Chapter 1.
CUDNN OVERVIEW

NVIDIA cuDNN is a GPU-accelerated library of primitives for deep neural networks. It provides highly tuned implementations of routines arising frequently in DNN applications:

- Convolution forward and backward, including cross-correlation
- Pooling forward and backward
- Softmax forward and backward
- Neuron activations forward and backward:
  - Rectified linear (ReLU)
  - Sigmoid
  - Hyperbolic tangent (TANH)
- Tensor transformation functions
- LRN, LCN and batch normalization forward and backward

cuDNN’s convolution routines aim for performance competitive with the fastest GEMM (matrix multiply) based implementations of such routines while using significantly less memory.

cuDNN features customizable data layouts, supporting flexible dimension ordering, striding, and subregions for the 4D tensors used as inputs and outputs to all of its routines. This flexibility allows easy integration into any neural network implementation and avoids the input/output transposition steps sometimes necessary with GEMM-based convolutions.

cuDNN offers a context-based API that allows for easy multi-threading and (optional) interoperability with CUDA streams.
Chapter 2.
CUDNN RELEASE NOTES V7.2.1

Key Features and Enhancements

The following enhancements have been added to this release:

- The following new functions are added to provide support for the padding mask for the cudnnRNN* family of functions:
  - cudnnSetRNNPaddingMode(): Enables/disables the padded RNN input/output.
  - cudnnGetRNNPaddingMode(): Reads the padding mode status.
  - cudnnCreateRNNDataDescriptor() and cudnnDestroyRNNDataDescriptor(): Creates and destroys, respectively, an RNN data descriptor.
  - cudnnSetRNNDataDescriptor() and cudnnGetRNNDataDescriptor(): Initializes and reads, respectively, the RNN data descriptor.
  - cudnnRNNForwardTrainingEx(): An extended version of the cudnnRNNForwardTraining() to allow for the padded (unpacked) layout for the input/output.
  - cudnnRNNForwardInferenceEx(): An extended version of the cudnnRNNForwardInference() to allow for the padded (unpacked) layout for the input/output.
  - cudnnRNNBackwardDataEx(): An extended version of the cudnnRNNBackwardData() to allow for the padded (unpacked) layout for the input/output.
  - cudnnRNNBackwardWeightsEx(): An extended version of the cudnnRNNBackwardWeights() to allow for the padded (unpacked) layout for the input/output.

- Added support for cell clipping in cuDNN LSTM. The following new functions are added:
  - cudnnRNNSetClip() and cudnnRNNGetClip(): Sets and retrieves, respectively, the LSTM cell clipping mode.
Accelerate your convolution computation with this new feature: When the input channel size $c$ is a multiple of 32, you can use the new data type CUDNN_DATA_INT8x32 to accelerate your convolution computation.

This new data type CUDNN_DATA_INT8x32 is only supported by sm_72.

Enhanced the family of cudnnFindRNN* functions. The findIntensity input to these functions now enable the user to control the overall runtime of the RNN find algorithms, by selecting a percentage of a large Cartesian product space to be searched.

A new mode CUDNN_TENSOR_OP_MATH_ALLOW_CONVERSION is added to cudnnMathType_t. The computation time for FP32 tensors can be reduced by selecting this mode.

The functions cudnnRNNForwardInference(), cudnnRNNForwardTraining(), cudnnRNNBackwardData(), and cudnnRNNBackwardWeights() will now perform down conversion of FP32 input/output only when CUDNN_TENSOR_OP_MATH_ALLOW_CONVERSION is set.

Improved the heuristics for cudnnGet*Algorithm() functions.

Known Issues and Limitations

Following issues and limitations exist in this release:

- For FP16 inputs, the functions cudnnGetConvolutionForwardAlgorithm(), cudnnGetConvolutionBackwardDataAlgorithm(), and cudnnGetConvolutionBackwardFilterAlgorithm() will obtain a slower algorithm.

- For cases where beta is not equal to zero, and when the input channel size is greater than 65535, then the below cudnnConvolutionBackwardFilter() algorithms may return EXECUTION_FAILED error:

  - CUDNN_CONVOLUTION_BWD_FILTER_ALGO_0,
  - CUDNN_CONVOLUTION_BWD_FILTER_ALGO_1, and
  - CUDNN_CONVOLUTION_BWD_FILTER_ALGO_3

  This is a rare occurrence: When beta is not equal to zero, the function cudnnFindConvolutionBackwardFilterAlgorithm() may not return the fastest algorithm available for cudnnConvolutionBackwardFilter().

- Grouped convolutions are not supported in the TRUE_HALF_CONFIG (convDesc is CUDNN_DATA_HALF) data type configuration. As a workaround, the PSEUDO_HALF_CONFIG (convDesc is CUDNN_DATA_FLOAT) data type configuration can be used without losing any precision.

