Chapter 1.
MODULES

Here is a list of all modules:

- Error Handling
- General Information Query
- Compilation

1.1. Error Handling

enum nvvmResult

NVVM API call result code.

Values

NVVM_SUCCESS = 0
NVVM_ERROR_OUT_OF_MEMORY = 1
NVVM_ERROR_PROGRAM_CREATION_FAILURE = 2
NVVM_ERROR_IR_VERSION_MISMATCH = 3
NVVM_ERROR_INVALID_INPUT = 4
NVVM_ERROR_INVALID_PROGRAM = 5
NVVM_ERROR_INVALID_IR = 6
NVVM_ERROR_INVALID_OPTION = 7
NVVM_ERROR_NO_MODULE_IN_PROGRAM = 8
NVVM_ERROR_COMPILATION = 9
const char *nvvmGetErrorString (nvvmResult result)
Get the message string for the given nvvmResult code.

Parameters
result
NVVM API result code.

Returns
Message string for the given nvvmResult code.

1.2. General Information Query

nvvmResult nvvmIRVersion (int *majorIR, int *minorIR,
int *majorDbg, int *minorDbg)
Get the NVVM IR version.

Parameters
majorIR
NVVM IR major version number.
minorIR
NVVM IR minor version number.
majorDbg
NVVM IR debug metadata major version number.
minorDbg
NVVM IR debug metadata minor version number.

Returns
- NVVM_SUCCESS

nvvmResult nvvmVersion (int *major, int *minor)
Get the NVVM version.

Parameters
major
NVVM major version number.
minor
NVVM minor version number.
Returns

- NVVM_SUCCESS

1.3. Compilation

typedef _nvvmProgram *nvvmProgram

NVVM Program.
An opaque handle for a program

nvvmResult nvvmAddModuleToProgram (nvvmProgram prog, const char *buffer, size_t size, const char *name)

Add a module level NVVM IR to a program.

Parameters

prog
    NVVM program.
buffer
    NVVM IR module in the bitcode or text representation.
size
    Size of the NVVM IR module.
name
    Name of the NVVM IR module. If NULL, "<unnamed>" is used as the name.

Returns

- NVVM_SUCCESS
- NVVM_ERROR_OUT_OF_MEMORY
- NVVM_ERROR_INVALID_INPUT
- NVVM_ERROR_INVALID_PROGRAM

Description

The buffer should contain an NVVM IR module. The module may have NVVM IR version 1.5 in LLVM 5.0 bitcode format. Alternatively, the module may have NVVM IR version 1.2 either in the LLVM 3.4 bitcode representation or in the LLVM 3.4 text representation. Support for reading the text representation of NVVM IR is deprecated and may be removed in a later version.
nvvmResult nvvmCompileProgram (nvvmProgram prog, int numOptions, const char **options)

Compile the NVVM program.

Parameters

prog
    NVVM program.

numOptions
    Number of compiler options passed.

options
    Compiler options in the form of C string array.

Returns

- NVVM_SUCCESS
- NVVM_ERROR_OUT_OF_MEMORY
- NVVM_ERROR_IR_VERSION_MISMATCH
- NVVM_ERROR_INVALID_PROGRAM
- NVVM_ERROR_INVALID_OPTION
- NVVM_ERROR_NO_MODULE_IN_PROGRAM
- NVVM_ERROR_COMPILATION

Description

The NVVM IR modules in the program will be linked at the IR level. The linked IR program is compiled to PTX.

The target datalayout in the linked IR program is used to determine the address size (32bit vs 64bit).

The valid compiler options are:

- -g (enable generation of debugging information, valid only with -opt=0)
- -generate-line-info (generate line number information)
- -opt=
    - 0 (disable optimizations)
    - 3 (default, enable optimizations)
- -arch=
    - compute_30 (default)
    - compute_32
    - compute_35
    - compute_37
-ftz=
  -ftz= 0 (default, preserve denormal values, when performing single-precision floating-point operations)
  -ftz= 1 (flush denormal values to zero, when performing single-precision floating-point operations)

-prec-sqrt=
  -prec-sqrt= 0 (use a faster approximation for single-precision floating-point square root)
  -prec-sqrt= 1 (default, use IEEE round-to-nearest mode for single-precision floating-point square root)

-prec-div=
  -prec-div= 0 (use a faster approximation for single-precision floating-point division and reciprocals)
  -prec-div= 1 (default, use IEEE round-to-nearest mode for single-precision floating-point division and reciprocals)

-fma=
  -fma= 0 (disable FMA contraction)
  -fma= 1 (default, enable FMA contraction)

nvvmResult nvvmCreateProgram (nvvmProgram *prog)
Create a program, and set the value of its handle to *prog.

