XORWOW generator.

__device__ double2 *curand_log_normal2_double*(curandStateMRG32k3a_t *state, double mean, double stddev)
Return two log-normally distributed doubles from an MRG32k3a generator.

__device__ double2 *curand_log_normal2_double*(curandStateXORWOW_t *state, double mean, double stddev)
Return two log-normally distributed doubles from an XORWOW generator.

__device__ double2 *curand_log_normal2_double*(curandStatePhilox4_32_10_t *state, double mean, double stddev)
Return two log-normally distributed doubles from an Philox4_32_10 generator.

__device__ float4 *curand_log_normal4*(curandStatePhilox4_32_10_t *state, float mean, float stddev)
Return four normally distributed floats from an Philox4_32_10 generator.

__NV_SILENCE_DEPRECATION_BEGIN __device__ double4 *curand_log_normal4_double*(curandStatePhilox4_32_10_t *state, double mean, double stddev)

__device__ double *curand_log_normal_double*(curandStateXORWOW_t *state, double mean, double stddev)
Return a log-normally distributed double from an XORWOW generator.

__NV_SILENCE_DEPRECATION_END __device__ double *curand_log_normal_double*(curandStateMRG32k3a_t *state, double mean, double stddev)
Return a log-normally distributed double from an MRG32k3a generator.

__device__ double *curand_log_normal_double*(curandStateMtg32_t *state, double mean, double stddev)
Return a log-normally distributed double from an MTGP32 generator.

__device__ double *curand_log_normal_double*(curandStateSobol32_t *state, double mean, double stddev)
Return a log-normally distributed double from a Sobol32 generator.

__device__ double *curand_log_normal_double*(curandStateScrambledSobol64_t *state, double mean, double stddev)
Return a log-normally distributed double from a scrambled Sobol64 generator.

__device__ double *curand_log_normal_double*(curandStateSobol64_t *state, double mean, double stddev)
Return a log-normally distributed double from a Sobol64 generator.

__device__ double *curand_log_normal_double*(curandStateScrambledSobol32_t *state, double mean, double stddev)
Return a log-normally distributed double from a scrambled Sobol32 generator.

__device__ double *curand_log_normal_double*(curandStatePhilox4_32_10_t *state, double mean, double stddev)
Return a log-normally distributed double from an Philox4_32_10 generator.

__device__ float *curand_mtg32_single*(curandStateMtg32_t *state)
Return a uniformly distributed float from a mtgp32 generator.

__device__ float *curand_mtg32_single_specific*(curandStateMtg32_t *state, unsigned char index, unsigned char n)
Return a uniformly distributed float from a specific position in a mtgp32 generator.

__device__ unsigned int *curand_mtg32_specific*(curandStateMtg32_t *state, unsigned char index, unsigned char n)
Return 32-bits of pseudorandomness from a specific position in a mtgp32 generator.

__device__ float *curand_normal*(curandStateScrambledSobol32_t *state)
Return a normally distributed float from a scrambled Sobol32 generator.

__device__ float *curand_normal*(curandStateScrambledSobol64_t *state)
Return a normally distributed float from a scrambled Sobol64 generator.

__device__ float *curand_normal*(curandStateMRG32k3a_t *state)
Return a normally distributed float from an MRG32k3a generator.

__NV_SILENCE_DEPRECATION_END __device__ float *curand_normal*(curandStateXORWOW_t *state)
Return a normally distributed float from an XORWOW generator.

__device__ float *curand_normal*(curandStateSobol64_t *state)
Return a normally distributed float from a Sobol64 generator.

__device__ float *curand_normal*(curandStateMtg32_t *state)
Return a normally distributed float from a MTGP32 generator.

__device__ float *curand_normal*(curandStatePhilox4_32_10_t *state)
Return a normally distributed float from an Philox4_32_10 generator.

__device__ float *curand_normal*(curandStateSobol32_t *state)
Return a normally distributed float from a Sobol32 generator.

__device__ float2 *curand_normal2*(curandStatePhilox4_32_10_t *state)
Return two normally distributed floats from an Philox4_32_10 generator.

__device__ float2 *curand_normal2*(curandStateXORWOW_t *state)
Return two normally distributed floats from an XORWOW generator.

__device__ float2 *curand_normal2*(curandStateMRG32k3a_t *state)
Return two normally distributed floats from an MRG32k3a generator.

__NV_SILENCE_DEPRECATION_END __device__ double2 *curand_normal2_double*(curandStateMRG32k3a_t *state)
Return two normally distributed doubles from an MRG32k3a generator.

__device__ double2 *curand_normal2_double*(curandStateXORWOW_t *state)
Return two normally distributed doubles from an XORWOW generator.

__device__ double2 *curand_normal2_double*(curandStatePhilox4_32_10_t *state)
Return two normally distributed doubles from an Philox4_32_10 generator.

__device__ float4 *curand_normal4*(curandStatePhilox4_32_10_t *state)
Return four normally distributed floats from an Philox4_32_10 generator.

__NV_SILENCE_DEPRECATION_BEGIN __device__ double4 *curand_normal4_double*(curandStatePhilox4_32_10_t *state)

__device__ double *curand_normal_double*(curandStateSobol64_t *state)
Return a normally distributed double from a Sobol64 generator.

__device__ double *curand_normal_double*(curandStateMRG32k3a_t *state)
Return a normally distributed double from an MRG32k3a generator.

__device__ double *curand_normal_double*(curandStateMtg32_t *state)
Return a normally distributed double from an MTGP32 generator.

__device__ double *curand_normal_double*(curandStateScrambledSobol64_t *state)
Return a normally distributed double from a scrambled Sobol64 generator.

__device__ double *curand_normal_double*(curandStatePhilox4_32_10_t *state)
Return a normally distributed double from an Philox4_32_10 generator.

__device__ double *curand_normal_double*(curandStateScrambledSobol32_t *state)
Return a normally distributed double from a scrambled Sobol32 generator.

__device__ double *curand_normal_double*(curandStateXORWOW_t *state)
Return a normally distributed double from an XORWOW generator.

__device__ double *curand_normal_double*(curandStateSobol32_t *state)
Return a normally distributed double from an Sobol32 generator.

__device__ unsigned int *curand_poisson*(curandStateSobol64_t *state, double lambda)
Return a Poisson-distributed unsigned int from a Sobol64 generator.

__device__ unsigned int *curand_poisson*(curandStateScrambledSobol32_t *state, double lambda)
Return a Poisson-distributed unsigned int from a scrambled Sobol32 generator.

__device__ unsigned int *curand_poisson*(curandStateMtg32_t *state, double lambda)
Return a Poisson-distributed unsigned int from a MTGP32 generator.

__device__ unsigned int *curand_poisson*(curandStateScrambledSobol64_t *state, double lambda)
Return a Poisson-distributed unsigned int from a scrambled Sobol64 generator.

__device__ unsigned int *curand_poisson*(curandStateSobol32_t *state, double lambda)
Return a Poisson-distributed unsigned int from a Sobol32 generator.

__device__ unsigned int *curand_poisson*(curandStatePhilox4_32_10_t *state, double lambda)
Return a Poisson-distributed unsigned int from a Philox4_32_10 generator.

__device__ unsigned int *curand_poisson*(curandStateXORWOW_t *state, double lambda)
Return a Poisson-distributed unsigned int from a XORWOW generator.

__device__ unsigned int *curand_poisson*(curandStateMRG32k3a_t *state, double lambda)
Return a Poisson-distributed unsigned int from a MRG32k3A generator.

__device__ uint4 *curand_poisson4*(curandStatePhilox4_32_10_t *state, double lambda)
Return four Poisson-distributed unsigned ints from a Philox4_32_10 generator.

__device__ unsigned int *curand_poisson_from_normal*(STATE state, double lambda)

__device__ uint4 *curand_poisson_from_normal4*(STATE state, double lambda)

__device__ uint4 *curand_poisson_gammainc4*(T state, float lambda)

__device__ unsigned int *curand_poisson_knuth*(T *state, float lambda)

__device__ uint4 *curand_poisson_knuth4*(T *state, float lambda)

__device__ float *curand_uniform*(curandStateMtg32_t *state)
Return a uniformly distributed float from a MTGP32 generator.

__device__ float *curand_uniform*(curandStateTest_t *state)

__device__ float *curand_uniform*(curandStateSobol32_t *state)
Return a uniformly distributed float from a Sobol32 generator.

__device__ float *curand_uniform*(curandStateScrambledSobol64_t *state)
Return a uniformly distributed float from a scrambled Sobol64 generator.

__NV_SILENCE_DEPRECATED_END __device__ float *curand_uniform*(curandStatePhilox4_32_10_t *state)
Return a uniformly distributed float from a Philox4_32_10 generator.

__device__ float *curand_uniform*(curandStateScrambledSobol32_t *state)
Return a uniformly distributed float from a scrambled Sobol32 generator.

__device__ float *curand_uniform*(curandStateSobol64_t *state)
Return a uniformly distributed float from a Sobol64 generator.

__device__ float *curand_uniform*(curandStateMRG32k3a_t *state)

Return a uniformly distributed float from an MRG32k3a generator.

__device__ float *curand_uniform*(curandStateXORWOW_t *state)

Return a uniformly distributed float from an XORWOW generator.

__device__ double2 *curand_uniform2_double*(curandStatePhilox4_32_10_t *state)

Return a uniformly distributed tuple of 2 doubles from an Philox4_32_10 generator.

__device__ float4 *curand_uniform4*(curandStatePhilox4_32_10_t *state)

Return a uniformly distributed tuple of 4 floats from a Philox4_32_10 generator.

__NV_SILENCE_DEPRECATION_BEGIN __device__ double4 *curand_uniform4_double*(curandStatePhilox4_32_10_t *state)

__device__ double *curand_uniform_double*(curandStateScrambledSobol32_t *state)

Return a uniformly distributed double from a scrambled Sobol32 generator.

__device__ double *curand_uniform_double*(curandStateScrambledSobol64_t *state)

Return a uniformly distributed double from a scrambled Sobol64 generator.

__device__ double *curand_uniform_double*(curandStateMtg32_t *state)

Return a uniformly distributed double from a MTGP32 generator.

__device__ double *curand_uniform_double*(curandStatePhilox4_32_10_t *state)

Return a uniformly distributed double from a Philox4_32_10 generator.

__device__ double *curand_uniform_double*(curandStateMRG32k3a_t *state)

Return a uniformly distributed double from an MRG32k3a generator.

__device__ double *curand_uniform_double*(curandStateTest_t *state)

__device__ double *curand_uniform_double*(curandStateSobol32_t *state)

Return a uniformly distributed double from a Sobol32 generator.

__device__ double *curand_uniform_double*(curandStateSobol64_t *state)

Return a uniformly distributed double from a Sobol64 generator.

__device__ double *curand_uniform_double*(curandStateXORWOW_t *state)

Return a uniformly distributed double from an XORWOW generator.

unsigned int *ini_func1*(unsigned int x)

unsigned int *ini_func2*(unsigned int x)

__host__ int *mtgp32_init_by_array*(unsigned int state[], const mtgp32_params_fast_t *para, unsigned int *array, int length)

__device__ static void **_skipahead_sequence_scratch**(unsigned long long x, *T* *state, unsigned int *scratch)

__device__ static unsigned int **curand**(curandStateXORWOW_t *state)

Return 32-bits of pseudorandomness from an XORWOW generator.

Return 32-bits of pseudorandomness from the XORWOW generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

32-bits of pseudorandomness as an unsigned int, all bits valid to use.

__device__ static unsigned long long **curand**(curandStateSobol64_t *state)

Return 64-bits of quasirandomness from a Sobol64 generator.

Return 64-bits of quasirandomness from the Sobol64 generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

64-bits of quasirandomness as an unsigned long long, all bits valid to use.

__device__ static unsigned long long **curand**(curandStateScrambledSobol64_t *state)

Return 64-bits of quasirandomness from a scrambled Sobol64 generator.

Return 64-bits of quasirandomness from the scrambled Sobol32 generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

64-bits of quasirandomness as an unsigned long long, all bits valid to use.

