### 1.1. C++ Samples

You can find the C++ samples in the `/usr/src/tensorrt/samples` package directory as well as on GitHub. The following C++ samples are shipped with TensorRT:

- “Hello World” For TensorRT
- Building A Simple MNIST Network Layer By Layer
- Importing The TensorFlow Model And Running Inference
- “Hello World” For TensorRT From ONNX
- Building And Running GoogleNet In TensorRT
- Building An RNN Network Layer By Layer
- Performing Inference In INT8 Using Custom Calibration
- Performing Inference In INT8 Precision
- Adding A Custom Layer To Your Network In TensorRT
- Object Detection With Faster R-CNN
- Object Detection With A TensorFlow SSD Network
- Movie Recommendation Using Neural Collaborative Filter (NCF)
- Movie Recommendation Using MPS (Multi-Process Service)
- Object Detection With SSD
- “Hello World” For Multilayer Perceptron (MLP)
Introduction

- Specifying I/O Formats Using The Reformat Free I/O APIs
- Adding A Custom Layer That Supports INT8 I/O To Your Network In TensorRT
- Digit Recognition With Dynamic Shapes In TensorRT
- Neural Machine Translation (NMT) Using A Sequence To Sequence (seq2seq) Model
- Object Detection And Instance Segmentation With A TensorFlow Mask R-CNN Network¹
- Object Detection With A TensorFlow Faster R-CNN Network²

Getting Started With C++ Samples

Every C++ sample includes a README.md file in GitHub that provides detailed information about how the sample works, sample code, and step-by-step instructions on how to run and verify its output.

Running C++ Samples on Linux

If you installed TensorRT using the Debian files, copy /usr/src/tensorrt to a new directory first before building the C++ samples. If you installed TensorRT using the tar file, then the samples are located in {TAR_EXTRACT_PATH}/samples. To build all the samples and then run one of the samples, use the following commands:

```
$ cd <samples_dir>
$ make -j4
$ cd ../bin
$ ./<sample_bin>
```

Running C++ Samples on Windows

All of the C++ samples on Windows are provided as Visual Studio Solution files. To build a sample, open its corresponding Visual Studio Solution file and build the solution. The output executable will be generated in (ZIP_EXTRACT_PATH)\bin. You can then run the executable directly or through Visual Studio.

1.2. Python Samples

You can find the Python samples in the /usr/src/tensorrt/samples/python package directory. The following Python samples are shipped with TensorRT.

- Introduction To Importing Caffe, TensorFlow And ONNX Models Into TensorRT Using Python
- “Hello World” For TensorRT Using TensorFlow And Python
- “Hello World” For TensorRT Using PyTorch And Python
- Adding A Custom Layer To Your Caffe Network In TensorRT In Python
- Adding A Custom Layer To Your TensorFlow Network In TensorRT In Python

¹ This sample is located in GitHub only; this is not part of the product package.
² This sample is located in GitHub only; this is not part of the product package.
Getting Started With Python Samples

Every Python sample includes a README.md file. Refer to the /usr/src/tensorrt/samples/python/<sample-name>/README.md file for detailed information about how the sample works, sample code, and step-by-step instructions on how to run and verify its output.

Running Python Samples

To run one of the Python samples, the process typically involves two steps:

1. Install the sample requirements:

   ```
   python<x> -m pip install -r requirements.txt
   ```

   where `python<x>` is either `python2` or `python3`.

2. Run the sample code with the data directory provided if the TensorRT sample data is not in the default location. For example:

   ```
   python<x> sample.py [-d DATA_DIR]
   ```

For more information on running samples, see the README.md file included with the sample.
Chapter 2.
APPLICATION AREAS

The TensorRT samples focus on the following application areas.

**Recommenders**

Recommender systems are used to provide product or media recommendations to users of social networking, media content consumption, and e-commerce platforms. MLP-based Neural Collaborative Filter (NCF) recommenders employ a stack of fully-connected or matrix multiplication layers to generate recommendations.

