NVIDIA COLLECTIVE COMMUNICATION LIBRARY (NCCL)

Installation Guide

TABLE OF CONTENTS

Chapter 1.
OVERVIEW

The NVIDIA® Collective Communications Library ™ (NCCL) (pronounced "Nickel") is a library of multi-GPU collective communication primitives that are topology-aware and can be easily integrated into applications.

Collective communication algorithms employ many processors working in concert to aggregate data. NCCL is not a full-blown parallel programming framework; rather, it is a library focused on accelerating collective communication primitives. The following collective operations are currently supported:

- ▶ **AllReduce**
- ▶ **Broadcast**
- ▶ **Reduce**
- ▶ **AllGather**
- ▶ **ReduceScatter**

Tight synchronization between communicating processors is a key aspect of collective communication. CUDA® based collectives would traditionally be realized through a combination of CUDA memory copy operations and CUDA kernels for local reductions. NCCL, on the other hand, implements each collective in a single kernel handling both communication and computation operations. This allows for fast synchronization and minimizes the resources needed to reach peak bandwidth.

NCCL conveniently removes the need for developers to optimize their applications for specific machines. NCCL provides fast collectives over multiple GPUs both within and across nodes. It supports a variety of interconnect technologies including PCIe, NVLink™, InfiniBand Verbs, and IP sockets. NCCL also automatically patterns its communication strategy to match the system's underlying GPU interconnect topology.

Next to performance, ease of programming was the primary consideration in the design of NCCL. NCCL uses a simple C API, which can be easily accessed from a variety of programming languages. NCCL closely follows the popular collectives API defined by MPI (Message Passing Interface). Anyone familiar with MPI will thus find NCCL API very natural to use. In a minor departure from MPI, NCCL collectives take a "stream" argument which provides direct integration with the CUDA programming model. Finally, NCCL is compatible with virtually any multi-GPU parallelization model, for example:

- ▶ single-threaded
- ▶ multi-threaded, for example, using one thread per GPU
- ▶ multi-process, for example, MPI combined with multi-threaded operation on GPUs

NCCL has found great application in deep learning frameworks, where the `AllReduce` collective is heavily used for neural network training. Efficient scaling of neural network training is possible with the multi-GPU and multi node communication provided by NCCL.

Chapter 2.
PREREQUISITES

2.1. Software Requirements

Ensure your environment meets the following software requirements:

▶ glibc 2.19 or higher
▶ CUDA 8.0 or higher

2.2. Hardware Requirements

NCCL supports all CUDA devices with a compute capability of 3.0 and higher. For the compute capability of all NVIDIA GPUs, check: CUDA GPUs.

Chapter 3.
INSTALLING NCCL

In order to download NCCL, ensure you are registered for the NVIDIA Developer Program.

1. Go to: NVIDIA NCCL home page.
2. Click **Download**.
3. Complete the short survey and click **Submit**.
4. Accept the Terms and Conditions. A list of available download versions of NCCL displays.
5. Select the NCCL version you want to install. A list of available resources displays. Refer to the following sections to choose the correct package depending on the Linux distribution you are using.

3.1. Ubuntu 14.04 LTS And Ubuntu 16.04 LTS

Installing NCCL on Ubuntu requires you to first add a repository to the APT system containing the NCCL packages, then installing the NCCL packages through APT. There are two repositories available; a local repository and a network repository. Choosing the later is recommended to easily retrieve upgrades when newer versions are posted.

1. Install the repository.

   ▶ For the local NCCL repository:

   ```
   sudo dpkg -i nccl-repo-<version>.deb
   ```
   ▶ For the network repository:

   ```
   sudo dpkg -i nvidia-machine-learning-repo-<version>.deb
   ```
2. Update the APT database:

   ```
   sudo apt update
   ```

3. Install the **`libnccl2`** package with APT. Additionally, if you need to compile applications with NCCL, you can install the **`libnccl-dev`** package as well:

> If you are using the network repository, the following command will upgrade CUDA to the latest version.

```
sudo apt install libnccl2 libnccl-dev
```

If you prefer to keep an older version of CUDA, specify a specific version, for example:

```
sudo apt-get install libnccl2=2.0.0-1+cuda8.0 libnccl-dev=2.0.0-1+cuda8.0
```

Refer to the download page for exact package versions.