- For the cudnnConvolutionBiasActivationForward() function, if the input cudnnActivationMode_t is set to enum value CUDNN_ACTIVATION_IDENTITY,
then the input cudnnConvolutionFwdAlgo_t must be set to the enum value
CUDNN_CONVOLUTION_FWD_ALGO_IMPLICIT_PRECOMP_GEMM.

- When the user runs cudnnRNNForward* or cudnnRNNBackward* with FP32 input/output, on sm_70 or sm_72, with RNN descriptor’s algo
  field set to CUDNN_RNN_ALGO_PERSIST_STATIC, and math type set to
  CUDNN_TENSOR_OP_MATH via cudnnSetRNNMatrixMathType(), then the results
  are incorrect.
- When the user runs cudnnRNNForward* or cudnnRNNBackward* with FP32 input/output, on sm_70 or sm_72, with RNN descriptor’s
  algo field set to CUDNN_RNN_ALGO_PERSIST_STATIC, and math type set to CUDNN_TENSOR_OP_MATH_ALLOW_CONVERSION via
  cudnnSetRNNMatrixMathType(), then the resulting performance is suboptimal.

Fixed Issues

The following issues have been fixed in this release:

- The cudnnConvolutionBackwardData() function produced incorrect result under
  these conditions:
  - The algo input is set to CUDNN_CONVOLUTION_BWD_DATA_ALGO_1 in
    cudnnConvolutionBwdDataAlgo_t, and
  - CUDNN_TENSOR_OP_MATH is selected.
    Under above conditions, the dgrad computation was giving incorrect results
    when the data is not packed and the data format is NCHW. This is fixed.
- When the cudnnConvolutionFwdAlgo_t() was set to
  CONVOLUTION_FWD_ALGO_FFT_TILING then the function
  cudnnConvolutionForward() was leading to illegal memory access. This is now
  fixed.
- cudnnPoolingBackward() was failing when using a large kernel size used for
  'global_pooling' with NHWC I/O layout. This is fixed.
- The below two items are fixed: If you set RNN mathtype to
  CUDNN_TENSOR_OP_MATH, and run RNN on sm6x or earlier hardware:
  - a. You may have received CUDNN_STATUS_NOT_SUPPORTED
     when algo selected is CUDNN_RNN_ALGO_STANDARD or
     CUDNN_RNN_ALGO_PERSIST_STATIC.
  - b. You may have received incorrect results when algo selected is
     CUDNN_RNN_ALGO_PERSIST_DYNAMIC.
- If you passed in variable sequence length input tensor to
  cudnnRNNForwardInference(), cudnnRNNForwardTraining(),
  cudnnRNNBackwardData(), and used CUDNN_RNN_ALGO_PERSIST_STATIC or
  CUDNN_RNN_ALGO_PERSIST_DYNAMIC, then you may have received incorrect
results. Now this is being checked, and CUDNN_STATUS_NOT_SUPPORTED will be returned.
Chapter 3.
CUDNN RELEASE NOTES V7.1.4

Key Features and Enhancements
The following enhancements have been added to this release:

- Improved performance for some cases of data-gradient convolutions and maxpooling. This is expected to improve performance of ResNet-50 like networks.
- The runtime of the RNN Find algorithm suite is improved in v7.1.4 resulting in slightly improved runtime of cudnnFindRNN***AlgorithmEx.

Known Issues
Following are known issues in this release:

- cudnnGet picks a slow algorithm that does not use Tensor Cores on Volta when inputs are FP16 and it is possible to do so.
- The cudnnConvolutionBackwardFilter() function may output incorrect results for CUDNN_CONVOLUTION_BWD_FILTER_ALGO_FFT_TILING when the convolution mode is CUDNN_CONVOLUTION. This function should not be used in this mode.

Fixed Issues
The following issues have been fixed in this release:

- cudnnAddTensorNd might cause a segmentation fault if called with bad arguments (e.g. null pointer), this issue is in 7.1.3 only and fixed in 7.1.4.
- cudnnRNNBackwardData LSTM cell with fp16 (half) inputs might generate wrong values (silently), this issue exists in cudnn 7.1.3 binaries compiled with cuda toolkit 9.0 and toolkit cuda 9.2, and does not exist in cudnn 7.1.3 binaries compiled with toolkit 9.1.
- cudnnGetRNNLinLayerMatrixParams wrongly returns CUDNN_STATUS_BAD_PARAM when cudnnSetRNNDescriptor is called with dataType == CUDNN_DATA_FLOAT. This is an issue in 7.1.3 only and will be fixed
in 7.1.4. The dataType argument as of today supports only `CUDNN_DATA_FLOAT` and we plan to support additional compute types in the future.