Some examples of TensorRT recommenders samples include the following:

- Movie Recommendation Using Neural Collaborative Filter (NCF)
- Movie Recommendation Using MPS (Multi-Process Service)
- “Hello World” For Multilayer Perceptron (MLP)

**Machine translation**

Machine translation systems are used to translate text from one language to another language. Recurrent neural networks (RNN) are one of the most popular deep learning solutions for machine translation.

Some examples of TensorRT machine translation samples include the following:

- Neural Machine Translation (NMT) Using A Sequence To Sequence (seq2seq) Model
- Building An RNN Network Layer By Layer

**Character recognition**

Character recognition, especially on the MNIST dataset, is a classic machine learning problem. The MNIST problem involves recognizing the digit that is present in an image of a handwritten digit.

Some examples of TensorRT character recognition samples include the following:

- “Hello World” For TensorRT
Image classification

Image classification is the problem of identifying one or more objects present in an image. Convolutional neural networks (CNN) are a popular choice for solving this problem. They are typically composed of convolution and pooling layers.

Some examples of TensorRT image classification samples include the following:

- Building And Running GoogleNet In TensorRT
- Performing Inference In INT8 Precision
- Introduction To Importing Caffe, TensorFlow And ONNX Models Into TensorRT Using Python

Object detection

Object detection is one of the classic computer vision problems. The task, for a given image, is to detect, classify and localize all objects of interest. For example, imagine that you are developing a self-driving car and you need to do pedestrian detection - the object detection algorithm would then, for a given image, return bounding box coordinates for each pedestrian in an image.

There have been many advances in recent years in designing models for object detection.

Some examples of TensorRT object detection samples include the following:

- Object Detection With SSD In Python
- Object Detection With The ONNX TensorRT Backend In Python
- Object Detection With A TensorFlow SSD Network
- Object Detection With Faster R-CNN
- Object Detection With SSD
- Object Detection And Instance Segmentation With A TensorFlow Mask R-CNN Network
- Object Detection With A TensorFlow Faster R-CNN Network
Chapter 3.
CROSS COMPILING SAMPLES FOR AARCH64 USERS

The following sections show how to cross-compile TensorRT samples for AArch64 QNX, Linux and Android platforms under x86_64 Linux.

3.1. Prerequisites
This section provides step-by-step instructions to ensure you meet the minimum requirements to cross-compile.

1. Install the CUDA cross-platform toolkit for the corresponding target and set the environment variable `CUDA_INSTALL_DIR`.

   ```
   $ export CUDA_INSTALL_DIR="your cuda install dir"
   ```
   
   Where `CUDA_INSTALL_DIR` is set to `/usr/local/cuda` by default.

2. Install the cuDNN cross-platform libraries for the corresponding target and set the environment variable `CUDNN_INSTALL_DIR`.

   ```
   $ export CUDNN_INSTALL_DIR="your cudnn install dir"
   ```
   
   Where `CUDNN_INSTALL_DIR` is set to `CUDA_INSTALL_DIR` by default.

3. Install the TensorRT cross-compilation Debian packages for the corresponding target.

   ```
   If you are using the tar file release for the target platform, then you can safely skip this step. The tar file release already includes the cross-compile libraries so no additional packages are required.
   ```

**QNX AArch64**
- `libnvinfer-dev-cross-qnx`, `libnvinfer5-cross-qnx`

**Linux AArch64**
- `libnvinfer-dev-cross-aarch64`, `libnvinfer5-cross-aarch64`
### Android AArch64

No debian packages are available.

### 3.2. Building Samples For QNX AArch64

This section provides step-by-step instructions to build samples for QNX users.

1. Download the QNX tool-chain and export the following environment variables.

   ```
   $ export QNX_HOST=/path/to/your/qnx/toolchains/host/linux/x86_64
   $ export QNX_TARGET=/path/to/your/qnx/toolchain/target/qnx7
   ```

2. Build the samples by issuing:

   ```
   $ cd /path/to/TensorRT/samples
   $ make TARGET=qnx
   ```

### 3.3. Building Samples For Linux AArch64

This section provides step-by-step instructions to build samples for Linux users.