__device__ static unsigned int **curand**(curandStateTest_t *state)

__device__ static unsigned int **curand**(curandStatePhilox4_32_10_t *state)

Return 32-bits of pseudorandomness from an Philox4_32_10 generator.

Return 32-bits of pseudorandomness from the Philox4_32_10 generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

32-bits of pseudorandomness as an unsigned int, all bits valid to use.

__device__ static unsigned int **curand**(curandStateMRG32k3a_t *state)

Return 32-bits of pseudorandomness from an MRG32k3a generator.

Return 32-bits of pseudorandomness from the MRG32k3a generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

32-bits of pseudorandomness as an unsigned int, all bits valid to use.

__device__ static unsigned int **curand**(curandStateSobol32_t *state)

Return 32-bits of quasirandomness from a Sobol32 generator.

Return 32-bits of quasirandomness from the Sobol32 generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

32-bits of quasirandomness as an unsigned int, all bits valid to use.

__device__ static unsigned int **curand**(curandStateScrambledSobol32_t *state)

Return 32-bits of quasirandomness from a scrambled Sobol32 generator.

Return 32-bits of quasirandomness from the scrambled Sobol32 generator in *state*, increment position of generator by one.

Parameters

state -- Pointer to state to update

Returns

32-bits of quasirandomness as an unsigned int, all bits valid to use.

__device__ static unsigned int **curand**(curandStateMtg32_t *state)

Return 32-bits of pseudorandomness from a mtgp32 generator.

Return 32-bits of pseudorandomness from the mtgp32 generator in *state*, increment position of generator by the number of threads in the block. Note the number of threads in the block can not exceed 256.

Parameters

state -- Pointer to state to update

Returns

32-bits of pseudorandomness as an unsigned int, all bits valid to use.

__device__ static uint4 **curand4**(curandStatePhilox4_32_10_t *state)

Return tuple of 4 32-bit pseudorandoms from a Philox4_32_10 generator.

Return 128 bits of pseudorandomness from the Philox4_32_10 generator in *state*, increment position of generator by four.

Parameters

state -- Pointer to state to update

Returns

128-bits of pseudorandomness as a uint4, all bits valid to use.

__host__ static curandStatus_t **curandMakeMTGP32Constants**(const mtgp32_params_fast_t
params[],
mtgp32_kernel_params_t *p)

Set up constant parameters for the mtgp32 generator.

This host-side helper function re-organizes CURAND_NUM_MTGP32_PARAMS sets of generator parameters for use by kernel functions and copies the result to the specified location in device memory.

Parameters

- ▶ **params** -- Pointer to an array of type `mtgp32_params_fast_t` in host memory
- ▶ **p** -- pointer to a structure of type `mtgp32_kernel_params_t` in device memory.

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if host memory could not be allocated
- ▶ `CURAND_STATUS_INITIALIZATION_FAILED` if the copy to device memory failed
- ▶ `CURAND_STATUS_SUCCESS` otherwise

```
template<typename ParamsType>
__host__ static curandStatus_t curandMakeMTGP32ConstantsImpl(const mtgp32_params_fast_t
                                                                params[], ParamsType *p,
                                                                const int block_num)

__host__ static curandStatus_t curandMakeMTGP32KernelState(curandStateMtg32_t *s,
                                                                mtgp32_params_fast_t
                                                                params[],
                                                                mtgp32_kernel_params_t *k, int
                                                                n, unsigned long long seed)
```

Set up initial states for the mtgp32 generator.

This host-side helper function initializes a number of states (one parameter set per state) for an mtgp32 generator. To accomplish this it allocates a state array in host memory, initializes that array, and copies the result to device memory.

Parameters

- ▶ **s** -- pointer to an array of states in device memory
- ▶ **params** -- Pointer to an array of type `mtgp32_params_fast_t` in host memory
- ▶ **k** -- pointer to a structure of type `mtgp32_kernel_params_t` in device memory
- ▶ **n** -- number of parameter sets/states to initialize
- ▶ **seed** -- seed value

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if host memory state could not be allocated
- ▶ `CURAND_STATUS_INITIALIZATION_FAILED` if the copy to device memory failed
- ▶ `CURAND_STATUS_SUCCESS` otherwise

```
template<typename STATE>
__device__ static unsigned int curand_M2_double(STATE *state, curandDistributionM2Shift_t
                                                                distributionM2)

```

```
__device__ static void curand_init(curandDirectionVectors64_t direction_vectors, unsigned long
                                     long scramble_c, unsigned long long offset,
                                     curandStateScrambledSobol64_t *state)
```

Initialize Scrambled Sobol64 state.

Initialize Sobol64 state in state with the given direction vectors and offset.

The direction vector is a device pointer to an array of 64 unsigned long longs. All input values of offset are legal.

Parameters

- **direction_vectors** -- Pointer to array of 64 unsigned long longs representing the direction vectors for the desired dimension
- **scramble_c** -- Scramble constant
- **offset** -- Absolute offset into sequence
- **state** -- Pointer to state to initialize

```
__device__ static void curand_init(curandDirectionVectors64_t direction_vectors, unsigned long
                                     long offset, curandStateSobol64_t *state)
```

Initialize Sobol64 state.

Initialize Sobol64 state in state with the given direction vectors and offset.

The direction vector is a device pointer to an array of 64 unsigned long longs. All input values of offset are legal.

Parameters

- **direction_vectors** -- Pointer to array of 64 unsigned long longs representing the direction vectors for the desired dimension
- **offset** -- Absolute offset into sequence

- **state** -- Pointer to state to initialize

```
__device__ static void curand_init(curandDirectionVectors32_t direction_vectors, unsigned int  
                                offset, curandStateSobol32_t *state)
```

Initialize Sobol32 state.

Initialize Sobol32 state in `state` with the given `direction_vectors` and `offset`.

The direction vector is a device pointer to an array of 32 unsigned ints. All input values of `offset` are legal.

Parameters

- **direction_vectors** -- Pointer to array of 32 unsigned ints representing the direction vectors for the desired dimension
- **offset** -- Absolute offset into sequence
- **state** -- Pointer to state to initialize

```
__device__ static void curand_init(unsigned long long seed, unsigned long long subsequence,  
                                unsigned long long offset, curandStateXORWOW_t *state)
```

Initialize XORWOW state.

Initialize XORWOW state in `state` with the given `seed`, `subsequence`, and `offset`.

All input values of `seed`, `subsequence`, and `offset` are legal. Large values for `subsequence` and `offset` require more computation and so will take more time to complete.

A value of 0 for `seed` sets the state to the values of the original published version of the xorwow algorithm.

Parameters

- **seed** -- Arbitrary bits to use as a seed
- **subsequence** -- Subsequence to start at
- **offset** -- Absolute offset into sequence
- **state** -- Pointer to state to initialize

```
__device__ static void curand_init(unsigned long long seed, unsigned long long subsequence,  
                                unsigned long long offset, curandStatePhilox4_32_10_t *state)
```

Initialize Philox4_32_10 state.

Initialize Philox4_32_10 state in `state` with the given `seed`, `p\` subsequence, and `offset`.

All input values for `seed`, `subsequence` and `offset` are legal. Each of the possible values of `seed` selects an independent sequence of length . The first . values of the sequence are skipped. I.e., subsequences are of length .

Parameters

- **seed** -- Arbitrary bits to use as a seed
- **subsequence** -- Subsequence to start at
- **offset** -- Absolute offset into subsequence
- **state** -- Pointer to state to initialize

```
__device__ static void curand_init(unsigned long long seed, unsigned long long subsequence,
                                     unsigned long long offset, curandStateMRG32k3a_t *state)
```

Initialize MRG32k3a state.

Initialize MRG32k3a state in `state` with the given `seed`, `subsequence`, and `offset`.

All input values of `seed`, `subsequence`, and `offset` are legal. `subsequence` will be truncated to 51 bits to avoid running into the next sequence

A value of 0 for `seed` sets the state to the values of the original published version of the MRG32k3a algorithm.

Parameters

- **seed** -- Arbitrary bits to use as a seed
- **subsequence** -- Subsequence to start at
- **offset** -- Absolute offset into sequence
- **state** -- Pointer to state to initialize

```
__device__ static void curand_init(curandDirectionVectors32_t direction_vectors, unsigned int
                                     scramble_c, unsigned int offset,
                                     curandStateScrambledSobol32_t *state)
```

Initialize Scrambled Sobol32 state.

Initialize Sobol32 state in `state` with the given `direction_vectors` and `offset`.

The direction vector is a device pointer to an array of 32 unsigned ints. All input values of `offset` are legal.

Parameters

- **direction_vectors** -- Pointer to array of 32 unsigned ints representing the direction vectors for the desired dimension
- **scramble_c** -- Scramble constant
- **offset** -- Absolute offset into sequence
- **state** -- Pointer to state to initialize

```
__device__ static float curand_log_normal(curandStateXORWOW_t *state, float mean, float
                                             stddev)
```

Return a log-normally distributed float from an XORWOW generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the XORWOW generator in `state`, increment position of generator by one.

The implementation uses a Box-Muller transform to generate two normally distributed results, transforms them to log-normal distribution, then returns them one at a time. See `curand_log_normal2()` for a more efficient version that returns both results at once.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution

- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

__device__ static float **curand_log_normal**(curandStateScrambledSobol32_t *state, float mean, float stddev)

Return a log-normally distributed float from a scrambled Sobol32 generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the scrambled Sobol32 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate a normally distributed result, then transforms the result to log-normal.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

__device__ static float **curand_log_normal**(curandStatePhilox4_32_10_t *state, float mean, float stddev)

Return a log-normally distributed float from an Philox4_32_10 generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Philox4_32_10 generator in `state`, increment position of generator by one.

The implementation uses a Box-Muller transform to generate two normally distributed results, transforms them to log-normal distribution, then returns them one at a time. See `curand_log_normal2()` for a more efficient version that returns both results at once.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

__device__ static float **curand_log_normal**(curandStateScrambledSobol64_t *state, float mean, float stddev)

Return a log-normally distributed float from a scrambled Sobol64 generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the scrambled Sobol64 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results, then converts to log-normal distribution.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

```
__device__ static float curand_log_normal(curandStateMtg32_t *state, float mean, float stddev)
```

Return a log-normally distributed float from an MTGP32 generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the MTGP32 generator in `state`, increment position of generator.

The implementation uses the inverse cumulative distribution function to generate a normally distributed result, then transforms the result to log-normal.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

```
__device__ static float curand_log_normal(curandStateSobol64_t *state, float mean, float stddev)
```

Return a log-normally distributed float from a Sobol64 generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Sobol64 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results, then converts to log-normal distribution.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

```
__device__ static float curand_log_normal(curandStateSobol32_t *state, float mean, float stddev)
```

Return a log-normally distributed float from a Sobol32 generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Sobol32 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate a normally distributed result, then transforms the result to log-normal.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

```
__device__ static float curand_log_normal1(curandStateMRG32k3a_t *state, float mean, float stddev)
```

Return a log-normally distributed float from an MRG32k3a generator.

Return a single log-normally distributed float derived from a normal distribution with mean `mean` and standard deviation `stddev` from the MRG32k3a generator in `state`, increment position of generator by one.

The implementation uses a Box-Muller transform to generate two normally distributed results, transforms them to log-normal distribution, then returns them one at a time. See `curand_log_normal2()` for a more efficient version that returns both results at once.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float with mean `mean` and standard deviation `stddev`

```
__device__ static float2 curand_log_normal12(curandStateMRG32k3a_t *state, float mean, float stddev)
```

Return two normally distributed floats from an MRG32k3a generator.

Return two log-normally distributed floats derived from a normal distribution with mean `mean` and standard deviation `stddev` from the MRG32k3a generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results, then transforms them to log-normal.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float2 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__device__ static float2 curand_log_normal12(curandStatePhilox4_32_10_t *state, float mean, float stddev)
```

Return two normally distributed floats from an Philox4_32_10 generator.

Return two log-normally distributed floats derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Philox4_32_10 generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results, then transforms them to log-normal.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float2 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__device__ static float2 curand_log_normal12(curandStateXORWOW_t *state, float mean, float stddev)
```

Return two normally distributed floats from an XORWOW generator.