- There is a small memory leak issue when calling `cudnnRNNBackwardData` with `CUDNN_RNN_ALGO_STANDARD`. This issue also affects previous cuDNN v7 releases. This is fixed in 7.1.4.
- RNN with half precision returns `CUDNN_EXECUTION_FAILED` on Kepler gpu in 7.1.3. This is fixed in 7.1.4 to use pseudo-fp16 computation.
- The RNN Find algorithm suite mistakenly did not test `CUDNN_RNN_ALGO_PERSIST_STATIC` and `CUDNN_RNN_ALGO_PERSIST_DYNAMIC` kernels with tensor operations enabled when it was possible to do so. This is fixed in v7.1.4.
Chapter 4.
CUDNN RELEASE NOTES V7.1.3

Known Issues
Following are known issues in this release:

- **cudnnGet** picks a slow algorithm that does not use Tensor Cores on Volta when inputs are FP16 and it is possible to do so.
- The **cudnnConvolutionBackwardFilter()** function may output incorrect results for **CUDNN_CONVOLUTION_BWD_FILTER_ALGO_FFT_TILING** when the convolution mode is CUDNN_CONVOLUTION and the product "n*k" (n - batch size, k - number of output feature maps) is large, i.e., several thousand or more. It appears that the CUDNN_CROSS_CORRELATION mode is not affected by this bug.
- There is a small memory leak issue when calling **cudnnRNNBackwardData** with **CUDNN_RNN_ALGO_STANDARD**. This issue also affects previous cuDNN v7 releases.
- RNN with half precision will not work on Kepler GPUs and will return **CUDNN_EXECUTION_FAILED**. This will be fixed in future releases to return **CUDNN_STATUS_UNSUPPORTED**.

Fixed Issues
The following issues have been fixed in this release:

- **cudnnRNNbackwardData** for LSTM with recurrent projection in half precision may fail in rare cases with misaligned memory access on Pascal and Maxwell.
- **cudnnRNNbackwardData** for bidirectional LSTM with recurrent projection may produce inaccurate results, or **CUDNN_STATUS_UNSUPPORTED**.
- Algo 1 for forward convolution and dgrad may produce erroneous results when the filter size is greater than the input size. This issue is fixed in 7.1.3.
- For very large RNN networks, the function **cudnnGetRNNWorkspaceSize** and **cudnnGetRNNTraining ReserveSize** may internally overflow and give incorrect results.
The small performance regression on multi-layer RNNs using the STANDARD algorithm and Tensor Core math in 7.1.2, as compared to 7.0.5, is fixed in this release.

Fixed an issue with Persistent LSTM backward pass with a hidden state size in the range 257 to 512 on GPUs with number of SMs between 22 and 31 might hang. This issue also exists in 7.1.1. This is fixed in 7.1.3.

Fixed an issue Persistent GRU backward pass with a hidden state size in the range 513->720 on GPUs with exactly 30 SMs would hang. This issue also exists in 7.1.1. This is fixed in 7.1.3.
Chapter 5.
CUDNN RELEASE NOTES V7.1.2

Key Features and Enhancements

The following enhancements have been added to this release:

- RNN search API extended to support all RNN algorithms.
- Newly added projection Layer supported for inference bidirectional RNN cells and for backward data and gradient.
- Support IDENTITY Activation for all cudnnConvolutionBiasActivationForward data types for CUDNN_CONVOLUTION_FWD_ALGO_IMPLICIT_GEMM.
- Added documentation to clarify RNN/LSTM weight formats.

Known Issues

Following are known issues in this release:

- cudnnGet picks a slow algorithm that does not use Tensor Cores on Volta when inputs are FP16 and it is possible to do so.
- There may be a small performance regression on multi-layer RNNs using the STANDARD algorithm with Tensor Core math in this release compared to v7.0.5.
- LSTM projection dgrad half precision may fail in rare cases with misaligned memory access on Pascal and Maxwell.
- Dgrad for bidirectional LSTM with projection should not be used, may produce inaccurate results, or CUDNN_STATUS_UNSUPPORTED.
- The cudnnConvolutionBackwardFilter() function may output incorrect results for CUDNN_CONVOLUTION_BWD_FILTER_ALGO_FFT_TILING when the convolution mode is CUDNN_CONVOLUTION and the product “n*k” (n - batch size, k - number of output feature maps) is large, i.e., several thousand or more. It appears that the CUDNN_CROSS_CORRELATION mode is not affected by this.
Persistent LSTM backward pass with a hidden state size in the range 257 to 512 on GPUs with number of SMs between 22 and 31 might hang. This issue also exists in 7.1.1 and will be fixed in 7.1.3.

Persistent GRU backward pass with a hidden state size in the range 513 to 720 on GPUs with exactly 30 SMs would hang. This issue also exists in 7.1.1 and will be fixed in 7.1.3.

Algo 1 for forward convolution and dgrad may produce erroneous results when the filter size is greater than the input size.