1. Install the corresponding GCC compiler, `aarch64-linux-gnu-g++`. In Ubuntu, this can be installed via:

   ```
   $ sudo apt-get install g++-aarch64-linux-gnu
   ```

2. Build the samples by issuing:

   ```
   $ cd /path/to/TensorRT/samples
   $ make TARGET=aarch64
   ```

### 3.4. Building Samples For Android AArch64

This section provides step-by-step instructions to build samples for Android users.

2. Create a standalone tool-chain, for example:

   ```
   $NDK/build/tools/make_standalone_toolchain.py \
   --arch arm64 \ 
   --api 26 \ 
   --install-dir=/path/to/my-toolchain
   ```

   You can find more information by visiting: [https://developer.android.com/ndk/guides/standalone_toolchain](https://developer.android.com/ndk/guides/standalone_toolchain)

3. Build the samples by issuing:

   ```
   $ cd /path/to/TensorRT/samples
   $ make TARGET=android64 ANDROID_CC=/path/to/my-toolchain/bin/aarch64-linux-android-clang++
   ```
Chapter 4.
“HELLO WORLD” FOR TENSORRT

This sample, sampleMNIST, is a simple hello world example that performs the basic setup and initialization of TensorRT using the Caffe parser.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleMNIST directory in the GitHub: sampleMNIST repository.

How do I get started?
Refer to the GitHub: sampleMNIST/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
This sample, sampleMNISTAPI, uses the TensorRT API to build an engine for a model trained on the MNIST dataset.

**What does this sample do?**

Specifically, it creates the network layer by layer, sets up weights and inputs/outputs, and then performs inference. This sample is similar to sampleMNIST. Both of these samples use the same model weights, handle the same input, and expect similar output.

**Where is this sample located?**

This sample is maintained under the `samples/opensource/sampleMNISTAPI` directory in the GitHub: sampleMNISTAPI repository.

**How do I get started?**

Refer to the GitHub: sampleMNISTAPI/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
This sample, sampleUffMNIST, imports a TensorFlow model trained on the MNIST dataset.

**What does this sample do?**

The MNIST TensorFlow model has been converted to UFF (Universal Framework Format) using the explanation described in [Working With TensorFlow](#).

The UFF is designed to store neural networks as a graph. The NvUffParser that we use in this sample parses the UFF file in order to create an inference engine based on that neural network.

With TensorRT, you can take a TensorFlow trained model, export it into a UFF protobuf file (.uff) using the UFF converter, and import it using the UFF parser.

**Where is this sample located?**

This sample is maintained under the `samples/opensource/sampleUffMNIST` directory in the [GitHub: sampleUffMNIST](#) repository.

**How do I get started?**

Refer to the [GitHub: sampleUffMNIST/README.md](#) file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 7.
“HELLO WORLD” FOR TENSORRT FROM ONNX

This sample, sampleOnnxMNIST, converts a model trained on the MNIST in Open Neural Network Exchange (ONNX) format to a TensorRT network and runs inference on the network. ONNX is a standard for representing deep learning models that enables models to be transferred between frameworks.

Where is this sample located?

This sample is maintained under the samples/opensource/sampleOnnxMNIST directory in the GitHub: sampleOnnxMNIST repository.

How do I get started?

Refer to the GitHub: sampleOnnxMNIST/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 8.
BUILDING AND RUNNING GOOGLENET IN TENSORRT

This sample, sampleGoogleNet, demonstrates how to import a model trained with Caffe into TensorRT using GoogleNet as an example.

What does this sample do?
Specifically, this sample builds a TensorRT engine from the saved Caffe model, sets input values to the engine, and runs it.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleGoogleNet directory in the GitHub: sampleGoogleNet repository.

How do I get started?
Refer to the GitHub: sampleGoogleNet/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 9.
BUILDING AN RNN NETWORK LAYER BY LAYER

This sample, sampleCharRNN, uses the TensorRT API to build an RNN network layer by layer, sets up weights and inputs/outputs and then performs inference.