Return two log-normally distributed floats derived from a normal distribution with mean `mean` and standard deviation `stddev` from the XORWOW generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results, then transforms them to log-normal.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float2 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__device__ static double2 curand_log_normal12_double(curandStateMRG32k3a_t *state, double mean, double stddev)
```

Return two log-normally distributed doubles from an MRG32k3a generator.

Return two log-normally distributed doubles derived from a normal distribution with mean `mean` and standard deviation `stddev` from the MRG32k3a generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results, and transforms them to log-normal distribution,.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double2 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__device__ static double2 curand_log_normal12_double(curandStateXORWOW_t *state, double  
                                                    mean, double stddev)
```

Return two log-normally distributed doubles from an XORWOW generator.

Return two log-normally distributed doubles derived from a normal distribution with mean `mean` and standard deviation `stddev` from the XORWOW generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results, and transforms them to log-normal distribution,.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double2 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__device__ static double2 curand_log_normal12_double(curandStatePhilox4_32_10_t *state,  
                                                    double mean, double stddev)
```

Return two log-normally distributed doubles from an Philox4_32_10 generator.

Return two log-normally distributed doubles derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Philox4_32_10 generator in `state`, increment position of generator by four.

The implementation uses a Box-Muller transform to generate two normally distributed results, and transforms them to log-normal distribution,.

Parameters

- **state** -- Pointer to state to update
- **mean** -- Mean of the related normal distribution
- **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double4 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__device__ static float4 curand_log_normal14(curandStatePhilox4_32_10_t *state, float mean,  
                                              float stddev)
```

Return four normally distributed floats from an Philox4_32_10 generator.

Return four log-normally distributed floats derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Philox4_32_10 generator in `state`, increment position of generator by four.

The implementation uses a Box-Muller transform to generate two normally distributed results, then transforms them to log-normal.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed float4 where each element is from a distribution with mean `mean` and standard deviation `stddev`

```
__NV_SILENCE_DEPRECATION_BEGIN __device__ static double4 curand_log_normal14_double(curandStatePhilox4_32_10_t *state,
                                                                                          double
                                                                                          mean,
                                                                                          double
                                                                                          stddev)
```

```
__device__ static double curand_log_normal1_double(curandStateXORWOW_t *state, double
                                                                                          mean, double stddev)
```

Return a log-normally distributed double from an XORWOW generator.

Return a single normally distributed double derived from a normal distribution with mean `mean` and standard deviation `stddev` from the XORWOW generator in `state`, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results, transforms them to log-normal distribution, then returns them one at a time. See `curand_log_normal2_double()` for a more efficient version that returns both results at once.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean `mean` and standard deviation `stddev`

```
__NV_SILENCE_DEPRECATION_END __device__ static double curand_log_normal_double(curandStateMRG32k3a_t *state,  
                                                                              double  
                                                                              mean,  
                                                                              double  
                                                                              stddev)
```

Return a log-normally distributed double from an MRG32k3a generator.

Return a single normally distributed double derived from a normal distribution with mean `mean` and standard deviation `stddev` from the MRG32k3a generator in `state`, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results, transforms them to log-normal distribution, then returns them one at a time. See `curand_log_normal2_double()` for a more efficient version that returns both results at once.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean `mean` and standard deviation `stddev`

```
__device__ static double curand_log_normal_double(curandStateMtg32_t *state, double mean,  
                                                  double stddev)
```

Return a log-normally distributed double from an MTGP32 generator.

Return a single log-normally distributed double derived from a normal distribution with mean `mean` and standard deviation `stddev` from the MTGP32 generator in `state`, increment position of generator.

The implementation uses the inverse cumulative distribution function to generate normally distributed results, and transforms them into log-normal distribution.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean `mean` and standard deviation `stddev`

```
__device__ static double curand_log_normal_double(curandStateSobol32_t *state, double mean,  
                                                  double stddev)
```

Return a log-normally distributed double from a Sobol32 generator.

Return a single log-normally distributed double derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Sobol32 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results, and transforms them into log-normal distribution.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean **mean** and standard deviation **stddev**

```
__device__ static double curand_log_normal_double(curandStateScrambledSobol64_t *state,  
double mean, double stddev)
```

Return a log-normally distributed double from a scrambled Sobol64 generator.

Return a single normally distributed double derived from a normal distribution with mean **mean** and standard deviation **stddev** from the scrambled Sobol64 generator in **state**, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean **mean** and standard deviation **stddev**

```
__device__ static double curand_log_normal_double(curandStateSobol64_t *state, double mean,  
double stddev)
```

Return a log-normally distributed double from a Sobol64 generator.

Return a single normally distributed double derived from a normal distribution with mean **mean** and standard deviation **stddev** from the Sobol64 generator in **state**, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean **mean** and standard deviation **stddev**

```
__device__ static double curand_log_normal_double(curandStateScrambledSobol32_t *state,  
double mean, double stddev)
```

Return a log-normally distributed double from a scrambled Sobol32 generator.

Return a single log-normally distributed double derived from a normal distribution with mean `mean` and standard deviation `stddev` from the scrambled Sobol32 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results, and transforms them into log-normal distribution.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean `mean` and standard deviation `stddev`

```
__device__ static double curand_log_normal_double(curandStatePhilox4_32_10_t *state, double  
                                                    mean, double stddev)
```

Return a log-normally distributed double from an Philox4_32_10 generator.

Return a single normally distributed double derived from a normal distribution with mean `mean` and standard deviation `stddev` from the Philox4_32_10 generator in `state`, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results, transforms them to log-normal distribution, then returns them one at a time. See `curand_log_normal2_double()` for a more efficient version that returns both results at once.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **mean** -- Mean of the related normal distribution
- ▶ **stddev** -- Standard deviation of the related normal distribution

Returns

Log-normally distributed double with mean `mean` and standard deviation `stddev`

```
__device__ static float curand_mtg32_single(curandStateMtg32_t *state)
```

Return a uniformly distributed float from a mtg32 generator.

Return a uniformly distributed float between `0.0f` and `1.0f` from the mtg32 generator in `state`, increment position of generator. Output range excludes `0.0f` but includes `1.0f`. Denormalized floating point outputs are never returned.

Note: This alternate derivation of a uniform float is provided for completeness with the original source

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between `0.0f` and `1.0f`

```
__device__ static float curand_mtg32_single_specific(curandStateMtg32_t *state, unsigned  
                                                       char index, unsigned char n)
```

Return a uniformly distributed float from a specific position in a mtg32 generator.

Return a uniformly distributed float between 0.0f and 1.0f from position `index` of the `mtgp32` generator in `state`, and increment position of generator by `n` positions, which must be the total number of positions updated in the state by the thread block, for this invocation. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

Note 1: Thread indices must range from 0...`n` - 1. The number of positions updated may not exceed 256. A thread block may update more than one state, but a given state may not be updated by more than one thread block.

Note 2: This alternate derivation of a uniform float is provided for completeness with the original source

Parameters

- **state** -- Pointer to state to update
- **index** -- Index (0..255) of the position within the state to draw from and update
- **n** -- The total number of positions in this state that are being updated by this invocation

Returns

uniformly distributed float between 0.0f and 1.0f

`__device__ static unsigned int curand_mtgp32_specific(curandStateMtg32_t *state, unsigned char index, unsigned char n)`

Return 32-bits of pseudorandomness from a specific position in a `mtgp32` generator.

Return 32-bits of pseudorandomness from position `index` of the `mtgp32` generator in `state`, increment position of generator by `n` positions, which must be the total number of positions updated in the state by the thread block, for this invocation.

Note: Thread indices must range from 0... `n` - 1. The number of positions updated may not exceed 256. A thread block may update more than one state, but a given state may not be updated by more than one thread block.

Parameters

- **state** -- Pointer to state to update
- **index** -- Index (0..255) of the position within the state to draw from and update
- **n** -- The total number of positions in this state that are being updated by this invocation

Returns

32-bits of pseudorandomness as an unsigned int, all bits valid to use.

`__device__ static float curand_normal(curandStateScrambledSobol32_t *state)`

Return a normally distributed float from a scrambled Sobol32 generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the scrambled Sobol32 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float **curand_normal**(curandStateScrambledSobol64_t *state)

Return a normally distributed float from a scrambled Sobol64 generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the scrambled Sobol64 generator in *state*, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float **curand_normal**(curandStateMRG32k3a_t *state)

Return a normally distributed float from an MRG32k3a generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the MRG32k3a generator in *state*, increment position of generator by one.

The implementation uses a Box-Muller transform to generate two normally distributed results, then returns them one at a time. See `curand_normal2()` for a more efficient version that returns both results at once.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__NV_SILENCE_DEPRECATED__ __device__ static float **curand_normal**(curandStateXORWOW_t *state)

Return a normally distributed float from an XORWOW generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the XORWOW generator in *state*, increment position of generator by one.

The implementation uses a Box-Muller transform to generate two normally distributed results, then returns them one at a time. See `curand_normal2()` for a more efficient version that returns both results at once.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float **curand_normal**(curandStateSobol64_t *state)

Return a normally distributed float from a Sobol64 generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the Sobol64 generator in *state*, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float **curand_normal**(curandStateMtg32_t *state)

Return a normally distributed float from a MTGP32 generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the MTGP32 generator in state, increment position of generator.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float **curand_normal**(curandStatePhilox4_32_10_t *state)

Return a normally distributed float from an Philox4_32_10 generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the Philox4_32_10 generator in state, increment position of generator by one.

The implementation uses a Box-Muller transform to generate two normally distributed results, then returns them one at a time. See curand_normal2() for a more efficient version that returns both results at once.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float **curand_normal**(curandStateSobol32_t *state)

Return a normally distributed float from a Sobol32 generator.

Return a single normally distributed float with mean 0.0f and standard deviation 1.0f from the Sobol32 generator in state, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float with mean 0.0f and standard deviation 1.0f

__device__ static float2 **curand_normal12**(curandStatePhilox4_32_10_t *state)

Return two normally distributed floats from an Philox4_32_10 generator.

Return two normally distributed floats with mean 0.0f and standard deviation 1.0f from the Philox4_32_10 generator in state, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float2 where each element is from a distribution with mean 0.0f and standard deviation 1.0f

`__device__ static float2 curand_normal12(curandStateXORWOW_t *state)`

Return two normally distributed floats from an XORWOW generator.

Return two normally distributed floats with mean `0.0f` and standard deviation `1.0f` from the XORWOW generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float2 where each element is from a distribution with mean `0.0f` and standard deviation `1.0f`

`__device__ static float2 curand_normal12(curandStateMRG32k3a_t *state)`

Return two normally distributed floats from an MRG32k3a generator.

Return two normally distributed floats with mean `0.0f` and standard deviation `1.0f` from the MRG32k3a generator in `state`, increment position of generator by two.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float2 where each element is from a distribution with mean `0.0f` and standard deviation `1.0f`

`__NV_SILENCE_DEPRECATED__ __device__ static double2 curand_normal12_double(curandStateMRG32k3a_t *state)`

Return two normally distributed doubles from an MRG32k3a generator.

Return two normally distributed doubles with mean `0.0` and standard deviation `1.0` from the MRG32k3a generator in `state`, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double2 where each element is from a distribution with mean `0.0` and standard deviation `1.0`

`__device__ static double2 curand_normal12_double(curandStateXORWOW_t *state)`

Return two normally distributed doubles from an XORWOW generator.

Return two normally distributed doubles with mean `0.0` and standard deviation `1.0` from the XORWOW generator in `state`, increment position of generator by 2.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double2 where each element is from a distribution with mean `0.0` and standard deviation `1.0`

`__device__ static double2 curand_normal12_double(curandStatePhilox4_32_10_t *state)`

Return two normally distributed doubles from an Philox4_32_10 generator.

Return two normally distributed doubles with mean 0.0 and standard deviation 1.0 from the Philox4_32_10 generator in `state`, increment position of generator by 2.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double2 where each element is from a distribution with mean 0.0 and standard deviation 1.0

`__device__ static float4 curand_normal14(curandStatePhilox4_32_10_t *state)`

Return four normally distributed floats from an Philox4_32_10 generator.