Fixed Issues

The following issues have been fixed in this release:

- The uint8 input for convolution is restricted to Volta and later. We added support for older architectures, for algo: CUDNN_CONVOLUTION_FWD_ALGO_IMPLICIT_GEMM.
- In some cases when algorithm CUDNN_CONVOLUTION_BWD_FILTER_ALGO1 was selected, the routine cudnnConvolutionBackwardFilter could fail at runtime and return CUDNN_STATUS_EXECUTION_FAILED. It now returns CUDNN_STATUS_NOT_SUPPORTED.
- cudnnSetRNNDescriptor no longer needs valid Dropout Descriptor in inference mode, user can pass NULL for Dropout Descriptor in inference mode.
Chapter 6.
CUDNN RELEASE NOTES V7.1.1

Key Features and Enhancements

The following enhancements have been added to this release:

‣ Added new API cudnnSetRNNProjectionLayers and cudnnGetRNNProjectionLayers to support Projection Layer for the RNN LSTM cell. In this release only the inference use case will be supported. The bi-directional and the training forward and backward for training is not supported in 7.1.1 but will be supported in the upcoming 7.1.2 release without API changes. For all the unsupported cases in this release, CUDNN_NOT_SUPPORTED is returned when projection layer is set and the RNN is called.

‣ The cudnnGetRNNLinLayerMatrixParams() function was enhanced and a bug was fixed without modifying its prototype. Specifically:

‣ The cudnnGetRNNLinLayerMatrixParams() function was updated to support the RNN projection feature. An extra linLayerID value of 8 can be used to retrieve the address and the size of the “recurrent” projection weight matrix when "mode" in cudnnSetRNNDescriptor() is configured to CUDNN_LSTM and the recurrent projection is enabled via cudnnSetRNNProjectionLayers().

‣ Instead of reporting the total number of elements in each weight matrix in the “linLayerMatDesc” filter descriptor, the cudnnGetRNNLinLayerMatrixParams() function returns the matrix size as two dimensions: rows and columns. This allows the user to easily print and initialize RNN weight matrices. Elements in each weight matrix are arranged in the row-major order. Due to historical reasons, the minimum number of dimensions in the filter descriptor is three. In previous versions of the cuDNN library, cudnnGetRNNLinLayerMatrixParams() returned the total number of weights as follows: filterDimA[0]=total_size, filterDimA[1]=1, filterDimA[2]=1. In v7.1.1, the format was changed to: filterDimA[0]=1, filterDimA[1]=rows, filterDimA[2]=columns. In both cases, the
"format" field of the filter descriptor should be ignored when retrieved by `cudnnGetFilterNdDescriptor()`.

- A bug in `cudnnGetRNNLinLayerMatrixParams()` was fixed to return a zeroed filter descriptor when the corresponding weight matrix does not exist. This occurs, for example, for linLayerID values of 0-3 when the first RNN layer is configured to exclude matrix multiplications applied to RNN input data (inputMode=CUDNN_SKIP_INPUT in `cudnnSetRNNDescriptor()` specifies implicit, fixed identity weight matrices for RNN input). Such cases in previous versions of the cuDNN library caused `cudnnGetRNNLinLayerMatrixParams()` to return corrupted filter descriptors with some entries from the previous call. A workaround was to create a new filter descriptor for every invocation of `cudnnGetRNNLinLayerMatrixParams()`.

- The `cudnnGetRNNLinLayerBiasParams()` function was updated to report the bias column vectors in "linLayerBiasDesc" in the same format as `cudnnGetRNNLinLayerMatrixParams()`. In previous versions of the cuDNN library, `cudnnGetRNNLinLayerBiasParams()` returned the total number of adjustable bias parameters as follows: filterDimA[0]=total_size, filterDimA[1]=1, filterDimA[2]=1. In v7.1.1, the format was changed to: filterDimA[0]=1, filterDimA[1]=rows, filterDimA[2]=1 (number of columns). In both cases, the "format" field of the filter descriptor should be ignored when retrieved by `cudnnGetFilterNdDescriptor()`.

- Added support for use of Tensor Core for the CUDNN_RNN_ALGO_PERSIST_STATIC. This required cuda cuDNN v7.1 build with CUDA 9.1 and 387 or higher driver. It will not work with CUDA 9.0 and 384 driver.

- Added RNN search API that allows the application to provide an RNN descriptor and get a list of possible algorithm choices with performance and memory usage, to allow applications to choose between different implementations. For more information, refer to the documentation of: `cudnnFindRNNForwardInferenceAlgorithmEx`, `cudnnFindRNNForwardTrainingAlgorithmEx`, `cudnnFindRNNBackwardDataAlgorithmEx`, and `cudnnFindRNNBackwardWeightsAlgorithmEx`. In this release, the search will operate on STANDARD algorithm and will not support PERSISTENT algorithms of RNN.