What does this sample do?
Specifically, this sample creates a CharRNN network that has been trained on the Tiny Shakespeare dataset. For more information about character level modeling, see char-rnn. TensorFlow has a useful RNN Tutorial which can be used to train a word-level model. Word level models learn a probability distribution over a set of all possible word sequences. Since our goal is to train a char level model, which learns a probability distribution over a set of all possible characters, a few modifications will need to be made to get the TensorFlow sample to work. These modifications can be seen here.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleCharRNN directory in the GitHub: sampleCharRNN repository.

How do I get started?
Refer to the GitHub: sampleCharRNN/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 10. 
PERFORMING INFERENCE IN INT8 USING CUSTOM CALIBRATION

This sample, sampleINT8, performs INT8 calibration and inference.

What does this sample do?

Specifically, this sample demonstrates how to perform inference in an 8-bit integer (INT8). INT8 inference is available only on GPUs with compute capability 6.1 or 7.x. After the network is calibrated for execution in INT8, the output of the calibration is cached to avoid repeating the process. You can then reproduce your own experiments with Caffe in order to validate your results on ImageNet networks.

Where is this sample located?

This sample is maintained under the samples/opensource/sampleINT8 directory in the GitHub: sampleINT8 repository.

How do I get started?

Refer to the GitHub: sampleINT8/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 11.
PERFORMING INFEERENCE IN INT8 PRECISION

This sample, sampleINT8API, performs INT8 inference without using the INT8 calibrator; using the user-provided per activation tensor dynamic range. INT8 inference is available only on GPUs with compute capability 6.1 or 7.x and supports Image Classification ONNX models such as ResNet-50, VGG19, and MobileNet.

What does this sample do?
Specifically, this sample demonstrates how to:

▶ Use `nvinfer1::ITensor::setDynamicRange` to set per tensor dynamic range
▶ Use `nvinfer1::ILayer::setPrecision` to set computation precision of a layer
▶ Use `nvinfer1::ILayer::setOutputType` to set output tensor data type of a layer
▶ Perform INT8 inference without using INT8 calibration

Where is this sample located?
This sample is maintained under the `samples/opensource/sampleINT8API` directory in the GitHub: sampleINT8API repository.

How do I get started?
Refer to the GitHub: sampleINT8API/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 12.
ADDING A CUSTOM LAYER TO YOUR NETWORK IN TENSORRT

This sample, samplePlugin, defines a custom layer that supports multiple data formats and demonstrates how to serialize/deserialize plugin layers. This sample also demonstrates how to use a fully connected plugin (**FCPlugin**) as a custom layer and the integration with NvCaffeParser.

**Where is this sample located?**

This sample is maintained under the samples/opensource/samplePlugin directory in the GitHub: samplePlugin repository.

**How do I get started?**

Refer to the GitHub: samplePlugin/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 13.
OBJECT DETECTION WITH FASTER R-CNN

This sample, sampleFasterRCNN, uses TensorRT plugins, performs inference, and implements a fused custom layer for end-to-end inferencing of a Faster R-CNN model.

What does this sample do?
Specifically, this sample demonstrates the implementation of a Faster R-CNN network in TensorRT, performs a quick performance test in TensorRT, implements a fused custom layer, and constructs the basis for further optimization, for example using INT8 calibration, user trained network, etc. The Faster R-CNN network is based on the paper Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleFasterRCNN directory in the GitHub: sampleFasterRCNN repository.

How do I get started?
Refer to the GitHub: sampleFasterRCNN/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 14.
OBJECT DETECTION WITH A TENSORFLOW SSD NETWORK

This sample, sampleUffSSD, preprocesses a TensorFlow SSD network, performs inference on the SSD network in TensorRT, using TensorRT plugins to speed up inference.

What does this sample do?
This sample is based on the SSD: Single Shot MultiBox Detector paper. The SSD network performs the task of object detection and localization in a single forward pass of the network.