Parameters
prog
  prog NVVM program.

Returns
  - NVVM_SUCCESS
  - NVVM_ERROR_OUT_OF_MEMORY
  - NVVM_ERROR_INVALID_PROGRAM
Description

See also:

nvvmDestroyProgram()

nvvmResult nvvmDestroyProgram (nvvmProgram *prog)
Destroy a program.

Parameters

prog
   NVVM program.

Returns

- NVVM_SUCCESS
- NVVM_ERROR_INVALID_PROGRAM

Description

See also:

nvvmCreateProgram()

nvvmResult nvvmGetCompiledResult (nvvmProgram prog, char *buffer)
Get the compiled result.

Parameters

prog
   NVVM program.
buffer
   Compiled result.

Returns

- NVVM_SUCCESS
- NVVM_ERROR_INVALID_PROGRAM

Description

The result is stored in the memory pointed by 'buffer'.

nvvmResult nvvmGetCompiledResultSize (nvvmProgram prog, size_t *bufferSizeRet)
Get the size of the compiled result.

Parameters

prog
    NVVM program.
bufferSizeRet
    Size of the compiled result (including the trailing NULL).

Returns

- NVVM_SUCCESS
- NVVM_ERROR_INVALID_PROGRAM

nvvmResult nvvmGetProgramLog (nvvmProgram prog, char *buffer)
Get the Compiler/Verifier Message.

Parameters

prog
    NVVM program.
buffer
    Compilation/Verification log.

Returns

- NVVM_SUCCESS
- NVVM_ERROR_INVALID_PROGRAM

Description
The NULL terminated message string is stored in the memory pointed by 'buffer' when the return value is NVVM_SUCCESS.
nvvmResult nvvmGetProgramLogSize (nvvmProgram prog, size_t *bufferSizeRet)
Get the Size of Compiler/Verifier Message.

Parameters

 prog
  NVVM program.
 bufferSizeRet
  Size of the compilation/verification log (including the trailing NULL).

Returns

 ▶ NVVM_SUCCESS
 ▶ NVVM_ERROR_INVALID_PROGRAM

Description
The size of the message string (including the trailing NULL) is stored into 'buffer_size_ret' when the return value is NVVM_SUCCESS.

nvvmResult nvvmLazyAddModuleToProgram
(nvvmProgram prog, const char *buffer, size_t size, const char *name)
Add a module level NVVM IR to a program.

Parameters

 prog
  NVVM program.
 buffer
  NVVM IR module in the bitcode representation.
 size
  Size of the NVVM IR module.
 name
  Name of the NVVM IR module. If NULL, "<unnamed>" is used as the name.

Returns

 ▶ NVVM_SUCCESS
 ▶ NVVM_ERROR_OUT_OF_MEMORY
 ▶ NVVM_ERROR_INVALID_INPUT
 ▶ NVVM_ERROR_INVALID_PROGRAM
Description

The buffer should contain an NVVM IR module. The module may have NVVM IR version 1.5 in LLVM 5.0 bitcode format. Alternatively, the module may have NVVM IR version 1.2 in the LLVM 3.4 bitcode representation.

A module added using this API is lazily loaded - the only symbols loaded are those that are required by module(s) loaded using nvvmAddModuleToProgram. It is an error for a program to have all modules loaded using this API. Compiler may also optimize entities in this module by making them internal to the linked NVVM IR module, making them eligible for other optimizations. Due to these optimizations, this API to load a module is more efficient and should be used where possible.

```
nvvmResult nvvmVerifyProgram (nvvmProgram prog, int numOptions, const char **options)
```

Verify the NVVM program.

Parameters

- **prog**
  - NVVM program.

- **numOptions**
  - Number of compiler options passed.

- **options**
  - Compiler options in the form of C string array.

Returns

- NVVM_SUCCESS
- NVVM_ERROR_OUT_OF_MEMORY
- NVVM_ERROR_IR_VERSION_MISMATCH
- NVVM_ERROR_INVALID_PROGRAM
- NVVM_ERROR_INVALID_IR
- NVVM_ERROR_INVALID_OPTION
- NVVM_ERROR_NO_MODULE_IN_PROGRAM

Description

The valid compiler options are:

Same as for `nvvmCompileProgram()`.