- Added uint8 for support for the input data for `cudnnConvolutionBiasActivationForward` and `cudnnConvolutionForward`. Currently the support is on Volta (sm 70) and later architectures. Support for older architectures will be gradually added in the upcoming releases.
Suport for CUDNN_ACTIVATION_IDENTITY is added to `cudnnConvolutionBiasActivationForward`. This allows users to perform Convolution and Bias without Activation.

All API functions now support logging. User can trigger logging by setting environment variable “CUDNN_LOGINFO_DBG=1” and “CUDNN_LOGDEST_DBG= <option>” where <option> (i.e., the output destination of the log) can be chosen from “stdout”, “stderr”, or a file path. User may also use the new Set/GetCallBack functions to install their customized callback function. Log files can be added to the reported bugs or shared with us for analysis and future optimizations through partners.nvidia.com.

Improved performance of 3D convolution on Volta architecture.

The following algo-related functions have been added for this release: `cudnnGetAlgorithmSpaceSize`, `cudnnSaveAlgorithm`, `cudnnRestoreAlgorithm`, `cudnnCreateAlgorithmDescriptor`, `cudnnSetAlgorithmDescriptor`, `cudnnGetAlgorithmDescriptor`, `cudnnCreateAlgorithmPerformance`, `cudnnSetAlgorithmPerformance`, `cudnnGetAlgorithmPerformance`, `cudnnDestroyAlgorithmPerformance`.

All algorithms for convolutions now support groupCount > 1. This includes `cudnnConvolutionForward()`, `cudnnConvolutionBackwardData()`, and `cudnnConvolutionBackwardFilter()`.

**Known Issues**

Following are known issues in this release:

- RNN search Algorithm is restricted to STANDARD algorithm.
- Newly added projection Layer supported for inference and one directional RNN cells.
- uint8 input for convolution is restricted to Volta and later.
- `cudnnGet` picks a slow algorithm that doesn't use Tensor Cores on Volta when inputs are FP16 and it is possible to do so.
- There may be a small performance regression on multi-layer RNNs using the STANDARD algorithm with Tensor Core math in this release compared to 7.0.5.

**Fixed Issues**

The following issues have been fixed in this release:

- 3D convolution performance improvements for Volta.
- Added support for Algorithm 0 data gradients to cover cases previously not supported.
- Removed the requirement for dropout Descriptor in RNN inference. Before application had to set a non point for the dropout Descriptor which was not used.
Use of CUDNN_TENSOR_NCHW_VECT_C with non-zero padding resulted in a return status of CUDNN_STATUS_INTERNAL_ERROR. This issue is now fixed.
Chapter 7.
CUDNN RELEASE NOTES V7.0.5

Key Features and Enhancements

The following enhancements have been added to this release:

- None.

Known Issues

Following are known issues in this release:

- cuDNN library may trigger a CPU floating point exception when FP exceptions are enabled by user. This issue exists for all 7.0.x releases.

- There are heavy use cases of RNN layers that might hit a memory allocation issue in the CUDA driver when using cuDNN v7 with CUDA 8.0 and R375 driver on pre-Pascal architectures (Kepler and Maxwell). In these cases, subsequent CUDA kernels may fail to launch with an Error Code 30. To resolve the issue, it is recommended to use the latest R384 driver (from NVIDIA driver downloads) or to ensure that the persistence daemon is started. This behavior is observed on all 7.0.x releases.

- When using TENSOR_OP_MATH mode with `cudnnConvolutionBiasActivationForward`, the pointer to the bias must be aligned to 16 bytes and the size of allocated memory must be multiples of 256 elements. This behavior exists for all 7.0.x releases.

Fixed Issues

The following issues have been fixed in this release:

- Corrected the algorithm fallback behavior in RNN when user set to use `CUDNN_TENSOR_OP_MATH` when using compute card without HMMA. Instead of returning `CUDNN_STATUS_NOT_SUPPORTED`, the RNN algorithm will now continue to run using `CUDNN_DEFAULT_MATH`. The correct behavior is to fall back to using default math when Tensor Core is not supported. Fixed to the expected behavior.
On Volta hardware, \texttt{BWD\_FILTER\_ALGO\_1} and \texttt{BWD\_DATA\_ALGO\_1} convolutions using a number of filter elements greater than 512 were causing \texttt{CUDA\_ERROR\_ILLEGAL\_ADDRESS} and \texttt{CUDNN\_STATUS\_INTERNAL\_ERROR} errors. Logic was added to fall back to a generic kernel for these filter sizes.

cuDNN v7 with CUDA 8.0 produced erroneous results on Volta for some common cases of Algo 1. Logic was added to fall back to a generic kernel when cudnn v7 with CUDA 8.0 is used on Volta.
Chapter 8.
CUDNN RELEASE NOTES V7.0.4

Key Features and Enhancements

Performance improvements for grouped convolutions when input channels and output channels per group are 1, 2, or 4 for the following algorithms:

- CUDNN_CONVOLUTION_FWD_ALGO_IMPLICIT_GEMM
- CUDNN_CONVOLUTION_BWD_DATA_ALGO0
- CUDNN_CONVOLUTION_BWD_DATA_ALGO_1
- CUDNN_CONVOLUTION_BWD_FILTER_ALGO_0
- CUDNN_CONVOLUTION_BWD_FILTER_ALGO_1

Known Issues

Following are known issues in this release:

- The CUDA 8.0 build of cuDNN may produce incorrect computations when run on Volta.
- cuDNN library triggers CPU floating point exception when FP exceptions are enabled by user. This issue exists for all 7.0.x releases.
- There are heavy use cases of RNN layers that might hit a memory allocation issue in the CUDA driver when using cuDNN v7 with CUDA 8.0 and R375 driver on pre-Pascal architectures (Kepler and Maxwell). In these cases, subsequent CUDA kernels may fail to launch with an Error Code 30. To resolve the issue, it is recommended to use the latest R384 driver (from NVIDIA driver downloads) or to ensure that the persistence daemon is started. This behavior is observed on all 7.0.x releases.
- When using TENSOR_OP_MATH mode with cudnnConvolutionBiasActivationForward, the pointer to the bias must be aligned to 16 bytes and the size of allocated memory must be multiples of 256 elements. This behavior exists for all 7.0.x releases.
Fixed Issues

The following issues have been fixed in this release:

- Fixed out-of-band global memory accesses in the 256-point 1D FFT kernel. The problem affected convolutions with 1x1 filters and tall but narrow images, e.g., 1x500 (WxH). In those cases, the workspace size for the `FFT_TILING` algo was computed incorrectly. There was no error in the FFT kernel.

- Eliminated a source of floating point exceptions in the `CUDNN_CONVOLUTION_FWD_ALGO_WINOGRAD_NONFUSED` algorithm. The host code to generate a negative infinity floating point value was substituted with a different logic. By default, FP exceptions are disabled. However, a user program enabled them by invoking `feenableexcept()`. There are at least two other sources of FP exceptions in the cuDNN library, affecting for example `BATCHNORM_SPATIAL_PERSISTENT`. Those sources of FP exceptions will be eliminated in future releases of the cuDNN library.
Chapter 9.
CUDNN RELEASE NOTES V7.0.3

Key Features and Enhancements

Performance improvements for various cases:

‣ Forward Grouped Convolutions where input channel per groups is 1, 2 or 4 and hardware is Volta or Pascal.
‣ `cudnnTransformTensor()` where input and output tensor is packed.

This is an improved fallback, improvements will not be seen in all cases.

Known Issues

The following are known issues in this release:

‣ `CUDNN_CONVOLUTION_FWD_ALGO_FFT_TILING` may cause `CUDA_ERROR_ILLEGAL_ADDRESS`. This issue affects input images of just one 1 pixel in width and certain $n$, $c$, $k$, $h$ combinations.

Fixed Issues

The following issues have been fixed in this release:

‣ `AddTensor` and `TensorOp` produce incorrect results for half and INT8 inputs for various use cases.
‣ `cudnnPoolingBackward()` can produce incorrect values for rare cases of non-deterministic MAX pooling with `window_width > 256`. These rare cases are when the maximum element in a window is duplicated horizontally (along width) by a stride of $256 \times k$ for some $k$. The behavior is now fixed to accumulate derivatives for the duplicate that is left-most.
‣ `cudnnGetConvolutionForwardWorkspaceSize()` produces incorrect workspace size for algorithm `FFT_TILING` for 1d convolutions. This only occurs for large sized
convolutions where intermediate calculations produce values greater than $2^{31}$ (2 to the power of 31).

- **CUDNN_STATUS_NOT_SUPPORTED** returned by `cudnnPooling` functions for small image (channels * height * width < 4).
Chapter 10.
CUDNN RELEASE NOTES V7.0.2

Key Features and Enhancements
This is a patch release of cuDNN 7.0 and includes bug fixes and performance improvements mainly on Volta.

Algo 1 Convolutions Performance Improvements
Performance improvements were made to CUDNN_CONVOLUTION_FWD_ALGO_IMPLICIT_PRECOMP_GEMM, CUDNN_CONVOLUTION_BWD_FILTER_ALGO_1, and CUDNN_CONVOLUTION_BWD_DATA_ALGO_1. These improvements consist of new SASS kernels and improved heuristics. The new kernels implement convolutions over various data sizes and tile sizes. The improved heuristics take advantage of these new kernels.

Known Issues
The following are known issues in this release:

- cudnnGetConvolutionForwardWorkspaceSize() returns overflowed size_t value for certain input shape for CUDNN_CONVOLUTION_*_ALGO_FFT_TILING.
- cudnnPoolingBackward() fails for pooling window size > 256.