The SSD network used in this sample is based on the TensorFlow implementation of SSD, which actually differs from the original paper, in that it has an inception_v2 backbone. For more information about the actual model, download ssd_inception_v2_coco. The TensorFlow SSD network was trained on the InceptionV2 architecture using the MSCOCO dataset which has 91 classes (including the background class). The config details of the network can be found here.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleUffSSD directory in the GitHub: sampleUffSSD repository.

How do I get started?
Refer to the GitHub: sampleUffSSD/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 15. 
MOVIE RECOMMENDATION USING NEURAL COLLABORATIVE FILTER (NCF)

This sample, sampleMovieLens, is an end-to-end sample that imports a trained TensorFlow model and predicts the highest-rated movie for each user. This sample demonstrates a simple movie recommender system using a multi-layer perceptron (MLP) based Neural Collaborative Filter (NCF) recommender.

What does this sample do?
Specifically, this sample demonstrates how to generate weights for a MovieLens dataset that TensorRT can then accelerate.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleMovieLens directory in the GitHub: sampleMovieLens repository.

How do I get started?
Refer to the GitHub: sampleMovieLens/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 16.
MOVIE RECOMMENDATION USING MPS (MULTI-PROCESS SERVICE)

This sample, sampleMovieLensMPS, is an end-to-end sample that imports a trained TensorFlow model and predicts the highest-rated movie for each user using MPS (Multi-Process Service).

What does this sample do?

MPS allows multiple CUDA processes to share a single GPU context. With MPS, multiple overlapping kernel execution and memcpy operations from different processes can be scheduled concurrently to achieve maximum utilization. This can be especially effective in increasing parallelism for small networks with low resource utilization such as those primarily consisting of a series of small MLPs.

This sample is identical to Movie Recommendation Using Neural Collaborative Filter (NCF) in terms of functionality but is modified to support concurrent execution in multiple processes. Specifically, this sample demonstrates how to generate weights for a MovieLens dataset that TensorRT can then accelerate.

Currently, sampleMovieLensMPS supports only Linux x86-64 (includes Ubuntu and RedHat) desktop users.

Where is this sample located?

This sample is maintained under the samples/opensource/sampleMovieLensMPS directory in the GitHub: sampleMovieLensMPS repository.

How do I get started?

Refer to the GitHub: sampleMovieLensMPS/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 17.
OBJECT DETECTION WITH SSD

This sample, sampleSSD, performs the task of object detection and localization in a single forward pass of the network.

**What does this sample do?**

This sample is based on the [SSD: Single Shot MultiBox Detector](https://arxiv.org/abs/1512.02325) paper. This network is built using the VGG network as a backbone and trained using [PASCAL VOC 2007+ 2012](http://pascalmalcolm.com/voc/) datasets.

Unlike Faster R-CNN, SSD completely eliminates the proposal generation and subsequent pixel or feature resampling stages and encapsulates all computation in a single network. This makes SSD straightforward to integrate into systems that require a detection component.

**Where is this sample located?**

This sample is maintained under the `samples/opensource/sampleSSD` directory in the [GitHub: sampleSSD](https://github.com/nvidia/sampleSSD) repository.

**How do I get started?**

Refer to the [GitHub: sampleSSD/README.md](https://github.com/nvidia/sampleSSD/blob/master/README.md) file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 18.
“HELLO WORLD” FOR MULTILAYER PERCEPTRON (MLP)

This sample, sampleMLP, is a simple hello world example that shows how to create a network that triggers the multilayer perceptron (MLP) optimizer. The generated MLP optimizer can then accelerate TensorRT.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleMLP directory in the GitHub: sampleMLP repository.

How do I get started?
Refer to the GitHub: sampleMLP/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 19.
SPECIFYING I/O FORMATS USING THE REFORMAT FREE I/O APIs

This sample, sampleReformatFreeIO, uses a Caffe model that was trained on the MNIST dataset and performs engine building and inference using TensorRT. The correctness of outputs is then compared to the golden reference.

What does this sample do?
Specifically, this sample shows how to use reformat free I/O APIs to explicitly specify I/O formats to `TensorFormat::kLINEAR`, `TensorFormat::kCHW2` and `TensorFormat::kHWC8` for Float16 and INT8 precision.

