Chapter 1. Introduction

The NVIDIA® DGX™ systems are shipped with DGX™ OS which incorporates the NVIDIA DGX software stack built upon the Ubuntu Linux distribution. Instead of running the Ubuntu distribution, you can run Red Hat Enterprise Linux on the DGX system and still take advantage of the advanced DGX features.

This document explains how to install and configure the NVIDIA DGX software stack on DGX systems installed with Red Hat Enterprise Linux.

Note: While it may be possible to use other derived Linux distributions besides Red Hat Enterprise Linux, not all have been tested and qualified by NVIDIA. Refer to the DGX Software for Red Hat Enterprise Linux 8 Release Notes for the list of tested and qualified software and Linux distributions.

1.1. Related Documentation

- NVIDIA DGX Software for Red Hat Enterprise Linux 8 - Release Notes
- NVIDIA DGX-1 User Guide
- NVIDIA DGX-2 User Guide
- NVIDIA DGX A100 User Guide
- NVIDIA DGX Station User Guide

1.2. Prerequisites

The following are required (or recommended where indicated).

1.2.1. Red Hat Subscription

You need a Red Hat subscription if you plan to install and use Red Hat Enterprise Linux 8 on the DGX. A subscription also lets you obtain update packages and additional packages for
Red Hat Enterprise Linux. You can either purchase a subscription or obtain a free evaluation subscription from the Red Hat Software & Download Center.

Note: Of the available Red Hat Enterprise Linux platforms, only Red Hat Enterprise Linux Server is supported on DGX systems (DGX servers and DGX Station workstation). Other Red Hat Enterprise Linux platforms are not supported on any DGX system.

1.2.2. Access to Repositories

The repositories can be accessed from the internet.

If your installation does not allow connection to the internet, see the section Installing Software on Air-Gapped NVIDIA DGX Systems for information about updating software on “air-gapped” systems.

If you are using a proxy server, then follow the instructions in the section Configuring a System Proxy to make sure the system can access the necessary URIs.

1.2.2.1. NVIDIA Repositories

After installing Red Hat Enterprise Linux on the DGX system, you must enable the NVIDIA DGX software repository (https://repo.download.nvidia.com). The repository includes the NVIDIA drivers and software for supporting DGX systems.

See the section Enabling the Repositories for instructions on how to enable the repository.

1.2.2.2. Red Hat Repositories

Installation of the DGX Software over Red Hat Enterprise Linux 8 requires access to several additional repositories.

- Red Hat Enterprise BaseOS Repository: rhel-8-for-x86_64-baseos-rpms
- Red Hat Enterprise AppStream Repository: rhel-8-for-x86_64-appstream-rpms
- Red Hat Enterprise CodeReady Linux Builder Repository: codeready-builder-for-rhel-8-x86_64-debug-rpms

1.2.3. Network File System

On DGX servers, the data drives are meant to be used as a cache. DGX Station users can follow the same usage, or can alternatively opt to use these drives for storage. When using the data drives as cache, a network file system (NFS) is recommended to take advantage of the cache file system provided by the DGX software stack.

1.2.4. BMC Password

The DGX BMC comes with default login credentials as specified in Appendix B: Changing the BMC Login.
NVIDIA recommends disabling the default username and creating a unique BMC username and strong password as soon as possible. Refer to Appendix B: Changing the BMC Login for instructions.
Chapter 2. Installing Red Hat Enterprise Linux 8

There are several methods for installing Red Hat Enterprise Linux as described in the Red Hat Enterprise Linux Installation Guide [https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html/installation_guide/index].

See the DGX Software for Red Hat Enterprise Linux Release Notes for the version of Red Hat Enterprise Linux 8 that is qualified and tested for use with the DGX software.

For convenience, this section describes how to install Red Hat Enterprise Linux using the Quick Install method, and shows when to reclaim disk space in the process. It describes a minimal installation. If you have a preferred method for installing Red Hat Enterprise Linux, then you can skip this section but be sure to reclaim disk space occupied by the existing Ubuntu installation.

The interactive method described here installs Red Hat Enterprise Linux on DGX using a connected monitor and keyboard and USB stick with the ISO image, or remotely through the remote console of the BMC.

2.1. Obtaining Red Hat Enterprise Linux 8

Important: Refer to the release notes for any critical information regarding supported releases or dependencies.

2.2. Booting Red Hat Enterprise Linux 8 ISO Locally

1. Plug the USB flash drive containing the Red Hat Enterprise Linux 8 ISO image into the DGX.
2. Connect a monitor and keyboard directly to the DGX.
3. Boot the system and press F11 when the NVIDIA logo appears to get to the boot menu.
4. Select the USB volume name that corresponds to the inserted USB flash drive, and boot the system from it.
5. Follow the instructions at Installing Red Hat Enterprise Linux

2.3. Booting the Red Hat Enterprise Linux 8 ISO Remotely

Skip this chapter if you are using a monitor and keyboard for installing locally, or if you are installing on a DGX Station. The DGX Station cannot be booted remotely.

2.3.1. Booting the ISO Image on the DGX-1 Remotely

Skip this chapter if you are using a monitor and keyboard for installing locally.

▶ For instructions applicable to the NVIDIA DGX-2 or DGX A100, see Booting the ISO Image on the DGX-2 or DGX A100 Remotely

1. Connect to the BMC and change user privileges.
   a). Open a Java-enabled web browser within your LAN and go to http://<BMC-ip-address>/, then log in.
      