3.2. Other Distributions

Download the tar file package. For more information see Installing NCCL.

1. Extract the NCCL package to your home directory or in **`/usr/local`** if installed as root for all users:

```
# cd /usr/local
# tar xvf nccl-<version>.txz
```

2. When compiling applications, specify the directory path to where you installed NCCL, for example **`/usr/local/nccl-<version>/`**.

Chapter 4.
USING NCCL

Using NCCL is similar to using any other library in your code. For example:

1. Install the NCCL library onto your system.

   For more information, see Downloading NCCL.

2. Modify your application to link to that library.

3. Include the header file `nccl.h` in your application.

4. Create a communicator.

   For more information, see *Creating a Communicator* in the NCCL Developer Guide.

5. Familiarize yourself with the NCCL API documentation to maximize your usage performance.

Chapter 5.
MIGRATING FROM NCCL 1 TO NCCL 2

If you are using NCCL 1.x and want to move to NCCL 2.x, be aware that the APIs have changed slightly. NCCL 2.x supports all of the collectives that NCCL 1.x supports, but with slight modifications to the API.

In addition, NCCL 2.x also requires the usage of the Group API when a single thread manages NCCL calls for multiple GPUs.

The following list summarizes the changes that may be required in usage of NCCL API when using an application has a single thread that manages NCCL calls for multiple GPUs, and is ported from NCCL 1.x to 2.x:

Initialization

In 1.x, NCCL had to be initialized using `ncclCommInitAll` at a single thread or having one thread per GPU concurrently call `ncclCommInitRank`. NCCL 2.x retains these two modes of initialization. It adds a new mode with the Group API where `ncclCommInitRank` can be called in a loop, like a communication call, as shown below. The loop has to be guarded by the Group start and stop API.

```
ncclGroupStart();
 for (int i=0; i<ngpus; i++) {
   cudaSetDevice(i);
   ncclCommInitRank(comms+i, ngpus, id, i);
 }
 ncclGroupEnd();
```

Communication

In NCCL 2.x, the collective operation can be initiated for different devices by making calls in a loop, on a single thread. This is similar to the usage in NCCL 1.x. However, this loop has to be guarded by the Group API in 2.x. Unlike in 1.x, the application does not have to select the relevant CUDA device before making the communication API call. NCCL runtime internally selects the device associated with the NCCL communicator handle. For example:

```
ncclGroupStart();
 for (int i=0; i<nLocalDevs; i++) {
```

```
    ncclAllReduce(..., comm[i], stream[i];
 }
 ncclGroupEnd();
```

When using only one device per thread or one device per process, the general usage of API remains unchanged from NCCL 1.x to 2.x. Group API is not required in this case.

Counts

Counts provided as arguments are now of type **size_t** instead of **integer**.

In-place usage for AllGather and ReduceScatter

For more information, see *In-Place Operations* in the NCCL Developer Guide.

AllGather arguments order

The **AllGather** function had its arguments reordered. The prototype changed from:

```
ncclResult_t  ncclAllGather(const void* sendbuff, int count,
 ncclDataType_t datatype,
    void* recvbuff, ncclComm_t comm, cudaStream_t stream);
```

to:

```
ncclResult_t  ncclAllGather(const void* sendbuff, void*
 recvbuff, size_t sendcount,
    ncclDataType_t datatype, ncclComm_t comm, cudaStream_t
 stream);
```

The **recvbuff** argument has been moved after the **sendbuff** argument to be consistent with all the other operations.

Datatypes

New datatypes have been added in NCCL 2.x. The ones present in NCCL 1.x did not change and are still usable in NCCL 2.x.

Error codes

Error codes have been merged into the **ncclInvalidArgument** category and have been simplified. A new **ncclInvalidUsage** code has been created to cover new programming errors.

Chapter 6.
TROUBLESHOOTING

6.1. Support

Register for the NVIDIA Developer Program to report bugs, issues and make requests for feature enhancements. For more information, see: https://developer.nvidia.com/developer-program.