`ITensor::setAllowedFormats` is invoked to specify which format is expected to be supported so that the unnecessary reformatting will not be inserted to convert from/to FP32 formats for I/O tensors. `BuilderFlag::kSTRICT_TYPES` is also assigned to the builder configuration to let the builder choose a reformat free path rather than the fastest path.

Where is this sample located?
This sample is maintained under the `samples/opensource/sampleReformatFreeIO` directory in the GitHub: sampleReformatFreeIO repository.

How do I get started?
Refer to the GitHub: sampleReformatFreeIO/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
This sample, sampleUffPluginV2Ext, implements the custom pooling layer for the MNIST model (data/samples/lenet5_custom_pool.uff).

What does this sample do?

Since cuDNN function `cudnnPoolingForward` with float precision is used to simulate an INT8 kernel, the performance for INT8 precision does not speed up. Nevertheless, the main purpose of this sample is to demonstrate how to extend INT8 I/O for a plugin that is introduced in TensorRT 6.0. This requires the interface replacement from `IPlugin/IPluginV2/IPluginV2Ext` to `IPluginV2IOExt` (or `IPluginV2DynamicExt` if dynamic shape is required).

Where is this sample located?

This sample is maintained under the `samples/opensource/sampleUffPluginV2Ext` directory in the GitHub: `sampleUffPluginV2Ext` repository.

How do I get started?

Refer to the GitHub: `/sampleUffPluginV2Ext/README.md` file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 21.
DIGIT RECOGNITION WITH DYNAMIC SHAPES IN TENSORRT

This sample, sampleDynamicReshape, demonstrates how to use dynamic input dimensions in TensorRT by creating an engine for resizing dynamically shaped inputs to the correct size for an ONNX MNIST model.

What does this sample do?
This sample creates an engine for resizing an input with dynamic dimensions to a size that an ONNX MNIST model can consume.

Specifically, this sample demonstrates how to:

‣ Create a network with dynamic input dimensions to act as a preprocessor for the model
‣ Parse an ONNX MNIST model to create a second network
‣ Build engines for both networks
‣ Run inference using both engines

For more information, see Working With Dynamic Shapes in the TensorRT Developer Guide.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleDynamicReshape directory in the GitHub: sampleDynamicReshape repository.

How do I get started?
Refer to the GitHub: sampleDynamicReshape/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 22.
NEURAL MACHINE TRANSLATION (NMT) USING A SEQUENCE TO SEQUENCE (SEQ2SEQ) MODEL

This sample, sampleNMT, demonstrates the implementation of Neural Machine Translation (NMT) based on a TensorFlow seq2seq model using the TensorRT API. The TensorFlow seq2seq model is an open-sourced NMT project that uses deep neural networks to translate text from one language to another language.

What does this sample do?
Specifically, this sample is an end-to-end sample that takes a TensorFlow model, builds an engine, and runs inference using the generated network. The sample is intended to be modular so it can be used as a starting point for your machine translation application.

This sample implements German to English translation using the data that is provided by and trained from the TensorFlow NMT (seq2seq) Tutorial.

Where is this sample located?
This sample is maintained under the samples/opensource/sampleNMT directory in the GitHub: sampleNMT repository.

How do I get started?
Refer to the GitHub: sampleNMT/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
This sample, sampleUffMaskRCNN, performs inference on the Mask R-CNN network in TensorRT.

**What does this sample do?**

Mask R-CNN is based on the Mask R-CNN paper which performs the task of object detection and object mask predictions on a target image.

This sample’s model is based on the Keras implementation of Mask R-CNN and its training framework can be found in the Mask R-CNN Github repository. We have verified that the pre-trained Keras model (with backbone ResNet101 + FPN and dataset coco) provided in the v2.0 release can be converted to UFF and consumed by this sample. And, it is also feasible to deploy your customized Mask R-CNN model trained with specific backbone and datasets.

This sample is available only in GitHub and is not packaged with the product.