      Use Firefox or Internet Explorer. Google Chrome is not officially supported by the BMC.

   b). From the top menu, click Configuration and then select Users.
   c). Select the user name that you created for the BMC, then click Modify User.
   d). In the Modify User dialog, select the VMedia checkbox to add it to the extended privileges for the user, then click Modify.
2. Set up the ISO image as virtual media and reboot the system.
   a). From the top menu, click **Remote Control** and select **Remote KVM**.

   b). Click **Launch KVM** to open the remote console.
   c). From the top menu bar in the KVM window, click **Browse File** and select the ISO image, then click **Start Media**.

   The CD image should now be connected.

   d). From the top menu bar in the KVM window, click **Power** and then select **Reset Server**.

3. Boot the CD ROM image.
Typically, the default boot order does not boot the CDROM image. This can be changed in the BIOS or as a one-time option in the boot menu. To bring up the boot menu, press F11 at the beginning of the boot process. Pressing \textbf{F11} will display Show Boot Options at the top of the virtual display before entering the boot menu. Use the ‘soft’ keyboard (Menu \rightarrow Keyboard Layout \rightarrow SoftKeyboard \rightarrow \texttt{<Language>}) to bring up a virtual keyboard if pressing the physical key has no effect.

\begin{itemize}
\item[a)] In the boot menu, select \texttt{UEFI: AMI Virtual CDROM 1.00} as the boot device and then press \texttt{ENTER}.
\item[b)] Follow the instructions at \texttt{Installing Red Hat Enterprise Linux}.
\end{itemize}
2.3.2. **Booting the ISO Image on the DGX-2 or DGX A100 Remotely**

Skip this chapter if you are using a monitor and keyboard for installing locally.

1. Connect to the BMC and ensure the required user privileges are set.
   a). Open a browser within your LAN and go to https://<BMC-ip-address>/, then log in.
   b). From the left-side menu, click **Settings** and then select **User Management**.
   c). Click the card with the user name that you created for the BMC.
   d). In the **User Management Configuration** dialog, make sure the **VMedia Access** checkbox is selected, then click **Save**.

2. Set up the ISO image as virtual media.
   a). From the left-side menu, click **Remote Control**.
b). Select **Launch KVM**.

c). From the top menu bar in the KVM window, click **Browse File** and select the ISO image, then click **Start Media**.
The CD image should now be connected.

d). From the top menu bar in the KVM window, click **Power** and then select **Reset Server**.

3. Boot from the virtual media.

Typically, the default boot order does not boot the CDROM image. You can change this in the BIOS or as a one-time option in the boot menu.

a). To bring up the boot menu, press **F11** at the beginning of the boot process.

Pressing **F11** will display **Entering Boot Menu** in the virtual display before entering the boot menu.

b). In the boot menu, select **UEFI: AMI Virtual CDROM0 1.00** as the boot device and then press **ENTER**.
If you are booting from the DGX-2, the boot device is labeled **UEFI: Virtual CDROM0 1.00**.

c). Follow the instructions at [Installing Red Hat Enterprise Linux](#).

### 2.4. Installing Red Hat Enterprise Linux

This section assumes you have booted the Red Hat Enterprise Linux ISO image. For DGX Station, this can only be performed **locally**; for all other platforms, this can be performed **locally** or **remotely**.

If you wish to automate the installation with a kickstart file, see the section [Installing with Kickstart](#).
1. After booting the ISO image, the GRUB menu for the installer appears.

2. Select **Install Red Hat Enterprise Linux** and press `e` to edit the selected option.
   a). Add the “nomodeset” parameter as shown below.
   
   “nomodeset” prevents the in-box Nouveau driver from loading as it may not properly support the GPUs used in the DGX systems, resulting in display issues.

   b). Press **Ctrl-x** to save your changes and start the installation.

4. Configure the language, region, date, time, keyboard, and other configuration options you may need from the Installation Summary screen.

5. Set the Software Selection to the correct value.

   For DGX Station this should remain at the default of Server with GUI. For other DGX platforms it should be changed to Minimal Install.

6. Partition your disks based on the platform and whether or not you would like to use encryption:
   - Disk Partitioning for DGX-1 and DGX Station
   - Disk Partitioning with Encryption for DGX-1 and DGX Station
   - Disk Partitioning for DGX-2 and DGX A100
   - Disk Partitioning with Encryption for DGX-1 and DGX Station

7. Configure Ethernet.

   From the Network & Host Name section, select and enable the Ethernet device. This defaults to DHCP and can be changed for static IP configurations under Configure.
8. From the **INSTALLATION SUMMARY** screen, click **Begin installation** to start the installation.
While the installation process is running, set your password (ROOT PASSWORD) and create a new user (USER CREATION) from the Configuration screen.

9. Complete the initial Red Hat Enterprise Linux setup.

   ▶ If you installed using the Server with GUI base environment, the Initial Setup starts automatically where you can accept the license agreement and register the system. See the Red Hat instructions for details.
   ▶ If you are using CentOS you will need to accept the license agreement.
   ▶ If you installed with any other base environment, log on to the system as root user and then register the system.

     subscription-manager register --auto-attach --username=user_name --password=password

See How to register and subscribe a system to the Red Hat Customer Portal using Red Hat Subscription-Manager for further information.