Return four normally distributed floats with mean 0.0f and standard deviation 1.0f from the Philox4_32_10 generator in `state`, increment position of generator by four.

The implementation uses a Box-Muller transform to generate two normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed float2 where each element is from a distribution with mean 0.0f and standard deviation 1.0f

`__NV_SILENCE_DEPRECATED_BEGIN __device__ static double4 curand_normal14_double(curandStatePhilox4_32_10_t *state)`

`__device__ static double curand_normal1_double(curandStateSobol64_t *state)`

Return a normally distributed double from a Sobol64 generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the Sobol64 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

`__device__ static double curand_normal1_double(curandStateMRG32k3a_t *state)`

Return a normally distributed double from an MRG32k3a generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the XORWOW generator in `state`, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results, then returns them one at a time. See `curand_normal2_double()` for a more efficient version that returns both results at once.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

`__device__ static double curand_normal_double(curandStateMtg32_t *state)`

Return a normally distributed double from an MTGP32 generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the MTGP32 generator in `state`, increment position of generator.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

`__device__ static double curand_normal_double(curandStateScrambledSobol64_t *state)`

Return a normally distributed double from a scrambled Sobol64 generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the scrambled Sobol64 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

`__device__ static double curand_normal_double(curandStatePhilox4_32_10_t *state)`

Return a normally distributed double from an Philox4_32_10 generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the Philox4_32_10 generator in `state`, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results, then returns them one at a time. See `curand_normal2_double()` for a more efficient version that returns both results at once.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

`__device__ static double curand_normal_double(curandStateScrambledSobol32_t *state)`

Return a normally distributed double from a scrambled Sobol32 generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the scrambled Sobol32 generator in `state`, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

__device__ static double **curand_normal_double**(curandStateXORWOW_t *state)

Return a normally distributed double from an XORWOW generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the XORWOW generator in *state*, increment position of generator.

The implementation uses a Box-Muller transform to generate two normally distributed results, then returns them one at a time. See `curand_normal2_double()` for a more efficient version that returns both results at once.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

__device__ static double **curand_normal_double**(curandStateSobol32_t *state)

Return a normally distributed double from an Sobol32 generator.

Return a single normally distributed double with mean 0.0 and standard deviation 1.0 from the Sobol32 generator in *state*, increment position of generator by one.

The implementation uses the inverse cumulative distribution function to generate normally distributed results.

Parameters

state -- Pointer to state to update

Returns

Normally distributed double with mean 0.0 and standard deviation 1.0

__device__ static unsigned int **curand_poisson**(curandStateSobol64_t *state, double lambda)

Return a Poisson-distributed unsigned int from a Sobol64 generator.

Return a single unsigned int from a Poisson distribution with lambda *lambda* from the Sobol64 generator in *state*, increment position of generator by one.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda *lambda*

__device__ static unsigned int **curand_poisson**(curandStateScrambledSobol32_t *state, double lambda)

Return a Poisson-distributed unsigned int from a scrambled Sobol32 generator.

Return a single unsigned int from a Poisson distribution with lambda *lambda* from the scrambled Sobol32 generator in *state*, increment the position of the generator by one.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda *lambda*

`__device__ static unsigned int curand_poisson(curandStateMtg32_t *state, double lambda)`

Return a Poisson-distributed unsigned int from a MTGP32 generator.

Return a single int from a Poisson distribution with lambda `lambda` from the MTGP32 generator in `state`, increment the position of the generator by one.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

`__device__ static unsigned int curand_poisson(curandStateScrambledSobol64_t *state, double lambda)`

Return a Poisson-distributed unsigned int from a scrambled Sobol64 generator.

Return a single unsigned int from a Poisson distribution with lambda `lambda` from the scrambled Sobol64 generator in `state`, increment position of generator by one.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

`__device__ static unsigned int curand_poisson(curandStateSobol32_t *state, double lambda)`

Return a Poisson-distributed unsigned int from a Sobol32 generator.

Return a single unsigned int from a Poisson distribution with lambda `lambda` from the Sobol32 generator in `state`, increment the position of the generator by one.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

`__device__ static unsigned int curand_poisson(curandStatePhilox4_32_10_t *state, double lambda)`

Return a Poisson-distributed unsigned int from a Philox4_32_10 generator.

Return a single unsigned int from a Poisson distribution with lambda `lambda` from the Philox4_32_10 generator in `state`, increment the position of the generator by a variable amount, depending on the algorithm used.

Parameters

- ▶ **state** -- Pointer to state to update
- ▶ **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

```
__device__ static unsigned int curand_poisson(curandStateXORWOW_t *state, double lambda)
```

Return a Poisson-distributed unsigned int from a XORWOW generator.

Return a single unsigned int from a Poisson distribution with lambda `lambda` from the XORWOW generator in `state`, increment the position of the generator by a variable amount, depending on the algorithm used.

Parameters

- **state** -- Pointer to state to update
- **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

```
__device__ static unsigned int curand_poisson(curandStateMRG32k3a_t *state, double lambda)
```

Return a Poisson-distributed unsigned int from a MRG32k3A generator.

Return a single unsigned int from a Poisson distribution with lambda `lambda` from the MRG32k3a generator in `state`, increment the position of the generator by a variable amount, depending on the algorithm used.

Parameters

- **state** -- Pointer to state to update
- **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

```
__device__ static uint4 curand_poisson4(curandStatePhilox4_32_10_t *state, double lambda)
```

Return four Poisson-distributed unsigned ints from a Philox4_32_10 generator.

Return a four unsigned ints from a Poisson distribution with lambda `lambda` from the Philox4_32_10 generator in `state`, increment the position of the generator by a variable amount, depending on the algorithm used.

Parameters

- **state** -- Pointer to state to update
- **lambda** -- Lambda of the Poisson distribution

Returns

Poisson-distributed unsigned int with lambda `lambda`

```
template<typename STATE>
```

```
__device__ static unsigned int curand_poisson_from_normal(STATE state, double lambda)
```

```
template<typename STATE>
```

```
__device__ static uint4 curand_poisson_from_normal4(STATE state, double lambda)
```

```
template<typename T>
```

```
__device__ static unsigned int curand_poisson_gammainc(T state, float lambda)
```

```
template<typename T>
```

```
__device__ static uint4 curand_poisson_gammainc4(T state, float lambda)
```

```
template<typename T>
```

```
__device__ static unsigned int curand_poisson_knuth(T *state, float lambda)
```

```
template<typename T>
```

```
__device__ static uint4 curand_poisson_knuth4(T *state, float lambda)
```

```
__device__ static float curand_uniform(curandStateMtg32_t *state)
```

Return a uniformly distributed float from a MTGP32 generator.

Return a uniformly distributed float between 0.0f and 1.0f from the MTGP32 generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0f and 1.0f

```
__device__ static float curand_uniform(curandStateTest_t *state)
```

```
__device__ static float curand_uniform(curandStateSobol32_t *state)
```

Return a uniformly distributed float from a Sobol32 generator.

Return a uniformly distributed float between 0.0f and 1.0f from the Sobol32 generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()`.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0f and 1.0f

```
__device__ static float curand_uniform(curandStateScrambledSobol64_t *state)
```

Return a uniformly distributed float from a scrambled Sobol64 generator.

Return a uniformly distributed float between 0.0f and 1.0f from the scrambled Sobol64 generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()`.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0f and 1.0f

```
__NV_SILENCE_DEPRECATED__ __device__ static float curand_uniform(curandStatePhilox4_32_10_t *state)
```

Return a uniformly distributed float from a Philox4_32_10 generator.

Return a uniformly distributed float between 0.0f and 1.0f from the Philox4_32_10 generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0 and 1.0

__device__ static float **curand_uniform**(curandStateScrambledSobol32_t *state)

Return a uniformly distributed float from a scrambled Sobol32 generator.

Return a uniformly distributed float between 0.0f and 1.0f from the scrambled Sobol32 generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()`.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0f and 1.0f

__device__ static float **curand_uniform**(curandStateSobol64_t *state)

Return a uniformly distributed float from a Sobol64 generator.

Return a uniformly distributed float between 0.0f and 1.0f from the Sobol64 generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()`.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0f and 1.0f

__device__ static float **curand_uniform**(curandStateMRG32k3a_t *state)

Return a uniformly distributed float from an MRG32k3a generator.

Return a uniformly distributed float between 0.0f and 1.0f from the MRG32k3a generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

The implementation returns up to 23 bits of mantissa, with the minimum return value 2^{-32}

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between 0.0f and 1.0f

__device__ static float **curand_uniform**(curandStateXORWOW_t *state)

Return a uniformly distributed float from an XORWOW generator.

Return a uniformly distributed float between 0.0f and 1.0f from the XORWOW generator in *state*, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

The implementation may use any number of calls to `curand()` to get enough random bits to create the return value. The current implementation uses one call.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between `0.0f` and `1.0f`

`__device__ static double2 curand_uniform2_double(curandStatePhilox4_32_10_t *state)`

Return a uniformly distributed tuple of 2 doubles from an `Philox4_32_10` generator.

Return a uniformly distributed 2 doubles (double4) between `0.0` and `1.0` from the `Philox4_32_10` generator in `state`, increment position of generator by 4. Output range excludes `0.0` but includes `1.0`. Denormalized floating point outputs are never returned.

Parameters

state -- Pointer to state to update

Returns

2 uniformly distributed doubles between `0.0` and `1.0`

`__device__ static float4 curand_uniform4(curandStatePhilox4_32_10_t *state)`

Return a uniformly distributed tuple of 4 floats from a `Philox4_32_10` generator.

Return a uniformly distributed 4 floats between `0.0f` and `1.0f` from the `Philox4_32_10` generator in `state`, increment position of generator by 4. Output range excludes `0.0f` but includes `1.0f`. Denormalized floating point outputs are never returned.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed float between `0.0` and `1.0`

`__NV_SILENCE_DEPRECATION_BEGIN __device__ static double4 curand_uniform4_double(curandStatePhilox4_32_10_t *state)`

`__device__ static double curand_uniform_double(curandStateScrambledSobol32_t *state)`

Return a uniformly distributed double from a scrambled `Sobol32` generator.

Return a uniformly distributed double between `0.0` and `1.0` from the scrambled `Sobol32` generator in `state`, increment position of generator. Output range excludes `0.0` but includes `1.0`. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()` to preserve the quasirandom properties of the sequence.

Note that the implementation uses only 32 random bits to generate a single double precision value.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between `0.0` and `1.0`

`__device__ static double curand_uniform_double(curandStateScrambledSobol64_t *state)`

Return a uniformly distributed double from a scrambled `Sobol64` generator.

Return a uniformly distributed double between 0.0 and 1.0 from the scrambled Sobol64 generator in `state`, increment position of generator. Output range excludes 0.0 but includes 1.0. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()` to preserve the quasirandom properties of the sequence.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0 and 1.0

`__device__ static double curand_uniform_double(curandStateMtg32_t *state)`

Return a uniformly distributed double from a MTGP32 generator.

Return a uniformly distributed double between 0.0f and 1.0f from the MTGP32 generator in `state`, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

Note that the implementation uses only 32 random bits to generate a single double precision value.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0f and 1.0f

`__device__ static double curand_uniform_double(curandStatePhilox4_32_10_t *state)`

Return a uniformly distributed double from a Philox4_32_10 generator.

Return a uniformly distributed double between 0.0f and 1.0f from the Philox4_32_10 generator in `state`, increment position of generator. Output range excludes 0.0f but includes 1.0f. Denormalized floating point outputs are never returned.

Note that the implementation uses only 32 random bits to generate a single double precision value.

`curand_uniform2_double()` is recommended for higher quality uniformly distributed double precision values.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0f and 1.0f

`__device__ static double curand_uniform_double(curandStateMRG32k3a_t *state)`

Return a uniformly distributed double from an MRG32k3a generator.

Return a uniformly distributed double between 0.0 and 1.0 from the MRG32k3a generator in `state`, increment position of generator. Output range excludes 0.0 but includes 1.0. Denormalized floating point outputs are never returned.