This sample makes use of TensorRT plugins to run the Mask R-CNN model. To use these plugins, the Keras model should be converted to Tensorflow .pb model. Then this .pb model needs to be preprocessed and converted to the UFF model with the help of GraphSurgeon and the UFF utility.

**Where is this sample located?**

This sample is maintained under the samples/opensource/sampleUffMaskRCNN directory in the GitHub: sampleUffMaskRCNN repository.
How do I get started?

Refer to the GitHub: sampleUffMaskRCNN/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
This sample, sampleUffFasterRCNN, serves as a demo of how to use the pre-trained Faster-RCNN model in Transfer Learning Toolkit to do inference with TensorRT.

**What does this sample do?**

This sample is a UFF TensorRT sample for Faster-RCNN in NVIDIA Transfer Learning Toolkit SDK. Besides the sample itself, it also provides two TensorRT plugins: Proposal and CropAndResize to implement the proposal layer and ROIpooling layer as custom layers in the model since TensorRT has no native support for them.

This sample is available only in GitHub and is not packaged with the product.

In this sample, we provide a UFF model as a demo. While in the Transfer Learning Toolkit workflow, we can't provide the UFF model. Instead, we can only get the .tlt model during training and the .etlt model after tlt-export. Both of them are encrypted models and the Transfer Learning Toolkit user will use tlt-converter to decrypt the .etlt model and generate a TensorRT engine file in a single step. Therefore, in the Transfer Learning Toolkit workflow, we will consume the TensorRT engine instead of a UFF model. However, this sample can still serve as a demo on how to use the UFF Faster R-CNN model regardless of its format.

**Where is this sample located?**

This sample is maintained under the samples/opensource/sampleUffFasterRCNN directory in the GitHub: sampleUffFasterRCNN repository.
How do I get started?

Refer to the GitHub: sampleUffFasterRCNN/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.
Chapter 25.
INTRODUCTION TO IMPORTING CAFFE, TENSORFLOW AND ONNX MODELS INTO TENSORRT USING PYTHON

This sample, introductory_parser_samples, is a Python sample that uses TensorRT and its included suite of parsers (UFF, Caffe and ONNX parsers), to perform inference with ResNet-50 models trained with various different frameworks.

Where Is This Sample Located?
This sample is installed in the /usr/src/tensorrt/samples/python/introductory_parser_samples directory.

Getting Started:
Refer to the /usr/src/tensorrt/samples/python/introductory_parser_samples/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
Chapter 26.
“HELLO WORLD” FOR TENSORRT USING TENSORFLOW AND PYTHON

This sample, end_to_end_tensorflow_mnist, trains a small, fully-connected model on the MNIST dataset and runs inference using TensorRT.

Where Is This Sample Located?
This sample is installed in the 
/usr/src/tensorrt/samples/python/end_to_end_tensorflow_mnist directory.

Getting Started:
Refer to the 
/usr/src/tensorrt/samples/python/end_to_end_tensorflow_mnist/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
Chapter 27.
“HELLO WORLD” FOR TENSORRT USING PYTORCH AND PYTHON

This sample, network_api_pytorch_mnist, trains a convolutional model on the MNIST dataset and runs inference with a TensorRT engine.

Where Is This Sample Located?
This sample is installed in the /usr/src/tensorrt/samples/python/network_api_pytorch_mnist directory.

Getting Started:
Refer to the /usr/src/tensorrt/samples/python/network_api_pytorch_mnist/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
Chapter 28.
ADDING A CUSTOM LAYER TO YOUR CAFFE NETWORK IN TENSORRT IN PYTHON

This sample, fc_plugin_caffe_mnist, demonstrates how to implement a custom FullyConnected layer using cuBLAS and cuDNN, wraps the implementation in a TensorRT plugin (with a corresponding plugin factory) and generates Python bindings for it using pybind11. These bindings are then used to register the plugin factory with the CaffeParser.

The Caffe InnerProduct/FullyConnected layer is normally handled natively in TensorRT using the IFullyConnected layer. However, in this sample, we use a plugin implementation for instructive purposes.

Where Is This Sample Located?
This sample is installed in the /usr/src/tensorrt/samples/python/fc_plugin_caffe_mnist directory.