2.4.1. Installing with Kickstart

Kickstart provides a method of automating the installation process by providing a file which contains the answers to the questions that would be asked during installation. NVIDIA provides kickstart templates for all supported platforms in the following locations:

   ▶ https://repo.download.nvidia.com/baseos/el/el-files/8/el8-ks/dgxstation-ks.cfg
In these files are tags that you must replace with your site specific information: language, keyboard, time zone, hostname, etc. Each tag is of the form `<CHANGE_YOUR_xxxx>`. These tags must be replaced with your specific information.

Once you have a kickstart file customized for your installation, place that file in a location that can be accessed by NFS, FTP, HTTP, or HTTPS. After booting from the installation medium, when the grub menu appears, press `e` to edit the grub entry as you normally would to add the “nomodeset” option. In addition to “nomodeset”, add an option in the format “inst.ks=<URL>”. For example:

```ini
inst.ks=https://192.168.1.2/kickstart/dgx-a100-cfg.ks
```

Finally, after using these kickstart files, remember to reboot the system one final time to apply all settings.

For more information on using kickstart files with Red Hat 8, refer to the Starting Kickstart Installations chapter in Red Hat’s documentation.

### 2.4.2. Disk Partitioning for DGX-1 and DGX Station

Note: The screenshots in the following section are taken from a DGX-1. The screens for the DGX Station installation can present slightly different information for such things as disk size, disk space available, interface names, etc.

1. At the **Installation Destination** screen, select the first drive (sda) to install on.
Under **Storage Configuration**, click the **Custom** radio button and then click **Done**. This brings up the **Manual Partitioning** window.
2. Expand the drop-down menu for the device you’ve selected and delete all existing partitions until there are none remaining.
3. Click the + button on the bottom left to create a new partition.
   Create the `/boot/efi` partition with a size of 512 MiB.
4. Select **Standard Partition** for the Device Type.
Under **Devices**, ensure only the drive you chose in step 1 is selected. Click Update Settings to confirm your changes.

5. Click the + button on the bottom left again to create another new partition.

Create the / partition, this time leaving the **Desired Capacity** field empty. This lets the installer know to use the remaining capacity of the disks.
6. For the / partition, again select **Standard Partition** for the Device Type.
Under **Devices**, ensure that only the drive you chose in step 1 is selected. For the File System, select **XFS**. Click **Update Settings** to confirm your changes.

7. Click **Done**.

This causes a yellow warning bar to appear on the bottom because no swap partition has been created.
8. Click **Done** again and then click **Accept Changes** to write all of our customizations to disk.

2.4.3. Disk Partitioning with Encryption for DGX-1 and DGX Station

Note: The screenshots in the following section are taken from a DGX-1. The screens for the DGX Station installation can present slightly different information for such things as disk size, disk space available, interface names, etc.

1. At the Installation Destination screen, select the first drive (/dev/sda) to install on. Under Storage Configuration, click the Custom radio button and then click Done.
This brings up the **Manual Partitioning** window.

2. Expand the drop-down menu for the device you’ve selected and delete all existing partitions until there are none remaining.
3. Click the + button on the bottom left to create a new partition. Create the `/boot/efi` partition with a size of 512 MiB.
4. Select **Standard Partition** for the Device Type.
Under **Devices**, ensure only the drive you chose in step 1 is selected.

Click **Update Settings** to confirm your changes.

5. Click the + button on the bottom left again to create another new partition.

Create the `/boot` partition with a size of 2 GiB.
6. For the /boot partition, again select **Standard Partition** for the Device Type.
Under **Devices**, ensure that only the drive you chose in step 1 is selected. For the File System, select **XFS**.

Click **Update Settings** to confirm your changes.

7. Click the + button on the bottom left again to create another new partition.

Create the / partition, this time leaving the **Desired Capacity** field empty. This lets the installer know to use the remaining capacity of the disks.
8. For the / partition, again select **Standard Partition** for the Device Type.
Be sure to check the **Encrypt** checkbox, and choose **luks2** for the **LUKS Version**.

For the **File System**, select **XFS**. Again confirm that this partition uses both of the devices you selected in step 2.

Click **Update Settings** to confirm your changes.

A prompt will now appear, asking for a LUKS password.

9. Be sure to choose a strong and secure password.
After entering your password twice, click **Save Passphrase**.

10. Click **Done**.

This causes a yellow warning bar to appear on the bottom because no swap partition has been created.
11. Click Done again and then click Accept Changes to write all of our customizations to disk.
12. Return to step 5 in the Installing Red Hat Enterprise Linux section.

2.4.4. Disk Partitioning for DGX-2 and DGX A100

Note: The screenshots in the following section are taken from a DGX A100. The screens for the DGX-2 installation can present slightly different information for such things as disk size, disk space available, interface names, etc.

1. At the Installation Destination screen, select both M.2 disks (that is, the 894,25GB drives for DGX-2, or the 1.8 TB drives for DGX A100).
Under **Storage Configuration**, click the **Custom** radio button and then click **Done**.

This brings up the **Manual Partitioning** window.
2. Expand the drop-down menu for the device you’ve selected and delete all existing partitions until there are none remaining.
3. Click the + button on the bottom left to create a new partition.

Create the `/boot/efi` partition with a size of 512 MiB.
4. Change the **Device Type** to RAID, change the **RAID Level** to RAID1, and confirm that this partition covers both of the devices you selected in step 2.
Click **Update Settings** to confirm your changes.

5. Click the + button on the bottom left again to create another new partition.

Create the / partition, this time leaving the **Desired Capacity** field empty. This lets the installer know to use the remaining capacity of the disks.
6. For the / partition, again select RAID for the Device Type, RAID1, and the RAID Level. For the File System, select XFS.
Again confirm that this partition uses both of the devices you selected in step 2.

