

## **Controlling Host PF and VF Parameters**

# Table of contents

Configuring Uplink MTU	5
------------------------	---

---

NVIDIA® BlueField® networking platforms (DPUs or SuperNICs) allow control over some of the networking parameters of the PFs and VFs running on the host side.

## Setting Host PF and VF Default MAC Address

From the Arm, users may configure the MAC address of the physical function in the host. After sending the command, users must reload the NVIDIA driver in the host to see the newly configured MAC address. The MAC address goes back to the default value in the firmware after system reboot.

Example:

```
$ echo "c4:8a:07:a5:29:59" > /sys/class/net/p0/smart_nic/pf/mac
$ echo "c4:8a:07:a5:29:61" > /sys/class/net/p0/smart_nic/vf0/mac
```

## Setting Host PF and VF Link State

vPort state can be configured to Up, Down, or Follow. For example:

```
$ echo "Follow" > /sys/class/net/p0/smart_nic/pf/vport_state
```

## Querying Configuration

To query the current configuration, run:

```
$ cat /sys/class/net/p0/smart_nic/pf/config
MAC          : e4:8b:01:a5:79:5e
MaxTxRate    : 0
State        : Follow
```

Zero signifies that the rate limit is unlimited.

## Disabling Host Networking PFs

It is possible to not expose networking functions to the host for users interested in using storage or virtio functions only. When this feature is enabled, the host PF representors (i.e. `pf0hpf` and `pf1hpf`) will not be seen on the Arm.

- Without a PF on the host, it is not possible to enable SR-IOV, so VF representors will not be seen on the Arm either
- Without PFs on the host, there can be no SFs on it

To disable host networking PFs, run:

```
mlxconfig -d /dev/mst/mt41686_pciconf0 s NUM_OF_PF=0
```

To reactivate host networking PFs:

- For single-port BlueFields, run:

```
mlxconfig -d /dev/mst/mt41686_pciconf0 s NUM_OF_PF=1
```

- For dual-port BlueFields, run:

```
mlxconfig -d /dev/mst/mt41686_pciconf0 s NUM_OF_PF=2
```

### **Note**

When there are no networking functions exposed on the host, the reactivation command must be run from the Arm.

**Note**

Perform [BlueField system reboot](#) for the `mlxconfig` settings to take effect.

---

# Configuring Uplink MTU

To configure the port MTU while operating in [DPU mode](#), users must restrict the external host port ownership by issuing the following command on the BlueField:

```
mlxprivhost -d /dev/mst/<pciconf0 device> r --disable_port_owner
```

Server cold reboot is required for this restriction to take effect.

Once the host is restricted, the port MTU is configured by changing the MTU of the uplink representor (`p0` or `p1`).