Fixed Issues
The following issues have been fixed in this release:

- Batch Norm CUDNN_BATCHNORM_SPATIAL_PERSISTENT might get into race conditions in certain scenarios.
- cuDNN convolution layers using TENSOR_OP_MATH with fp16 inputs and outputs and fp32 compute will use “round to nearest” mode instead of “round to zero” mode as in 7.0.1. This rounding mode has proven to achieve better results in training.
Fixed synchronization logic in the CUDNN_CTC_LOSS_ALGO_DETERMINISTIC algo for CTC. The original code would hang in rare cases.

Convolution algorithms using TENSOR_OP_MATH returned a workspace size from *GetWorkspaceSize() smaller than actually necessary.

The results of int8 are inaccurate in certain cases when calling cudnnConvolutionForward() in convolution layer.

cudnnConvolutionForward() called with xDesc’s channel = yDesc’s channel = groupCount could compute incorrect values when vertical padding > 0.
cuDNN v7.0.1 is the first release to support the Volta GPU architecture. In addition, cuDNN v7.0.1 brings new layers, grouped convolutions, and improved convolution find as error query mechanism.

Key Features and Enhancements
This cuDNN release includes the following key features and enhancements.

Tensor Cores
Version 7.0.1 of cuDNN is the first to support the Tensor Core operations in its implementation. Tensor Cores provide highly optimized matrix multiplication building blocks that do not have an equivalent numerical behavior in the traditional instructions, therefore, its numerical behavior is slightly different.

cudnnSetConvolutionMathType, cudnnSetRNNMatrixMathType, and cudnnMathType_t
The cudnnSetConvolutionMathType and cudnnSetRNNMatrixMathType functions enable you to choose whether or not to use Tensor Core operations in the convolution and RNN layers respectively by setting the math mode to either CUDNN_TENSOR_OP_MATH or CUDNN_DEFAULT_MATH.

Tensor Core operations perform parallel floating point accumulation of multiple floating point products.

Setting the math mode to CUDNN_TENSOR_OP_MATH indicates that the library will use Tensor Core operations.

The default is CUDNN_DEFAULT_MATH. This default indicates that the Tensor Core operations will be avoided by the library. The default mode is a serialized operation
whereas, the Tensor Core is a parallelized operation, therefore, the two might result in slightly different numerical results due to the different sequencing of operations.

The library falls back to the default math mode when Tensor Core operations are not supported or not permitted.

**cudnnSetConvolutionGroupCount**
A new interface that allows applications to perform convolution groups in the convolution layers in a single API call.

**cudnnCTCLoss**
cudnnCTCLoss provides a GPU implementation of the Connectionist Temporal Classification (CTC) loss function for RNNs. The CTC loss function is used for phoneme recognition in speech and handwriting recognition.

**CUDNN_BATCHNORM_SPATIAL_PERSISTENT**
The CUDNN_BATCHNORM_SPATIAL_PERSISTENT function is a new batch normalization mode for cudnnBatchNormalizationForwardTraining and cudnnBatchNormalizationBackward. This mode is similar to CUDNN_BATCHNORM_SPATIAL, however, it can be faster for some tasks.

**cudnnQueryRuntimeError**
The cudnnQueryRuntimeError function reports error codes written by GPU kernels when executing cudnnBatchNormalizationForwardTraining and cudnnBatchNormalizationBackward with the CUDNN_BATCHNORM_SPATIAL_PERSISTENT mode.

**cudnnGetConvolutionForwardAlgorithm_v7**
This new API returns all algorithms sorted by expected performance (using internal heuristics). These algorithms are output similarly to cudnnFindConvolutionForwardAlgorithm.

**cudnnGetConvolutionBackwardDataAlgorithm_v7**
This new API returns all algorithms sorted by expected performance (using internal heuristics). These algorithms are output similarly to cudnnFindConvolutionBackwardAlgorithm.

**cudnnGetConvolutionBackwardFilterAlgorithm_v7**
This new API returns all algorithms sorted by expected performance (using internal heuristics). These algorithms are output similarly to cudnnFindConvolutionBackwardFilterAlgorithm.

**CUDNN_REDUCE_TENSOR_MUL_NO_ZEROS**
The MUL_NO_ZEROS function is a multiplication reduction that ignores zeros in the data.
**CUDNN_OP_TENSOR_NOT**

The `OP_TENSOR_NOT` function is a unary operation that takes the negative of \((\alpha A)\).

**cudnnGetDropoutDescriptor**

The `cudnnGetDropoutDescriptor` function allows applications to get dropout values.

**Using cuDNN v7.0.1**

Ensure you are familiar with the following notes when using this release.