Click **Update Settings** to confirm your changes.

7. Click **Done**.

This causes a yellow warning bar to appear on the bottom because no swap partition has been created.
8. Click **Done** again and then click **Accept Changes** to write all of our customizations to disk.
9. Return to step 5 in the **Installing Red Hat Enterprise Linux** section.

2.4.5. **Disk Partitioning with Encryption for DGX-2 and DGX A100**

*Note:* The screenshots in the following section are taken from a DGX A100. The screens for the DGX-2 installation can present slightly different information for such things as disk size, disk space available, interface names, etc.

1. At the **Installation Destination** screen, select both M.2 disks (that is, the 894.25GB drives for DGX-2, or the 1.8 TB drives for DGX A100).
Under **Storage Configuration**, click the **Custom** radio button and then click **Done**.

This brings up the **Manual Partitioning** window.

2. Expand the drop-down menu for the device you’ve selected and delete all existing partitions until there are none remaining.
3. Click the + button on the bottom left to create a new partition.

Create the `/boot/efi` partition with a size of 512 MiB.
4. Change the **Device Type** to **RAID**, change the **RAID Level** to **RAID1**, and confirm that this partition covers both of the devices you selected in step 2 by clicking **Modify** in the **Device(s)** section and making sure both disks are still selected.
Note that the partition information on the left may not reflect both devices yet.

Click **Update Settings** to confirm your changes, and verify that the `/boot/efi` partition shown lists the partition name and not the individual device.

5. Click the + button on the bottom left again to create another new partition. Create the `/boot` partition with a size of **2 GiB**.
6. For the /boot partition, again select **RAID** for the **Device Type**, **RAID1**, and the **RAID Level**. For the **File System**, select **XFS**.
Again confirm that this partition uses both of the devices you selected in step 2 by clicking Modify in the Device(s) section and making sure both disks are still selected.

Click Update Settings to confirm your changes.

7. Click the + button on the bottom left again to create another new partition.

Create the / partition, this time leaving the Desired Capacity field empty. This lets the installer know to use the remaining capacity of the disks.
8. For the / partition, again select RAID for the Device Type, RAID1 and the RAID Level. Be sure to check the Encrypt checkbox, and choose luks2 for the LUKS Version.
For the **File System**, select **XFS**. Again confirm that this partition uses both of the devices you selected in step 2.

Click **Update Settings** to confirm your changes, and **Done** to begin exiting the partition menu.

A prompt will now appear asking for a LUKS password.

9. Be sure to choose a strong and secure password.
After entering your password twice, click **Save Passphrase**.

10. Click **Done**.

This causes a yellow warning bar to appear on the bottom because no swap partition has been created.
11. Click **Done** again and then click **Accept Changes** to write all of our customizations to disk.
12. Return to step 5 in the Installing Red Hat Enterprise Linux section.
Chapter 3. Installing the DGX Software

This section requires that you have already installed Red Hat Enterprise Linux 8 or derived operating system on the DGX system. You can skip this section if you already installed the DGX software stack during a kickstart install.

3.1. Configuring a System Proxy

If your network requires use of a proxy, then

- Edit the file `/etc/dnf/dnf.conf` and make sure the following lines are present in the `[main]` section, using the parameters that apply to your network:
  
  ```
  proxy=http://<Proxy-Server-IP-Address>:<Proxy-Port>
  proxy_username=<Proxy-User-Name>
  proxy_password=<Proxy-Password>
  ```

3.2. Enabling the DGX Software Repository

**ATTENTION:** By running these commands you are confirming that you have read and agree to be bound by the DGX Software License Agreement. You are also confirming that you understand that any pre-release software and materials available that you elect to install in a DGX may not be fully functional, may contain errors or design flaws, and may have reduced or different security, privacy, availability, and reliability standards relative to commercial versions of NVIDIA software and materials, and that you use pre-release versions at your risk.

Install the NVIDIA DGX Package for Red Hat Enterprise Linux.

```
sudo dnf install -y 
https://repo.download.nvidia.com/baseos/el/el-files/8/nvidia-repo-
setup-21.05-1.el8.x86_64.rpm
```
3.3. Installing Required Components

1. On Red Hat Enterprise Linux, run the following commands to enable additional repositories required by the DGX Software.

   ```
sudo subscription-manager repos --enable=rhel-8-for-x86_64-appstream-rpms
sudo subscription-manager repos --enable=rhel-8-for-x86_64-baseos-rpms
sudo subscription-manager repos --enable=codeready-builder-for-rhel-8-x86_64-rpms
   ```

2. Upgrade to the latest software.

   ```
Important: Before performing the upgrade, consult the release notes for additional instructions depending on the specific EL8 release.
   ```

   ```
sudo dnf update -y --nobest
   ```

3. Install DGX tools and configuration files.

   - For DGX-1, install **DGX-1 Configurations**.
     ```
sudo dnf group install -y 'DGX-1 Configurations'
   ```

   - For the DGX-2, install **DGX-2 Configurations**.
     ```
sudo dnf group install -y 'DGX-2 Configurations'
   ```

   - For the DGX A100, install **DGX A100 Configurations**.
     ```
sudo dnf group install -y 'DGX A100 Configurations'
   ```

   - For the DGX Station, install **DGX Station Configurations**.
     ```
sudo dnf group install -y 'DGX Station Configurations'
   ```

   The configuration changes take effect only after rebooting the system, which will be performed after installing the CUDA driver.