Note the implementation returns at most 32 random bits of mantissa as outlined in the seminal paper by L'Ecuyer.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0 and 1.0

`__device__ static double curand_uniform_double(curandStateTest_t *state)`

`__device__ static double curand_uniform_double(curandStateSobol32_t *state)`

Return a uniformly distributed double from a Sobol32 generator.

Return a uniformly distributed double between 0.0 and 1.0 from the Sobol32 generator in `state`, increment position of generator. Output range excludes 0.0 but includes 1.0. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()` to preserve the quasirandom properties of the sequence.

Note that the implementation uses only 32 random bits to generate a single double precision value.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0 and 1.0

`__device__ static double curand_uniform_double(curandStateSobol64_t *state)`

Return a uniformly distributed double from a Sobol64 generator.

Return a uniformly distributed double between 0.0 and 1.0 from the Sobol64 generator in `state`, increment position of generator. Output range excludes 0.0 but includes 1.0. Denormalized floating point outputs are never returned.

The implementation is guaranteed to use a single call to `curand()` to preserve the quasirandom properties of the sequence.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0 and 1.0

`__device__ static double curand_uniform_double(curandStateXORWOW_t *state)`

Return a uniformly distributed double from an XORWOW generator.

Return a uniformly distributed double between 0.0 and 1.0 from the XORWOW generator in `state`, increment position of generator. Output range excludes 0.0 but includes 1.0. Denormalized floating point outputs are never returned.

The implementation may use any number of calls to `curand()` to get enough random bits to create the return value. The current implementation uses exactly two calls.

Parameters

state -- Pointer to state to update

Returns

uniformly distributed double between 0.0 and 1.0

`static unsigned int ini_func1(unsigned int x)`

`static unsigned int ini_func2(unsigned int x)`

`__host__ static int mtgp32_init_by_array(unsigned int state[], const mtgp32_params_fast_t *para, unsigned int *array, int length)`

```
__host__ static int mtgp32_init_by_str(unsigned int state[], const mtgp32_params_fast_t *para,
                                       unsigned char *array)
```

```
__host__ static void mtgp32_init_state(unsigned int state[], const mtgp32_params_fast_t *para,
                                       unsigned int seed)
```

```
__device__ static unsigned int para_rec(mtgp32_kernel_params_t *k, unsigned int X1, unsigned int
                                       X2, unsigned int Y, int bid)
```

```
__device__ static void skipahead(unsigned long long n, curandStateMRG32k3a_t *state)
```

Update MRG32k3a state to skip n elements.

Update the MRG32k3a state in state to skip ahead n elements.

All values of n are valid. Large values require more computation and so will take more time to complete.

Parameters

- **n** -- Number of elements to skip
- **state** -- Pointer to state to update

```
template<typename T>
```

```
__device__ static curand_detail::enable_if<curand_detail::is_same<curandStateSobol64_t*, T>::value || curand_detail::
```

Update Sobol64 state to skip n elements.

Update the Sobol64 state in state to skip ahead n elements.

All values of n are valid.

Parameters

- **n** -- Number of elements to skip
- **state** -- Pointer to state to update

```
__device__ static void skipahead(unsigned long long n, curandStateXORWOW_t *state)
```

Update XORWOW state to skip n elements.

Update the XORWOW state in state to skip ahead n elements.

All values of n are valid. Large values require more computation and so will take more time to complete.

Parameters

- **n** -- Number of elements to skip
- **state** -- Pointer to state to update

```
__device__ static void skipahead(unsigned long long n, curandStateTest_t *state)
```

```
template<typename T>
```

```
__device__ static curand_detail::enable_if<curand_detail::is_same<curandStateSobol32_t*, T>::value || curand_detail::
```

Update Sobol32 state to skip n elements.

Update the Sobol32 state in `state` to skip ahead n elements.

All values of n are valid.

Parameters

- **n** -- Number of elements to skip
- **state** -- Pointer to state to update

```
__device__ static void skipahead(unsigned long long n, curandStatePhilox4_32_10_t *state)
```

Update Philox4_32_10 state to skip n elements.

Update the Philox4_32_10 state in `state` to skip ahead n elements.

All values of n are valid.

Parameters

- **n** -- Number of elements to skip
- **state** -- Pointer to state to update

```
__device__ static void skipahead_sequence(unsigned long long n, curandStateMRG32k3a_t  
                                           *state)
```

Update MRG32k3a state to skip ahead n sequences.

Update the MRG32k3a state in `state` to skip ahead n sequences. Each sequence is elements long, so this means the function will skip ahead * n elements.

All values of n are valid. Large values require more computation and so will take more time to complete.

Parameters

- **n** -- Number of sequences to skip
- **state** -- Pointer to state to update

```
__device__ static void skipahead_sequence(unsigned long long n, curandStatePhilox4_32_10_t  
                                           *state)
```

Update Philox4_32_10 state to skip ahead n subsequences.

Update the Philox4_32_10 state in `state` to skip ahead n subsequences. Each subsequence is elements long, so this means the function will skip ahead * n elements.

All values of n are valid.

Parameters

- **n** -- Number of subsequences to skip
- **state** -- Pointer to state to update

__device__ static void **skipahead_sequence**(unsigned long long n, curandStateXORWOW_t *state)

Update XORWOW state to skip ahead n subsequences.

Update the XORWOW state in state to skip ahead n subsequences. Each subsequence is elements long, so this means the function will skip ahead * n elements.

All values of n are valid. Large values require more computation and so will take more time to complete.

Parameters

- **n** -- Number of subsequences to skip
- **state** -- Pointer to state to update

__device__ static void **skipahead_subsequence**(unsigned long long n, curandStateMRG32k3a_t *state)

Update MRG32k3a state to skip ahead n subsequences.

Update the MRG32k3a state in state to skip ahead n subsequences. Each subsequence is elements long, so this means the function will skip ahead * n elements.

Valid values of n are 0 to . Note n will be masked to 51 bits

Parameters

- **n** -- Number of subsequences to skip
- **state** -- Pointer to state to update

__device__ static unsigned int **temper**(mtgp32_kernel_params_t *k, unsigned int V, unsigned int T, int bid)

__device__ static unsigned int **temper_single**(mtgp32_kernel_params_t *k, unsigned int V, unsigned int T, int bid)

CURAND_VER_MAJOR

CURAND_VER_MINOR

CURAND_VER_PATCH

Enumerations

curandDirectionVectorSet

CURAND choice of direction vector set.

curandOrdering

CURAND ordering of results in memory.

curandRngType

CURAND generator types.

curandStatus

CURAND function call status types.

Functions

curandStatus_t ***curandCreateGenerator***(curandGenerator_t *generator, curandRngType_t rng_type)
Create new random number generator.

curandStatus_t ***curandCreateGeneratorHost***(curandGenerator_t *generator, curandRngType_t rng_type)
Create new host CPU random number generator.

curandStatus_t ***curandCreatePoissonDistribution***(double lambda, curandDiscreteDistribution_t *discrete_distribution)
Construct the histogram array for a Poisson distribution.

curandStatus_t ***curandDestroyDistribution***(curandDiscreteDistribution_t discrete_distribution)
Destroy the histogram array for a discrete distribution (e.g.

curandStatus_t ***curandDestroyGenerator***(curandGenerator_t generator)
Destroy an existing generator.

curandStatus_t ***curandGenerate***(curandGenerator_t generator, unsigned int *outputPtr, size_t num)
Generate 32-bit pseudo or quasirandom numbers.

curandStatus_t *curandGenerateBinomial*(curandGenerator_t generator, unsigned int *outputPtr, size_t num, unsigned int n, double p)

curandStatus_t *curandGenerateBinomialMethod*(curandGenerator_t generator, unsigned int *outputPtr, size_t num, unsigned int n, double p, curandMethod_t method)

curandStatus_t *curandGenerateLogNormal*(curandGenerator_t generator, float *outputPtr, size_t n, float mean, float stddev)

Generate log-normally distributed floats.

curandStatus_t *curandGenerateLogNormalDouble*(curandGenerator_t generator, double *outputPtr, size_t n, double mean, double stddev)

Generate log-normally distributed doubles.

curandStatus_t *curandGenerateLongLong*(curandGenerator_t generator, unsigned long long *outputPtr, size_t num)

Generate 64-bit quasirandom numbers.

curandStatus_t *curandGenerateNormal*(curandGenerator_t generator, float *outputPtr, size_t n, float mean, float stddev)

Generate normally distributed doubles.

curandStatus_t *curandGenerateNormalDouble*(curandGenerator_t generator, double *outputPtr, size_t n, double mean, double stddev)

Generate normally distributed doubles.

curandStatus_t *curandGeneratePoisson*(curandGenerator_t generator, unsigned int *outputPtr, size_t n, double lambda)

Generate Poisson-distributed unsigned ints.

curandStatus_t *curandGeneratePoissonMethod*(curandGenerator_t generator, unsigned int *outputPtr, size_t n, double lambda, curandMethod_t method)

curandStatus_t *curandGenerateSeeds*(curandGenerator_t generator)

Setup starting states.

curandStatus_t *curandGenerateUniform*(curandGenerator_t generator, float *outputPtr, size_t num)

Generate uniformly distributed floats.

curandStatus_t *curandGenerateUniformDouble*(curandGenerator_t generator, double *outputPtr, size_t num)

Generate uniformly distributed doubles.

curandStatus_t *curandGetDirectionVectors32*(curandDirectionVectors32_t *vectors[], curandDirectionVectorSet_t set)

Get direction vectors for 32-bit quasirandom number generation.

curandStatus_t *curandGetDirectionVectors64*(curandDirectionVectors64_t *vectors[], curandDirectionVectorSet_t set)

Get direction vectors for 64-bit quasirandom number generation.

curandStatus_t *curandGetProperty*(libraryPropertyType type, int *value)

Return the value of the curand property.

curandStatus_t *curandGetScrambleConstants32*(unsigned int **constants)

Get scramble constants for 32-bit scrambled Sobol'.

curandStatus_t *curandGetScrambleConstants64*(unsigned long long **constants)

Get scramble constants for 64-bit scrambled Sobol'.

curandStatus_t *curandGetVersion*(int *version)

Return the version number of the library.

curandStatus_t *curandSetGeneratorOffset*(curandGenerator_t generator, unsigned long long offset)

Set the absolute offset of the pseudo or quasirandom number generator.

curandStatus_t *curandSetGeneratorOrdering*(curandGenerator_t generator, curandOrdering_t order)

Set the ordering of results of the pseudo or quasirandom number generator.

curandStatus_t *curandSetPseudoRandomGeneratorSeed*(curandGenerator_t generator, unsigned long long seed)

Set the seed value of the pseudo-random number generator.

curandStatus_t *curandSetQuasiRandomGeneratorDimensions*(curandGenerator_t generator, unsigned int num_dimensions)

Set the number of dimensions.

curandStatus_t *curandSetStream*(curandGenerator_t generator, cudaStream_t stream)

Set the current stream for CURAND kernel launches.

6.2.2. Enumerations

enum **curandDirectionVectorSet**

CURAND choice of direction vector set.

Values:

enumerator **CURAND_DIRECTION_VECTORS_32_JOEKU06**

Specific set of 32-bit direction vectors generated from polynomials recommended by S. Joe and F. Y. Kuo, for up to 20,000 dimensions.

enumerator **CURAND_SCRAMBLED_DIRECTION_VECTORS_32_JOEKU06**

Specific set of 32-bit direction vectors generated from polynomials recommended by S. Joe and F. Y. Kuo, for up to 20,000 dimensions, and scrambled.

enumerator **CURAND_DIRECTION_VECTORS_64_JOEKU06**

Specific set of 64-bit direction vectors generated from polynomials recommended by S. Joe and F. Y. Kuo, for up to 20,000 dimensions.

enumerator **CURAND_SCRAMBLED_DIRECTION_VECTORS_64_JOEKU06**

Specific set of 64-bit direction vectors generated from polynomials recommended by S. Joe and F. Y. Kuo, for up to 20,000 dimensions, and scrambled.

enum **curandOrdering**

CURAND ordering of results in memory.