- Multi-threading behavior has been modified. Multi-threading is allowed only when using different cuDNN handles in different threads.
- In `cudnnConvolutionBackwardFilter`, dilated convolution did not support cases where the product of all filter dimensions was odd for half precision floating point. These are now supported by `CUDNN_CONVOLUTION_BWD_FILTER_ALGO1`.
- Fixed bug that produced a silent computation error for when a batch size was larger than 65536 for `CUDNN_CONVOLUTION_FWD_ALGO_IMPLICIT_PRECOMP_GEMM`.
- In `getConvolutionForwardAlgorithm`, an error was not correctly reported in v5 when the output size was larger than expected. In v6 the `CUDNN_STATUS_NOT_SUPPORTED`, error message displayed. In v7, this error is modified to `CUDNN_STATUS_BAD_PARAM`.
- In `cudnnConvolutionBackwardFilter`, cuDNN now runs some exceptional cases correctly where it previously erroneously returned `CUDNN_STATUS_NOT_SUPPORTED`. This impacted the algorithms `CUDNN_CONVOLUTION_BWD_FILTER_ALGO0` and `CUDNN_CONVOLUTION_BWD_FILTER_ALGO3`.

**Deprecated Features**

The following routines have been removed:

- `cudnnSetConvolution2dDescriptor_v4`
- `cudnnSetConvolution2dDescriptor_v5`
- `cudnnGetConvolution2dDescriptor_v4`
- `cudnnGetConvolution2dDescriptor_v5`

Only the non-suffixed versions of these routines remain.

The following routines have been created and have the same API prototype as their non-suffixed equivalent from cuDNN v6:
•  cudnnSetRNNDescriptor_v5 - The non-suffixed version of the routines in cuDNN v7.0.1 are now mapped to their _v6 equivalent.

  **Attention** It is strongly advised to use the non-suffixed version as the _v5 and _v6 routines will be removed in the next cuDNN release.

•  cudnnGetConvolutionForwardAlgorithm, cudnnGetConvolutionBackwardDataAlgorithm, and cudnnGetConvolutionBackwardFilterAlgorithm - A _v7 version of this routine has been created. For more information, see the Backward compatibility and deprecation policy chapter of the cuDNN documentation for details.

**Known Issues**

•  cuDNN pooling backwards fails for pooling window size > 256.
Notice

THE INFORMATION IN THIS GUIDE AND ALL OTHER INFORMATION CONTAINED IN NVIDIA DOCUMENTATION REFERENCED IN THIS GUIDE IS PROVIDED “AS IS.” NVIDIA MAKES NO WARRANTIES, EXPRESSED, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE INFORMATION FOR THE PRODUCT, AND EXPRESSLY DISCLAIMS ALL IMPLIED WARRANTIES OF NONINFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE. Notwithstanding any damages that customer might incur for any reason whatsoever, NVIDIA's aggregate and cumulative liability towards customer for the product described in this guide shall be limited in accordance with the NVIDIA terms and conditions of sale for the product.

THE NVIDIA PRODUCT DESCRIBED IN THIS GUIDE IS NOT FAULT TOLERANT AND IS NOT DESIGNED, MANUFACTURED OR INTENDED FOR USE IN CONNECTION WITH THE DESIGN, CONSTRUCTION, MAINTENANCE, AND/OR OPERATION OF ANY SYSTEM WHERE THE USE OR A FAILURE OF SUCH SYSTEM COULD RESULT IN A SITUATION THAT THREATENS THE SAFETY OF HUMAN LIFE OR SEVERE PHYSICAL HARM OR PROPERTY DAMAGE (INCLUDING, FOR EXAMPLE, USE IN CONNECTION WITH ANY NUCLEAR, AVIONICS, LIFE SUPPORT OR OTHER LIFE CRITICAL APPLICATION). NVIDIA EXPRESSLY DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY OF FITNESS FOR SUCH HIGH RISK USES. NVIDIA SHALL NOT BE LIABLE TO CUSTOMER OR ANY THIRD PARTY, IN WHOLE OR IN PART, FOR ANY CLAIMS OR DAMAGES ARISING FROM SUCH HIGH RISK USES.

NVIDIA makes no representation or warranty that the product described in this guide will be suitable for any specified use without further testing or modification. Testing of all parameters of each product is not necessarily performed by NVIDIA. It is customer’s sole responsibility to ensure the product is suitable and fit for the application planned by customer and to do the necessary testing for the application in order to avoid a default of the application or the product. Weaknesses in customer’s product designs may affect the quality and reliability of the NVIDIA product and may result in additional or different conditions and/or requirements beyond those contained in this guide. NVIDIA does not accept any liability related to any default, damage, costs or problem which may be based on or attributable to: (i) the use of the NVIDIA product in any manner that is contrary to this guide, or (ii) customer product designs.

Other than the right for customer to use the information in this guide with the product, no other license, either expressed or implied, is hereby granted by NVIDIA under this guide. Reproduction of information in this guide is permissible only if reproduction is approved by NVIDIA in writing, is reproduced without alteration, and is accompanied by all associated conditions, limitations, and notices.