4. Configure the `/raid` partition.

   All DGX systems support RAID 0 or RAID 5 arrays.

   The following commands create a RAID array, mount it to `/raid` and create an appropriate entry in `/etc/fstab`.

   - To create a RAID 0 array:
     ```
sudo /usr/bin/configure_raid_array.py -c -f
   ```

   - To create a RAID 5 array:
     ```
sudo /usr/bin/configure_raid_array.py -c -f -5
   ```

   **Note:** The RAID array must be configured before installing `nvidia-conf-cachefilesd`, which places the proper SELinux label on the `/raid` directory. If you ever need to recreate the RAID array — which will wipe out any labeling on `/raid` — after `nvidia-conf-cachefilesd` has already been installed, be sure to restore the label manually before restarting `cachefilesd`.

   ```
sudo restorecon /raid
sudo systemctl restart cachefilesd
   ```

   **Optional:** If you wish to use your RAID array for caching, install `nvidia-conf-cachefilesd`. This will update the `cachefilesd` configuration to use the `/raid` partition.
5. Install the NVIDIA CUDA driver.

```
sudo dnf install -y nvidia-conf-cachefilesd
```

**Important:** If you are installing the CUDA driver from a local repository, follow the instructions at Installing the NVIDIA CUDA Driver from the Local Repository instead.

a. For non-NVSwitch systems such as DGX-1 and DGX Station, install the driver using the default profile:

```
sudo dnf module install -y nvidia-driver:450
sudo dnf install -y nv-persistence-mode libnvidia-nscq-450
```

b. For NVSwitch systems such as DGX-2 and DGX A100, install the driver using the fabric manager (fm) profile:

```
sudo dnf module install -y nvidia-driver:450/fm
sudo dnf install -y nv-persistence-mode nvidia-fm-enable
```

6. Reboot the system to load the drivers and to update system configurations.

a. Issue the reboot.

```
sudo reboot
```

b. After the system has rebooted, verify that the drivers have been loaded and are handling the NVIDIA devices.

```
nvidia-smi
```

The output should show all available GPUs.

**Example:**

```
+-----------------------------------------------------------------------------+
<table>
<thead>
<tr>
<th>NVIDIA-SMI 450.80.02  Driver Version: 450.80.02  CUDA Version: 11.0</th>
</tr>
</thead>
</table>
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC
| Fan  Temp  Perf  Pwr:Usage/Cap| Memory-Usage | GPU-Util  Compute M.
|                               |                |               MIG M. |
|-------------------------------+----------------------+----------------------|
|   0  Tesla V100-SXM2...  On   | 00000000:00:00.0 Off |                    0 |
| N/A   35C    P0    42W / 300W |      0MiB / 16160MiB |      0%      Default |
|                               |                      |                  N/A |
|-------------------------------+----------------------+----------------------|
|   1  Tesla V100-SXM2...  On   | 00000000:07:00.0 Off |                    0 |
| N/A   35C    P0    44W / 300W |      0MiB / 16160MiB |      0%      Default |
|                               |                      |                  N/A |
|-------------------------------+----------------------+----------------------|
| ...                           +----------------------+----------------------|
|   7  Tesla V100-SXM2...  On   | 00000000:00:00.0 Off |                    0 |
```

7. Install the NVIDIA container device plugin.
   a. Install docker-ce.
      As this may conflict with existing packages on the system, specify the --allowerasing option:
      
      ```
      sudo dnf install -y docker-ce --allowerasing
      ```
   b. Install the NVIDIA Container Runtime group
      
      ```
      sudo dnf group install -y 'NVIDIA Container Runtime'
      ```
   c. Restart the docker daemon.
      
      ```
      sudo systemctl restart docker
      ```
   d. Run the following command to verify the installation.
      
      ```
      sudo docker run --gpus=all --rm nvcr.io/nvidia/cuda:11.0-base nvidia-smi
      ```
      
      See the section Running Containers for more information about this command.

The output should show all available GPUs

``````
3.4. Installing Optional Components

The DGX is fully functional after installing the components as described in Installing Required Components. If you intend to launch NGC containers (which incorporate the CUDA toolkit, NCCL, cuDNN, and TensorRT) on the DGX system, which is the expected use case, then you can skip this section.

If you intend to use your DGX system as a development system for running deep learning applications on bare metal, then install the optional components as described in this section.

1. Install the CUDA Toolkit 11.2.
   
   ```bash
   sudo dnf install -y cuda-toolkit-11-2 cuda-compat-11-2 nvidia-cuda-compat-setup
   ```

2. To administer self-encrypting drives, install the nv-disk-encrypt package.
   
   ```bash
   sudo dnf install -y nv-disk-encrypt
   sudo reboot
   ```

   Refer to the ”Managing Self-Encrypting Drives” section in the DGX A100 User Guide for usage information.

3. To install the NVIDIA Collectives Communication Library (NCCL) Runtime, refer to the NCCL: Getting Started documentation.

4. To install the CUDA Deep Neural Networks [cuDNN] Library Runtime, refer to the NVIDIA cuDNN page.

5. To install NVIDIA TensorRT, refer to the NVIDIA TensorRT page.
3.5. Installing the Optional NVIDIA Desktop Theme

The DGX Software Repository also provides optional theme packages and desktop wallpapers to give the user-interface an NVIDIA look-and-feel for the DGX Station desktop. These packages would have been installed as part of the DGX Station Configurations group.

1. To apply the theme and background images, first open gnome-tweaks.
2. Under Applications, select one of the NV-Yaru themes. This comes in default, light, and dark variations.
3. Under Shell, select the NV-Yaru-dark theme. If this field is grayed out, you may need to reboot the system or restart GDM in order to enable the user-themes extension.

To restart GDM, issue the following.
```bash
sudo systemctl restart gdm
```
4. Select one of the NVIDIA wallpapers for the background image and lock screen.
The following is an example of running the CUDA container from the NGC registry.