Values:

enumerator **CURAND_ORDERING_PSEUDO_BEST**

Best ordering for pseudorandom results.

enumerator **CURAND_ORDERING_PSEUDO_DEFAULT**

Specific default thread sequence for pseudorandom results, same as CURAND_ORDERING_PSEUDO_BEST.

enumerator **CURAND_ORDERING_PSEUDO_SEEDED**

Specific seeding pattern for fast lower quality pseudorandom results.

enumerator **CURAND_ORDERING_PSEUDO_LEGACY**

Specific legacy sequence for pseudorandom results, guaranteed to remain the same for all cuRAND release.

enumerator **CURAND_ORDERING_PSEUDO_DYNAMIC**

Specific ordering adjusted to the device it is being executed on, provides the best performance.

enumerator **CURAND_ORDERING_QUASI_DEFAULT**

Specific n-dimensional ordering for quasirandom results.

enum **curandRngType**

CURAND generator types.

Values:

enumerator **CURAND_RNG_TEST**

enumerator **CURAND_RNG_PSEUDO_DEFAULT**

Default pseudorandom generator.

enumerator **CURAND_RNG_PSEUDO_XORWOW**

XORWOW pseudorandom generator.

enumerator **CURAND_RNG_PSEUDO_MRG32K3A**

MRG32k3a pseudorandom generator.

enumerator **CURAND_RNG_PSEUDO_MTGP32**

Mersenne Twister MTGP32 pseudorandom generator.

enumerator **CURAND_RNG_PSEUDO_MT19937**

Mersenne Twister MT19937 pseudorandom generator.

enumerator **CURAND_RNG_PSEUDO_PHILOX4_32_10**

PHILOX-4x32-10 pseudorandom generator.

enumerator **CURAND_RNG_QUASI_DEFAULT**

Default quasirandom generator.

enumerator **CURAND_RNG_QUASI_SOBOL32**

Sobol32 quasirandom generator.

enumerator **CURAND_RNG_QUASI_SCRAMBLED_SOBOL32**

Scrambled Sobol32 quasirandom generator.

enumerator **CURAND_RNG_QUASI_SOBOL64**

Sobol64 quasirandom generator.

enumerator **CURAND_RNG_QUASI_SCRAMBLED_SOBOL64**

Scrambled Sobol64 quasirandom generator.

enum **curandStatus**

CURAND function call status types.

Values:

enumerator **CURAND_STATUS_SUCCESS**

No errors.

enumerator **CURAND_STATUS_VERSION_MISMATCH**

Header file and linked library version do not match.

enumerator **CURAND_STATUS_NOT_INITIALIZED**

Generator not initialized.

enumerator **CURAND_STATUS_ALLOCATION_FAILED**

Memory allocation failed.

enumerator **CURAND_STATUS_TYPE_ERROR**

Generator is wrong type.

enumerator **CURAND_STATUS_OUT_OF_RANGE**

Argument out of range.

enumerator **CURAND_STATUS_LENGTH_NOT_MULTIPLE**

Length requested is not a multiple of dimension.

enumerator **CURAND_STATUS_DOUBLE_PRECISION_REQUIRED**

GPU does not have double precision required by MRG32k3a.

enumerator **CURAND_STATUS_LAUNCH_FAILURE**

Kernel launch failure.

enumerator **CURAND_STATUS_PREEXISTING_FAILURE**

Preexisting failure on library entry.

enumerator **CURAND_STATUS_INITIALIZATION_FAILED**

Initialization of CUDA failed.

enumerator **CURAND_STATUS_ARCH_MISMATCH**

Architecture mismatch, GPU does not support requested feature.

enumerator **CURAND_STATUS_INTERNAL_ERROR**

Internal library error.

6.2.3. Functions

`curandStatus_t curandCreateGenerator(curandGenerator_t *generator, curandRngType_t rng_type)`

Create new random number generator.

Creates a new random number generator of type `rng_type` and returns it in `*generator`.

Legal values for `rng_type` are:

- ▶ `CURAND_RNG_PSEUDO_DEFAULT`
- ▶ `CURAND_RNG_PSEUDO_XORWOW`
- ▶ `CURAND_RNG_PSEUDO_MRG32K3A`
- ▶ `CURAND_RNG_PSEUDO_MTGP32`
- ▶ `CURAND_RNG_PSEUDO_MT19937`
- ▶ `CURAND_RNG_PSEUDO_PHILOX4_32_10`
- ▶ `CURAND_RNG_QUASI_DEFAULT`

- ▶ CURAND_RNG_QUASI_SOBOL32
- ▶ CURAND_RNG_QUASI_SCRAMBLED_SOBOL32
- ▶ CURAND_RNG_QUASI_SOBOL64
- ▶ CURAND_RNG_QUASI_SCRAMBLED_SOBOL64

When `rng_type` is `CURAND_RNG_PSEUDO_DEFAULT`, the type chosen is `CURAND_RNG_PSEUDO_XORWOW`.

When `rng_type` is `CURAND_RNG_QUASI_DEFAULT`, the type chosen is `CURAND_RNG_QUASI_SOBOL32`.

The default values for `rng_type = CURAND_RNG_PSEUDO_XORWOW` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_PSEUDO_MRG32K3A` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_PSEUDO_MTGP32` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_PSEUDO_MT19937` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`
- ▶ The default values for `rng_type = CURAND_RNG_PSEUDO_PHILOX4_32_10` are:
 - ▶ `seed = 0`
 - ▶ `offset = 0`
 - ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SOBOL32` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SOBOL64` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SCRAMBBLED_SOBOL32` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SCRAMBLED_SOBOL64` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

Parameters

- ▶ **generator** -- Pointer to generator
- ▶ **rng_type** -- Type of generator to create

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED`, if memory could not be allocated
- ▶ `CURAND_STATUS_INITIALIZATION_FAILED` if there was a problem setting up the GPU
- ▶ `CURAND_STATUS_VERSION_MISMATCH` if the header file version does not match the dynamically linked library version
- ▶ `CURAND_STATUS_TYPE_ERROR` if the value for `rng_type` is invalid
- ▶ `CURAND_STATUS_SUCCESS` if generator was created successfully

`curandStatus_t` **curandCreateGeneratorHost**(`curandGenerator_t *generator`, `curandRngType_t rng_type`)

Create new host CPU random number generator.

Creates a new host CPU random number generator of type `rng_type` and returns it in `*generator`.

Legal values for `rng_type` are:

- ▶ `CURAND_RNG_PSEUDO_DEFAULT`
- ▶ `CURAND_RNG_PSEUDO_XORWOW`
- ▶ `CURAND_RNG_PSEUDO_MRG32K3A`
- ▶ `CURAND_RNG_PSEUDO_MTGP32`
- ▶ `CURAND_RNG_PSEUDO_MT19937`
- ▶ `CURAND_RNG_PSEUDO_PHILOX4_32_10`
- ▶ `CURAND_RNG_QUASI_DEFAULT`
- ▶ `CURAND_RNG_QUASI_SOBOL32`
- ▶ `CURAND_RNG_QUASI_SCRAMBLED_SOBOL32`
- ▶ `CURAND_RNG_QUASI_SOBOL64`
- ▶ `CURAND_RNG_QUASI_SCRAMBLED_SOBOL64`

When `rng_type` is `CURAND_RNG_PSEUDO_DEFAULT`, the type chosen is `CURAND_RNG_PSEUDO_XORWOW`.

When `rng_type` is `CURAND_RNG_QUASI_DEFAULT`, the type chosen is `CURAND_RNG_QUASI_SOBOL32`.

The default values for `rng_type = CURAND_RNG_PSEUDO_XORWOW` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_PSEUDO_MRG32K3A` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_PSEUDO_MTGP32` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_PSEUDO_MT19937` are:

- ▶ `seed = 0`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`
- ▶ The default values for `rng_type = CURAND_RNG_PSEUDO_PHILOX4_32_10` are:
 - ▶ `seed = 0`
 - ▶ `offset = 0`
 - ▶ `ordering = CURAND_ORDERING_PSEUDO_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SOBOL32` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SOBOL64` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SCRAMBLED_SOBOL32` are:

- ▶ `dimensions = 1`
- ▶ `offset = 0`
- ▶ `ordering = CURAND_ORDERING_QUASI_DEFAULT`

The default values for `rng_type = CURAND_RNG_QUASI_SCRAMBLED_SOBOL64` are:

- ▶ dimensions = 1
- ▶ offset = 0
- ▶ ordering = CURAND_ORDERING_QUASI_DEFAULT

Parameters

- ▶ **generator** -- Pointer to generator
- ▶ **rng_type** -- Type of generator to create

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if memory could not be allocated
- ▶ `CURAND_STATUS_INITIALIZATION_FAILED` if there was a problem setting up the GPU
- ▶ `CURAND_STATUS_VERSION_MISMATCH` if the header file version does not match the dynamically linked library version
- ▶ `CURAND_STATUS_TYPE_ERROR` if the value for `rng_type` is invalid
- ▶ `CURAND_STATUS_SUCCESS` if generator was created successfully

[illegible]

Construct the histogram array for a Poisson distribution.

Construct the histogram array for the Poisson distribution with lambda `lambda`. For lambda greater than 2000, an approximation with a normal distribution is used.

Parameters

- **lambda** -- lambda for the Poisson distribution
- **discrete_distribution** -- pointer to the histogram in device memory

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if memory could not be allocated
- ▶ `CURAND_STATUS_DOUBLE_PRECISION_REQUIRED` if the GPU does not support double precision
- ▶ `CURAND_STATUS_INITIALIZATION_FAILED` if there was a problem setting up the GPU
- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the distribution pointer was null
- ▶ `CURAND_STATUS_PREEXISTING_FAILURE` if there was an existing error from a previous kernel launch
- ▶ `CURAND_STATUS_OUT_OF_RANGE` if λ is non-positive or greater than 400,000
- ▶ `CURAND_STATUS_SUCCESS` if the histogram was generated successfully

curandStatus_t **curandDestroyDistribution**(curandDiscreteDistribution_t
discrete_distribution)

Destroy the histogram array for a discrete distribution (e.g. Poisson).

Destroy the histogram array for a discrete distribution created by `curandCreatePoissonDistribution`.

Parameters

discrete_distribution -- pointer to device memory where the histogram is stored

Returns

- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the histogram was never created
- ▶ `CURAND_STATUS_SUCCESS` if the histogram was destroyed successfully

curandStatus_t **curandDestroyGenerator**(curandGenerator_t generator)

Destroy an existing generator.

Destroy an existing generator and free all memory associated with its state.

Parameters

generator -- Generator to destroy

Returns

- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the generator was never created
- ▶ `CURAND_STATUS_SUCCESS` if generator was destroyed successfully

curandStatus_t **curandGenerate**(curandGenerator_t generator, unsigned int *outputPtr, size_t
num)

Generate 32-bit pseudo or quasirandom numbers.

Use generator to generate num 32-bit results into the device memory at outputPtr. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using `curandSetStream()`, or the null stream if no stream has been set.

Results are 32-bit values with every bit random.

Parameters

- ▶ **generator** -- Generator to use
- ▶ **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- ▶ **num** -- Number of random 32-bit values to generate

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if memory could not be allocated
- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the generator was never created
- ▶ `CURAND_STATUS_PREEXISTING_FAILURE` if there was an existing error from a previous kernel launch

- ▶ CURAND_STATUS_LENGTH_NOT_MULTIPLE if the number of output samples is not a multiple of the quasirandom dimension
- ▶ CURAND_STATUS_LAUNCH_FAILURE if the kernel launch failed for any reason
- ▶ CURAND_STATUS_TYPE_ERROR if the generator is a 64 bit quasirandom generator. (use *curandGenerateLongLong()* with 64 bit quasirandom generators)
- ▶ CURAND_STATUS_SUCCESS if the results were generated successfully

curandStatus_t **curandGenerateBinomial**(curandGenerator_t generator, unsigned int *outputPtr, size_t num, unsigned int n, double p)

curandStatus_t **curandGenerateBinomialMethod**(curandGenerator_t generator, unsigned int *outputPtr, size_t num, unsigned int n, double p, curandMethod_t method)

curandStatus_t **curandGenerateLogNormal**(curandGenerator_t generator, float *outputPtr, size_t n, float mean, float stddev)

Generate log-normally distributed floats.