Getting started:
Refer to the /usr/src/tensorrt/samples/python/fc_plugin_caffe_mnist/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
This sample, uff_custom_plugin, demonstrates how to use plugins written in C++ with the TensorRT Python bindings and UFF Parser. This sample uses the MNIST dataset.

**Where Is This Sample Located?**
This sample is installed in the `/usr/src/tensorrt/samples/python/uff_custom_plugin` directory.

**Getting Started:**
Refer to the `/usr/src/tensorrt/samples/python/uff_custom_plugin/README.md` file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the `README.md` file is included in this section for your reference, however, you should always refer to the `README.md` within the package for the most recent documentation updates.
Chapter 30.
OBJECT DETECTION WITH THE ONNX TENSORRT BACKEND IN PYTHON

This sample, yolov3_onnx, implements a full ONNX-based pipeline for performing inference with the YOLOv3 network, with an input size of 608x608 pixels, including pre and post-processing.

What Does This Sample Do?
This sample is based on the YOLOv3-608 paper.

This sample is not supported on Ubuntu 14.04 and older. Additionally, the yolov3_to_onnx.py script does not support Python 3.

Where Is This Sample Located?
This sample is installed in the /usr/src/tensorrt/samples/python/yolov3_onnx directory.

Getting Started:
Refer to the /usr/src/tensorrt/samples/python/yolov3_onnx/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
This sample, uff_ssd, implements a full UFF-based pipeline for performing inference with an SSD (InceptionV2 feature extractor) network.

**What Does This Sample Do?**

This sample is based on the [SSD: Single Shot MultiBox Detector](https://arxiv.org/abs/1512.02325) paper. The SSD network, built on the VGG-16 network, performs the task of object detection and localization in a single forward pass of the network. This approach discretizes the output space of bounding boxes into a set of default boxes over different aspect ratios and scales per feature map location. At prediction time, the network generates scores for the presence of each object category in each default box and produces adjustments to the box to better match the object shape. Additionally, the network combines predictions from multiple features with different resolutions to naturally handle objects of various sizes.

This sample is based on the TensorFlow implementation of SSD. For more information, download [ssd_inception_v2_coco](https://github.com/tensorflow/models/tree/master/research/object_detection/samples/configs). Unlike the paper, the TensorFlow SSD network was trained on the InceptionV2 architecture using the MSCOCO dataset which has 91 classes (including the background class). The config details of the network can be found [here](https://github.com/tensorflow/models/tree/master/research/object_detection/samples/configs).

**Where Is This Sample Located?**

This sample is installed in the `/usr/src/tensorrt/samples/python/uff_ssd` directory.

**Getting Started:**

Refer to the `/usr/src/tensorrt/samples/python/uff_ssd/README.md` file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the `README.md` file is included in this section for your reference, however, you should always refer to the `README.md` within the package for the most recent documentation updates.
Chapter 32.
INT8 CALIBRATION IN PYTHON

This sample, int8_caffe_mnist, demonstrates how to create an INT8 calibrator, build and calibrate an engine for INT8 mode, and finally run inference in INT8 mode.

Where Is This Sample Located?
This sample is installed in the /usr/src/tensorrt/samples/python/int8_caffe_mnist directory.

Getting Started:
Refer to the /usr/src/tensorrt/samples/python/int8_caffe_mnist/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
This sample, engine_refit_mnist, trains an MNIST model in PyTorch, recreates the network in TensorRT with dummy weights, and finally refits the TensorRT engine with weights from the model. Refitting allows us to quickly modify the weights in a TensorRT engine without needing to rebuild.

Where Is This Sample Located?
This sample is installed in the /usr/src/tensorrt/samples/python/engine_refit_mnist directory.

Getting Started:
Refer to the /usr/src/tensorrt/samples/python/engine_refit_mnist/README.md file for detailed information about how this sample works, sample code, and step-by-step instructions on how to run and verify its output.

A summary of the README.md file is included in this section for your reference, however, you should always refer to the README.md within the package for the most recent documentation updates.