```
sudo docker run --gpus=all --rm nvcr.io/nvidia/cuda:11.0-base nvidia-smi
```
Chapter 5. Configuring Storage - NFS Mount and Cache

By default, the DGX System includes multiple SSDs in a RAID configuration (4 SSDs in the DGX-1, 8 or 16 SSDs in the DGX-2, and 3 SSDs in the DGX Station). These SSDs are intended for application caching, so NVIDIA recommends that you set up your own NFS storage for long term data storage. The following instructions describe how to mount the NFS onto the DGX System, and how to cache the NFS using the DGX SSDs for improved performance.

Make sure that you have an NFS server with one or more exports with data to be accessed by the DGX System, and that there is network access between the DGX System and the NFS server.

1. Install the nfs packages.
   
   ```$ sudo yum install nfs-utils```

2. Configure an NFS mount for the DGX.
   
   a). Edit the filesystem tables configuration.
   
   ```sudo vi /etc/fstab```

   b). Add a new line for the NFS mount, using the local mount point of `/mnt`.

   ```<nfs_server>:<export_path> /mnt nfs
      rw,noatime,rsize=32768,wsize=32768,nolock,tcp,intr,fsc,nofail 0 0```

   `/mnt` is used here as an example mount point.

   Consult your Network Administrator for the correct values for `<nfs_server>` and `<export_path>`.

   The nfs arguments presented here are a list of recommended values based on typical use cases. However, "fsc" must always be included as that argument specifies use of FS-Cache.

   c). Save the changes.

3. Verify the NFS server is reachable.
   
   ```ping <nfs_server>```

   Use the server IP address or the server name provided by your network administrator.

4. Mount the NFS export.
   
   ```sudo mount /mnt```

   `/mnt` is the example mount point used in step 1.

5. Verify caching is enabled.
cat /proc/fs/nfsfs/volumes

Look for the text **FSC=yes** in the output. The NFS will be mounted and cached on the DGX System automatically upon subsequent reboot cycles.
Appendix A. Installing Software on Air-Gapped NVIDIA DGX Systems

When installing Red Hat Enterprise Linux on DGX systems, many of the packages that the DGX system requires are downloaded over the internet from both Red Hat and NVIDIA servers. This is not suitable for tightly secured systems which must be “Air-Gapped”; isolated from the internet or outside networks.

Since most DGX software updates are accomplished through an over-the-network process with NVIDIA servers, this section explains how updates can be made when using an over-the-network method is not an option. It includes a process for installing containers as well.

A.1. Registering Your System

See the Red Hat customer portal knowledge base article How to register and subscribe a system offline to the Red Hat Customer Portal.

A.2. Creating a Local Mirror of the NVIDIA Repository

This section presents both a general procedure for copying repositories, and also an example of copying the NVIDIA provided software repository for DGX-specific software.

The Red Hat customer portal provides a knowledge base article for creating a local mirror. Pay particular attention to the instructions under Create a local repo with Red Hat Enterprise Linux 8. The reposync command can now download repository metadata as well, so there is no longer a need to use createrepo after.

The repositories that will need to be mirrored are:

- rel-8-for-x86_64-appstream-rpms
- rel-8-for-x86_64-baseos-rpms
Installing Software on Air-Gapped NVIDIA DGX Systems

- codeready-builder-for-rhel-8-x86_64-rpms
- nvidia-dgx-8
- CUDA

Once mirrored, be sure to configure the target system to use your local repository. This can be accomplished by creating file under `/etc/yum.repos.d/my_mirror.repo` with the following contents:

```
[nvidia-dgx-8]
name=NVIDIA DGX EL8
baseurl=file://path/to/your/nvidia-dgx-8-repo-mirror/
enabled=1
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-dgx-cosmos-support

[CUDA]
name=NVIDIA CUDA for EL8
baseurl=file://path/to/your/CUDA-repo-mirror/
enabled=1
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-cuda
```

Note: The instructions assume that you have the repositories enabled on the local machine. See Enabling the DGX Software Repository for instructions on enabling the NVIDIA DGX EL8 repository.

A.3. Installing Docker Containers

This method applies to Docker containers hosted on the NGC Container Registry. Most container images are freely available, but some are locked and require that you have an NGC account to access. See the NGC Private Registry User Guide for instructions on accessing locked container images.

1. Enter the docker pull command, specifying the image registry, image repository, and tag.
   ```
   docker pull nvcr.io/nvidia/repository:tag
   ```
2. Verify the image is on your system using docker images.
   ```
   docker images
   ```
3. Save the Docker image as an archive.
   ```
   docker save nvcr.io/nvidia/repository:tag > framework.tar
   ```
4. Transfer the image to the air-gapped system using removable media such as a USB flash drive.
5. Load the NVIDIA Docker image.
   ```
   docker load -i framework.tar
   ```
6. Verify the image is on your system.
   ```
   docker images
   ```
Appendix B. Installing Software Using Local Repositories

As an alternative to the reposync method described in Appendix A, software can also be installed using local repos. These repos provided by NVIDIA will install all of the available packages locally in the filesystem, allowing installation of packages without network access.