Use *generator* to generate *n* float results into the device memory at *outputPtr*. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using *curandSetStream()*, or the null stream if no stream has been set.

Results are 32-bit floating point values with log-normal distribution based on an associated normal distribution with mean *mean* and standard deviation *stddev*.

Normally distributed results are generated from pseudorandom generators with a Box-Muller transform, and so require *n* to be even. Quasirandom generators use an inverse cumulative distribution function to preserve dimensionality. The normally distributed results are transformed into log-normal distribution.

There may be slight numerical differences between results generated on the GPU with generators created with *curandCreateGenerator()* and results calculated on the CPU with generators created with *curandCreateGeneratorHost()*. These differences arise because of differences in results for transcendental functions. In addition, future versions of CURAND may use newer versions of the CUDA math library, so different versions of CURAND may give slightly different numerical values.

Parameters

- ▶ **generator** -- Generator to use
- ▶ **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- ▶ **n** -- Number of floats to generate
- ▶ **mean** -- Mean of associated normal distribution
- ▶ **stddev** -- Standard deviation of associated normal distribution

Returns

- ▶ CURAND_STATUS_ALLOCATION_FAILED if memory could not be allocated
- ▶ CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- ▶ CURAND_STATUS_PREEXISTING_FAILURE if there was an existing error from a previous kernel launch

- ▶ `CURAND_STATUS_LAUNCH_FAILURE` if the kernel launch failed for any reason
- ▶ `CURAND_STATUS_LENGTH_NOT_MULTIPLE` if the number of output samples is not a multiple of the quasirandom dimension, or is not a multiple of two for pseudorandom generators
- ▶ `CURAND_STATUS_SUCCESS` if the results were generated successfully

`curandStatus_t curandGenerateLogNormalDouble`(`curandGenerator_t` generator, `double` *outputPtr, `size_t` n, `double` mean, `double` stddev)

Generate log-normally distributed doubles.

Use `generator` to generate `n` double results into the device memory at `outputPtr`. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using `curandSetStream()`, or the null stream if no stream has been set.

Results are 64-bit floating point values with log-normal distribution based on an associated normal distribution with mean `mean` and standard deviation `stddev`.

Normally distributed results are generated from pseudorandom generators with a Box-Muller transform, and so require `n` to be even. Quasirandom generators use an inverse cumulative distribution function to preserve dimensionality. The normally distributed results are transformed into log-normal distribution.

There may be slight numerical differences between results generated on the GPU with generators created with `curandCreateGenerator()` and results calculated on the CPU with generators created with `curandCreateGeneratorHost()`. These differences arise because of differences in results for transcendental functions. In addition, future versions of CURAND may use newer versions of the CUDA math library, so different versions of CURAND may give slightly different numerical values.

Parameters

- ▶ **generator** -- Generator to use
- ▶ **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- ▶ **n** -- Number of doubles to generate
- ▶ **mean** -- Mean of normal distribution
- ▶ **stddev** -- Standard deviation of normal distribution

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if memory could not be allocated
- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the generator was never created
- ▶ `CURAND_STATUS_PREEXISTING_FAILURE` if there was an existing error from a previous kernel launch
- ▶ `CURAND_STATUS_LAUNCH_FAILURE` if the kernel launch failed for any reason
- ▶ `CURAND_STATUS_LENGTH_NOT_MULTIPLE` if the number of output samples is not a multiple of the quasirandom dimension, or is not a multiple of two for pseudorandom generators
- ▶ `CURAND_STATUS_DOUBLE_PRECISION_REQUIRED` if the GPU does not support double precision

- CURAND_STATUS_SUCCESS if the results were generated successfully

curandStatus_t **curandGenerateLongLong**(curandGenerator_t generator, unsigned long long *outputPtr, size_t num)

Generate 64-bit quasirandom numbers.

Use generator to generate num 64-bit results into the device memory at outputPtr. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using [curandSetStream\(\)](#), or the null stream if no stream has been set.

Results are 64-bit values with every bit random.

Parameters

- **generator** -- Generator to use
- **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- **num** -- Number of random 64-bit values to generate

Returns

- CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- CURAND_STATUS_PREEXISTING_FAILURE if there was an existing error from a previous kernel launch
- CURAND_STATUS_LENGTH_NOT_MULTIPLE if the number of output samples is not a multiple of the quasirandom dimension
- CURAND_STATUS_LAUNCH_FAILURE if the kernel launch failed for any reason
- CURAND_STATUS_TYPE_ERROR if the generator is not a 64 bit quasirandom generator
- CURAND_STATUS_SUCCESS if the results were generated successfully

curandStatus_t **curandGenerateNormal**(curandGenerator_t generator, float *outputPtr, size_t n, float mean, float stddev)

Generate normally distributed doubles.

Use generator to generate n float results into the device memory at outputPtr. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using [curandSetStream\(\)](#), or the null stream if no stream has been set.

Results are 32-bit floating point values with mean mean and standard deviation stddev.

Normally distributed results are generated from pseudorandom generators with a Box-Muller transform, and so require n to be even. Quasirandom generators use an inverse cumulative distribution function to preserve dimensionality.

There may be slight numerical differences between results generated on the GPU with generators created with [curandCreateGenerator\(\)](#) and results calculated on the CPU with generators created with [curandCreateGeneratorHost\(\)](#). These differences arise because of differences in results for transcendental functions. In addition, future versions of CURAND may use newer versions of the CUDA math library, so different versions of CURAND may give slightly different numerical values.

Parameters

- ▶ **generator** -- Generator to use
- ▶ **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- ▶ **n** -- Number of floats to generate
- ▶ **mean** -- Mean of normal distribution
- ▶ **stddev** -- Standard deviation of normal distribution

Returns

- ▶ CURAND_STATUS_ALLOCATION_FAILED if memory could not be allocated
- ▶ CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- ▶ CURAND_STATUS_PREEEXISTING_FAILURE if there was an existing error from a previous kernel launch
- ▶ CURAND_STATUS_LAUNCH_FAILURE if the kernel launch failed for any reason
- ▶ CURAND_STATUS_LENGTH_NOT_MULTIPLE if the number of output samples is not a multiple of the quasirandom dimension, or is not a multiple of two for pseudorandom generators
- ▶ CURAND_STATUS_SUCCESS if the results were generated successfully

curandStatus_t **curandGenerateNormalDouble**(curandGenerator_t generator, double *outputPtr, size_t n, double mean, double stddev)

Generate normally distributed doubles.

Use **generator** to generate **n** double results into the device memory at **outputPtr**. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using *curandSetStream()*, or the null stream if no stream has been set.

Results are 64-bit floating point values with mean **mean** and standard deviation **stddev**.

Normally distributed results are generated from pseudorandom generators with a Box-Muller transform, and so require **n** to be even. Quasirandom generators use an inverse cumulative distribution function to preserve dimensionality.

There may be slight numerical differences between results generated on the GPU with generators created with *curandCreateGenerator()* and results calculated on the CPU with generators created with *curandCreateGeneratorHost()*. These differences arise because of differences in results for transcendental functions. In addition, future versions of CURAND may use newer versions of the CUDA math library, so different versions of CURAND may give slightly different numerical values.

Parameters

- ▶ **generator** -- Generator to use
- ▶ **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- ▶ **n** -- Number of doubles to generate
- ▶ **mean** -- Mean of normal distribution

- **stddev** -- Standard deviation of normal distribution

Returns

- **CURAND_STATUS_ALLOCATION_FAILED** if memory could not be allocated
- **CURAND_STATUS_NOT_INITIALIZED** if the generator was never created
- **CURAND_STATUS_PREEXISTING_FAILURE** if there was an existing error from a previous kernel launch
- **CURAND_STATUS_LAUNCH_FAILURE** if the kernel launch failed for any reason
- **CURAND_STATUS_LENGTH_NOT_MULTIPLE** if the number of output samples is not a multiple of the quasirandom dimension, or is not a multiple of two for pseudorandom generators
- **CURAND_STATUS_DOUBLE_PRECISION_REQUIRED** if the GPU does not support double precision
- **CURAND_STATUS_SUCCESS** if the results were generated successfully

`curandStatus_t curandGeneratePoisson`(`curandGenerator_t generator`, `unsigned int *outputPtr`, `size_t n`, `double lambda`)

Generate Poisson-distributed unsigned ints.

Use `generator` to generate `n` unsigned int results into device memory at `outputPtr`. The device memory must have been previously allocated and must be large enough to hold all the results. Launches are done with the stream set using `curandSetStream()`, or the null stream if no stream has been set.

Results are 32-bit unsigned int point values with Poisson distribution, with `lambda` `lambda`.

Parameters

- **generator** -- Generator to use
- **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- **n** -- Number of unsigned ints to generate
- **lambda** -- `lambda` for the Poisson distribution

Returns

- **CURAND_STATUS_ALLOCATION_FAILED** if memory could not be allocated
- **CURAND_STATUS_NOT_INITIALIZED** if the generator was never created
- **CURAND_STATUS_PREEXISTING_FAILURE** if there was an existing error from a previous kernel launch
- **CURAND_STATUS_LAUNCH_FAILURE** if the kernel launch failed for any reason
- **CURAND_STATUS_LENGTH_NOT_MULTIPLE** if the number of output samples is not a multiple of the quasirandom dimension
- **CURAND_STATUS_DOUBLE_PRECISION_REQUIRED** if the GPU or sm does not support double precision
- **CURAND_STATUS_OUT_OF_RANGE** if `lambda` is non-positive or greater than 400,000

- CURAND_STATUS_SUCCESS if the results were generated successfully

curandStatus_t **curandGeneratePoissonMethod**(curandGenerator_t generator, unsigned int *outputPtr, size_t n, double lambda, curandMethod_t method)

curandStatus_t **curandGenerateSeeds**(curandGenerator_t generator)

Setup starting states.

Generate the starting state of the generator. This function is automatically called by generation functions such as *curandGenerate()* and *curandGenerateUniform()*. It can be called manually for performance testing reasons to separate timings for starting state generation and random number generation.

Parameters

generator -- Generator to update

Returns

- CURAND_STATUS_ALLOCATION_FAILED if memory could not be allocated
- CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- CURAND_STATUS_PREEXISTING_FAILURE if there was an existing error from a previous kernel launch
- CURAND_STATUS_LAUNCH_FAILURE if the kernel launch failed for any reason
- CURAND_STATUS_SUCCESS if the seeds were generated successfully

curandStatus_t **curandGenerateUniform**(curandGenerator_t generator, float *outputPtr, size_t num)

Generate uniformly distributed floats.

Use **generator** to generate **num** float results into the device memory at **outputPtr**. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using *curandSetStream()*, or the null stream if no stream has been set.

Results are 32-bit floating point values between 0.0f and 1.0f, excluding 0.0f and including 1.0f.

Parameters

- **generator** -- Generator to use
- **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- **num** -- Number of floats to generate

Returns

- CURAND_STATUS_ALLOCATION_FAILED if memory could not be allocated
- CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- CURAND_STATUS_PREEXISTING_FAILURE if there was an existing error from a previous kernel launch
- CURAND_STATUS_LAUNCH_FAILURE if the kernel launch failed for any reason

- ▶ `CURAND_STATUS_LENGTH_NOT_MULTIPLE` if the number of output samples is not a multiple of the quasirandom dimension
- ▶ `CURAND_STATUS_SUCCESS` if the results were generated successfully

`curandStatus_t curandGenerateUniformDouble`(`curandGenerator_t` generator, `double *outputPtr`, `size_t` num)

Generate uniformly distributed doubles.

Use `generator` to generate `num` double results into the device memory at `outputPtr`. The device memory must have been previously allocated and be large enough to hold all the results. Launches are done with the stream set using `curandSetStream()`, or the null stream if no stream has been set.

Results are 64-bit double precision floating point values between `0.0` and `1.0`, excluding `0.0` and including `1.0`.