B.1. Installing the Base Red Hat Enterprise Linux System

The Red Hat components of the software must be installed either using the standard network based installation, or as described in Appendix A. This includes registering and subscribing to the Red Hat Customer Portal.

If the system is connected to the network, follow the steps of the standard Red Hat installation, then enable the additional Red Hat repositories. Finally, execute:

```
sudo dnf update -y
sudo dnf install -y kernel-devel kernel-headers
sudo reboot
```

If the system is not connected to the network, follow the instructions in Appendix A to mirror the Red Hat repositories using reposync.

B.2. Downloading the Local Repositories

Download the DGX Software local repository from http://repo.download.nvidia.com/baseos/el/el-files/8/dgx-local-repo-20.11-89.el8.x86_64.rpm

Download the NVIDIA CUDA driver local repository from https://us.download.nvidia.com/tesla/450.102.04/nvidia-driver-local-repo-rhel8-450.80.02-1.0-1.x86_64.rpm

Download the CUDA 11.2 Toolkit local repository from https://developer.download.nvidia.com/compute/cuda/11.2.0/local_instalers/cuda-repo-rhel8-11-2-local-11.2.0_460.27.04-1.x86_64.rpm
B.3. Installing the Local Repositories

Install the local repositories

```bash
sudo dnf install -y ./dgx-local-repo-20.11-89.el8.x86_64.rpm
sudo dnf install -y ./nvidia-driver-local-repo-rhel8-450.80.02-1.0-1.x86_64.rpm
sudo dnf install -y ./cuda-repo-rhel8-11-2-local-11.2.0_460.27.04-1.x86_64.rpm
```

With the local repositories installed, proceed with the standard Installing the DGX Software instructions, with the exception of the CUDA driver installation. To install the CUDA driver from the local repository, follow the steps in the next section Installing the NVIDIA CUDA Driver from the Local Repository.

B.4. Installing the NVIDIA CUDA Driver from the Local Repository

- For non-NVSwitch systems such as DGX-1 and DGX Station, install the driver using the default profile:
  ```bash
  sudo dnf module install -y nvidia-driver:450-dkms
  sudo dnf install -y nv-persistence-mode libnvidia-nscq-450
  ```

- For NVSwitch systems such as DGX-2 and DGX A100, install the driver using the fabricmanager (fm) profile:
  ```bash
  sudo dnf module install -y nvidia-driver:450-dkms/fm
  sudo dnf install -y nv-persistence-mode nvidia-fm-enable
  ```
Appendix C. Changing the BMC Login

The NVIDIA DGX server includes a base management controller (BMC) for out-of-band management of the DGX system. NVIDIA recommends disabling the default username and creating a unique username and password as soon as possible.

C.1. Changing the BMC Login on the DGX-1

1. Log into the BMC.
   a). Open a browser within your LAN and go to http://<BMC-ip-address>/.
       Use Firefox or Internet Explorer. Google Chrome is not officially supported by the DGX-1 BMC.
   b). Log in, using qct.admin/qct.admin for the User ID/Password.

2. Select Configuration → Users.
3. Add a new user.
   a. Select an empty field and click Add User.

   ![NVIDIA Interface]

   **User Management**

   The list below shows the current list of available users. To delete or modify a user, select the user name from the list and click “Delete User” or “Modify User”. To add a new user, select an unconfigured slot and click “Add User”.

   Number of configured users: 2

<table>
<thead>
<tr>
<th>UserID</th>
<th>Username</th>
<th>User Access</th>
<th>Network Privilege</th>
<th>SNMPv3 Status</th>
<th>Email ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>anonymous</td>
<td>Disabled</td>
<td>Administrator</td>
<td>Disabled</td>
<td>~</td>
</tr>
<tr>
<td>2</td>
<td>qct_admin</td>
<td>Enabled</td>
<td>Administrator</td>
<td>Disabled</td>
<td>~</td>
</tr>
<tr>
<td>3</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>4</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>5</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>6</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>7</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>8</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>9</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
<tr>
<td>10</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
<td>~</td>
</tr>
</tbody>
</table>

   b. Enter new user information and click Add.
4. Log out and then log back in as the new user.
5. Select Configuration → Users.
   a) Select the user qct.admin user and select Modify User
b). Deselect Enable in User Access and click Modify.

c). Ensure User Access is disabled for the user qct.admin.
Changing the BMC Login

C.2. Changing the BMC Login on the DGX-2 or DGX A100

1. Log into the BMC.
   a. Open a browser within your LAN and go to https://<BMC-ip-address>/.
   b. Log in, using admin/admin for the User ID/Password.
2. Select **Settings** from the left-side navigation menu.
3. Select the **User Management** card.

7. Log out.
4. Click the green Help icon (?) for information about configuring users, then add a new user with unique username and strong password.
5. Log out and then log back in as the new user.
7. Disable the admin and anonymous users.
Appendix D. Installing the Mellanox InfiniBand Drivers

Unlike the DGX OS shipped with the NVIDIA DGX server, the DGX software stack for Red Hat-derived operating systems does not include the Mellanox OpenFabrics Enterprise Distribution (MLNX_OFED) for Linux. This is to avoid an installation where the MLNX_OFED kernel may be out of sync with the Red Hat distribution kernel.

When using MLNX_OFED with Red Hat, ensure you install a supported MLNX_OFED kernel version to avoid incompatibilities with the Red Hat distribution kernel on the system.

To use InfiniBand on the DGX server, do the following.

1. Determine which MLNX_OFED package supports the latest version of the installed Red Hat Enterprise Linux release.
      
      Note that the "dnf update" command that is run before installing the NVIDIA driver will update you to the latest Red Hat Enterprise Linux 8 version.
   b). Visit https://docs.mellanox.com/category/mlnxofedib, click the latest MLNX_OFED software version and then use the side menu to navigate to Release Notes->General Support in MLNX_OFED and view Supported Operating Systems to determine the MLNX_OFED package OS support.

      It is imperative that the correct MOFED version is used for the Red Hat Enterprise Linux 8 version that the DGX server is running. NVIDIA has tested Red Hat Enterprise Linux 8 with MOFED version 5.1-2.5.8.0.

2. Visit the Mellanox site and download and install the appropriate MLNX_OFED driver.

3. Install nvidia-mlnx-config.
   ```bash
   sudo dnf install nvidia-mlnx-config
   ```

4. Install kernel headers and development packages for your kernel.
   These are needed for the ensuing DKMS compilation:
   ```bash
   sudo dnf install -y kernel-headers-$uname -r kernel-devel-$uname -r
   ```

5. After installing the MLNX_OFED drivers, install the NVIDIA peer memory module.
   ```bash
   sudo dnf install -y nvidia-peer-memory-dkms
   ```
Appendix E. Installing the Mellanox ConnectX-6 Firmware

MOFED version 5.1-2.5.8.0 contains adapter card firmware version xx.28.2006, while the latest GA version of the ConnectX-6 firmware is 20.28.4000.

NVIDIA has tested Red Hat Enterprise Linux 8 with the latest ConnectX-6 firmware, 20.28.4000. This can be downloaded directly from the Mellanox site. The ConnectX-6 adapter card versions used in DGX A100 are:

- OPN MCX653105A-HDA_Ax, PSID MT_0000000223
- OPN MCX653106A-HDA_Ax, PSID MT_0000000225

Download the latest version from the Mellanox site, and follow the instructions to burn the new firmware.
Notice

This document is provided for information purposes only and shall not be regarded as a warranty of a certain functionality, condition, or quality of a product. NVIDIA Corporation ("NVIDIA") makes no representations or warranties, expressed or implied, as to the accuracy or completeness of the information contained in this document and assumes no responsibility for any errors contained herein. NVIDIA shall have no liability for the consequences or use of such information or for any infringement of patents or other rights of third parties that may result from its use. This document is not a commitment to develop, release, or deliver any Material (defined below), code, or functionality.

NVIDIA reserves the right to make corrections, modifications, enhancements, improvements, and any other changes to this document, at any time without notice. Customer should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

NVIDIA products are sold subject to the NVIDIA standard terms and conditions of sale supplied at the time of order acknowledgement, unless otherwise agreed in an individual sales agreement signed by authorized representatives of NVIDIA and customer ("Terms of Sale"). NVIDIA hereby expressly objects to applying any customer general terms and conditions with regards to the purchase of the NVIDIA product referenced in this document. No contractual obligations are formed either directly or indirectly by this document.

NVIDIA products are not designed, authorized, or warranted to be suitable for use in medical, military, aircraft, space, or life support equipment, nor in applications where failure or malfunction of the NVIDIA product can reasonably be expected to result in personal injury, death, or property or environmental damage. NVIDIA accepts no liability for inclusion and/or use of NVIDIA products in such equipment or applications and therefore such inclusion and/or use is at customer’s own risk.

NVIDIA makes no representation or warranty that products based on this document will be suitable for any specified use. Testing of all parameters of each product is not necessarily performed by NVIDIA. It is customer’s sole responsibility to evaluate and determine the applicability of any information contained in this document, ensure the product is suitable for the application planned by customer, and perform the necessary testing for the application in order to avoid a default of the application or the product. Weaknesses in customer’s product designs may affect the quality and reliability of the NVIDIA product and may result in additional or different conditions and/or requirements beyond those contained in this document. NVIDIA accepts no liability related to any default, damage, costs, or problem which may be based on or attributable to: (i) the use of the NVIDIA product in any manner that is contrary to this document or (ii) customer product designs.

No license, either expressed or implied, is granted under any NVIDIA patent right, copyright, or other NVIDIA intellectual property right under this document. Information published by NVIDIA regarding third-party products or services does not constitute a license from NVIDIA to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property rights of the third party, or a license from NVIDIA under the patents or other intellectual property rights of NVIDIA.

Reproduction of information in this document is permissible only if approved in advance by NVIDIA in writing, reproduced without alteration and in full compliance with all applicable export laws and regulations, and accompanied by all associated conditions, limitations, and notices.

THIS DOCUMENT AND ALL NVIDIA DESIGN SPECIFICATIONS, REFERENCE BOARDS, FILES, DRAWINGS, DIAGNOSTICS, LISTS, AND OTHER DOCUMENTS (TOGETHER AND SEPARATELY, “MATERIALS”) ARE BEING PROVIDED “AS IS.” NVIDIA MAKES NO WARRANTIES, EXPRESSED, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE MATERIALS, AND EXPRESSLY DISCLAIMS ALL IMPLIED WARRANTIES OF NONINFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE. TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL NVIDIA BE LIABLE FOR ANY DAMAGES, INCLUDING WITHOUT LIMITATION ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF ANY USE OF THIS DOCUMENT, EVEN IF NVIDIA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Notwithstanding any damages that customer might incur for any reason whatsoever, NVIDIA’s aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms of Sale for the product.