Parameters

- ▶ **generator** -- Generator to use
- ▶ **outputPtr** -- Pointer to device memory to store CUDA-generated results, or Pointer to host memory to store CPU-generated results
- ▶ **num** -- Number of doubles to generate

Returns

- ▶ `CURAND_STATUS_ALLOCATION_FAILED` if memory could not be allocated
- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the generator was never created
- ▶ `CURAND_STATUS_PREEXISTING_FAILURE` if there was an existing error from a previous kernel launch
- ▶ `CURAND_STATUS_LAUNCH_FAILURE` if the kernel launch failed for any reason
- ▶ `CURAND_STATUS_LENGTH_NOT_MULTIPLE` if the number of output samples is not a multiple of the quasirandom dimension
- ▶ `CURAND_STATUS_DOUBLE_PRECISION_REQUIRED` if the GPU does not support double precision
- ▶ `CURAND_STATUS_SUCCESS` if the results were generated successfully

`curandStatus_t curandGetDirectionVectors32`(`curandDirectionVectors32_t *vectors[]`, `curandDirectionVectorSet_t` set)

Get direction vectors for 32-bit quasirandom number generation.

Get a pointer to an array of direction vectors that can be used for quasirandom number generation. The resulting pointer will reference an array of direction vectors in host memory.

The array contains vectors for many dimensions. Each dimension has 32 vectors. Each individual vector is an unsigned int.

Legal values for `set` are:

- ▶ `CURAND_DIRECTION_VECTORS_32_JOE KUO6` (20,000 dimensions)
- ▶ `CURAND_SCRAMBLE D_DIRECTION_VECTORS_32_JOE KUO6` (20,000 dimensions)

Parameters

- ▶ **vectors** -- Address of pointer in which to return direction vectors
- ▶ **set** -- Which set of direction vectors to use

Returns

- ▶ CURAND_STATUS_OUT_OF_RANGE if the choice of set is invalid
- ▶ CURAND_STATUS_SUCCESS if the pointer was set successfully

curandStatus_t **curandGetDirectionVectors64**(curandDirectionVectors64_t *vectors[],
curandDirectionVectorSet_t set)

Get direction vectors for 64-bit quasirandom number generation.

Get a pointer to an array of direction vectors that can be used for quasirandom number generation. The resulting pointer will reference an array of direction vectors in host memory.

The array contains vectors for many dimensions. Each dimension has 64 vectors. Each individual vector is an unsigned long long.

Legal values for set are:

- ▶ CURAND_DIRECTION_VECTORS_64_JOEKO6 (20,000 dimensions)
- ▶ CURAND_SCRAMBLED_DIRECTION_VECTORS_64_JOEKO6 (20,000 dimensions)

Parameters

- ▶ **vectors** -- Address of pointer in which to return direction vectors
- ▶ **set** -- Which set of direction vectors to use

Returns

- ▶ CURAND_STATUS_OUT_OF_RANGE if the choice of set is invalid
- ▶ CURAND_STATUS_SUCCESS if the pointer was set successfully

curandStatus_t **curandGetProperty**(libraryPropertyType type, int *value)

Return the value of the curand property.

Return in *value the number for the property described by type of the dynamically linked CURAND library.

Parameters

- ▶ **type** -- CUDA library property
- ▶ **value** -- integer value for the requested property

Returns

- ▶ CURAND_STATUS_SUCCESS if the property value was successfully returned
- ▶ CURAND_STATUS_OUT_OF_RANGE if the property type is not recognized

curandStatus_t **curandGetScrambleConstants32**(unsigned int **constants)

Get scramble constants for 32-bit scrambled Sobol'.

Get a pointer to an array of scramble constants that can be used for quasirandom number generation. The resulting pointer will reference an array of unsigned ints in host memory.

The array contains constants for many dimensions. Each dimension has a single unsigned int constant.

Parameters

constants -- Address of pointer in which to return scramble constants

Returns

- CURAND_STATUS_SUCCESS if the pointer was set successfully

curandStatus_t **curandGetScrambleConstants64**(unsigned long long **constants)

Get scramble constants for 64-bit scrambled Sobol'.

Get a pointer to an array of scramble constants that can be used for quasirandom number generation. The resulting pointer will reference an array of unsigned long longs in host memory.

The array contains constants for many dimensions. Each dimension has a single unsigned long long constant.

Parameters

constants -- Address of pointer in which to return scramble constants

Returns

- CURAND_STATUS_SUCCESS if the pointer was set successfully

curandStatus_t **curandGetVersion**(int *version)

Return the version number of the library.

Return in *version the version number of the dynamically linked CURAND library. The format is the same as CUDART_VERSION from the CUDA Runtime. The only supported configuration is CURAND version equal to CUDA Runtime version.

Parameters

version -- CURAND library version

Returns

- CURAND_STATUS_SUCCESS if the version number was successfully returned

curandStatus_t **curandSetGeneratorOffset**(curandGenerator_t generator, unsigned long long offset)

Set the absolute offset of the pseudo or quasirandom number generator.

Set the absolute offset of the pseudo or quasirandom number generator.

All values of offset are valid. The offset position is absolute, not relative to the current position in the sequence.

Parameters

- **generator** -- Generator to modify
- **offset** -- Absolute offset position

Returns

- ▶ CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- ▶ CURAND_STATUS_SUCCESS if generator offset was set successfully

curandStatus_t **curandSetGeneratorOrdering**(curandGenerator_t generator, curandOrdering_t order)

Set the ordering of results of the pseudo or quasirandom number generator.

Set the ordering of results of the pseudo or quasirandom number generator.

Legal values of order for pseudorandom generators are:

- ▶ CURAND_ORDERING_PSEUDO_DEFAULT
- ▶ CURAND_ORDERING_PSEUDO_BEST
- ▶ CURAND_ORDERING_PSEUDO_SEEDED
- ▶ CURAND_ORDERING_PSEUDO_LEGACY

Legal values of order for quasirandom generators are:

- ▶ CURAND_ORDERING_QUASI_DEFAULT

Parameters

- ▶ **generator** -- Generator to modify
- ▶ **order** -- Ordering of results

Returns

- ▶ CURAND_STATUS_NOT_INITIALIZED if the generator was never created
- ▶ CURAND_STATUS_OUT_OF_RANGE if the ordering is not valid
- ▶ CURAND_STATUS_SUCCESS if generator ordering was set successfully

curandStatus_t **curandSetPseudoRandomGeneratorSeed**(curandGenerator_t generator, unsigned long long seed)

Set the seed value of the pseudo-random number generator.

Set the seed value of the pseudorandom number generator. All values of seed are valid. Different seeds will produce different sequences. Different seeds will often not be statistically correlated with each other, but some pairs of seed values may generate sequences which are statistically correlated.

Parameters

- ▶ **generator** -- Generator to modify
- ▶ **seed** -- Seed value

Returns

- ▶ CURAND_STATUS_NOT_INITIALIZED if the generator was never created

- ▶ `CURAND_STATUS_TYPE_ERROR` if the generator is not a pseudorandom number generator
- ▶ `CURAND_STATUS_SUCCESS` if generator seed was set successfully

`curandStatus_t` **curandSetQuasiRandomGeneratorDimensions**(`curandGenerator_t` generator, unsigned int num_dimensions)

Set the number of dimensions.

Set the number of dimensions to be generated by the quasirandom number generator.

Legal values for num_dimensions are 1 to 20000.

Parameters

- ▶ **generator** -- Generator to modify
- ▶ **num_dimensions** -- Number of dimensions

Returns

- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the generator was never created
- ▶ `CURAND_STATUS_OUT_OF_RANGE` if num_dimensions is not valid
- ▶ `CURAND_STATUS_TYPE_ERROR` if the generator is not a quasirandom number generator
- ▶ `CURAND_STATUS_SUCCESS` if generator ordering was set successfully

`curandStatus_t` **curandSetStream**(`curandGenerator_t` generator, `cudaStream_t` stream)

Set the current stream for CURAND kernel launches.

Set the current stream for CURAND kernel launches. All library functions will use this stream until set again.

Parameters

- ▶ **generator** -- Generator to modify
- ▶ **stream** -- Stream to use or `::NULL` for null stream

Returns

- ▶ `CURAND_STATUS_NOT_INITIALIZED` if the generator was never created
- ▶ `CURAND_STATUS_SUCCESS` if stream was set successfully

Chapter 9. Acknowledgements

NVIDIA would like to thank the following individuals and institutions for their contributions:

- ▶ Portions of the MTGP32 (Mersenne Twister for GPU) library routines were written by Mutsuo Saito and Makoto Matsumoto.
- ▶ Portions of the PHILOX4x32 library routines were developed by D. E. Shaw Research.

Chapter 10. Notices

10.1. Notice

This document is provided for information purposes only and shall not be regarded as a warranty of a certain functionality, condition, or quality of a product. NVIDIA Corporation (“NVIDIA”) makes no representations or warranties, expressed or implied, as to the accuracy or completeness of the information contained in this document and assumes no responsibility for any errors contained herein. NVIDIA shall have no liability for the consequences or use of such information or for any infringement of patents or other rights of third parties that may result from its use. This document is not a commitment to develop, release, or deliver any Material (defined below), code, or functionality.

NVIDIA reserves the right to make corrections, modifications, enhancements, improvements, and any other changes to this document, at any time without notice.

Customer should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

NVIDIA products are sold subject to the NVIDIA standard terms and conditions of sale supplied at the time of order acknowledgement, unless otherwise agreed in an individual sales agreement signed by authorized representatives of NVIDIA and customer (“Terms of Sale”). NVIDIA hereby expressly objects to applying any customer general terms and conditions with regards to the purchase of the NVIDIA product referenced in this document. No contractual obligations are formed either directly or indirectly by this document.

NVIDIA products are not designed, authorized, or warranted to be suitable for use in medical, military, aircraft, space, or life support equipment, nor in applications where failure or malfunction of the NVIDIA product can reasonably be expected to result in personal injury, death, or property or environmental damage. NVIDIA accepts no liability for inclusion and/or use of NVIDIA products in such equipment or applications and therefore such inclusion and/or use is at customer’s own risk.

NVIDIA makes no representation or warranty that products based on this document will be suitable for any specified use. Testing of all parameters of each product is not necessarily performed by NVIDIA. It is customer’s sole responsibility to evaluate and determine the applicability of any information contained in this document, ensure the product is suitable and fit for the application planned by customer, and perform the necessary testing for the application in order to avoid a default of the application or the product. Weaknesses in customer’s product designs may affect the quality and reliability of the NVIDIA product and may result in additional or different conditions and/or requirements beyond those contained in this document. NVIDIA accepts no liability related to any default, damage, costs, or problem which may be based on or attributable to: (i) the use of the NVIDIA product in any manner that is contrary to this document or (ii) customer product designs.

No license, either expressed or implied, is granted under any NVIDIA patent right, copyright, or other NVIDIA intellectual property right under this document. Information published by NVIDIA regarding third-party products or services does not constitute a license from NVIDIA to use such products or

services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property rights of the third party, or a license from NVIDIA under the patents or other intellectual property rights of NVIDIA.

Reproduction of information in this document is permissible only if approved in advance by NVIDIA in writing, reproduced without alteration and in full compliance with all applicable export laws and regulations, and accompanied by all associated conditions, limitations, and notices.

THIS DOCUMENT AND ALL NVIDIA DESIGN SPECIFICATIONS, REFERENCE BOARDS, FILES, DRAWINGS, DIAGNOSTICS, LISTS, AND OTHER DOCUMENTS (TOGETHER AND SEPARATELY, "MATERIALS") ARE BEING PROVIDED "AS IS." NVIDIA MAKES NO WARRANTIES, EXPRESSED, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE MATERIALS, AND EXPRESSLY DISCLAIMS ALL IMPLIED WARRANTIES OF NONINFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE. TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL NVIDIA BE LIABLE FOR ANY DAMAGES, INCLUDING WITHOUT LIMITATION ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF ANY USE OF THIS DOCUMENT, EVEN IF NVIDIA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Notwithstanding any damages that customer might incur for any reason whatsoever, NVIDIA's aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms of Sale for the product.
