Chapter 1. Changes and New Features

HBN 1.4.0 offers the following new features and updates:

- ▶ Added support for NVIDIA® BlueField®-3 DPUs
- ▶ Added beta level support for stateful ACLs over L2 VXLAN for east-west traffic

For known limitations and bugs, please refer to [Known Issues](#).

For resolved issues, please refer to the [Bug Fixes](#).

Chapter 2. Supported Hardware

HBN 1.4.0 has been tested on the following DPUs:

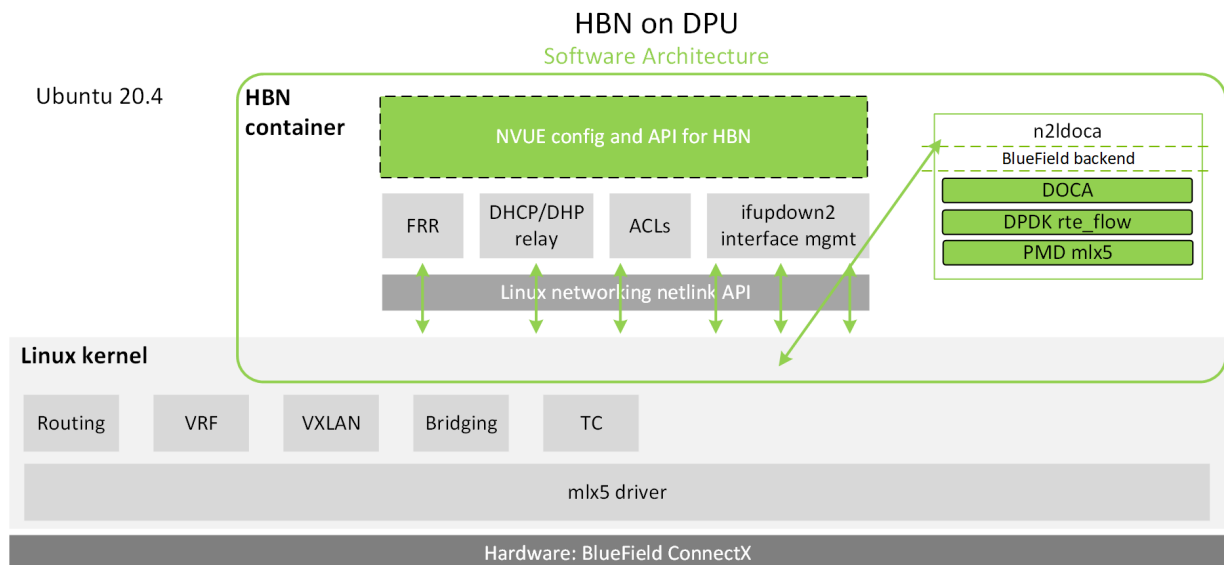

- ▶ BlueField-2 DPU Platforms:
 - ▶ BlueField-2 P-Series; 100GbE dual-port QSFP56; PCIe Gen 4.0 x16; 32GB on-board DDR; integrated BMC; FHHL
 - ▶ BlueField-2 P-Series; 25GbE dual-port SFP56; PCIe Gen 4.0 x8; 32GB on-board DDR; integrated BMC; FHHL
 - ▶ BlueField-2 P-Series; 25GbE dual-port SFP56; PCIe Gen 4.0 x8; 16GB on-board DDR; integrated BMC; FHHL
 - ▶ BlueField-2 P-Series; 25GbE dual-port SFP56; PCIe Gen 4.0 x8; 16GB on-board DDR; HHHH
- ▶ BlueField-3 DPU Platforms:
 - ▶ BlueField-3 BF3220 P-Series; 200GbE/NDR200 dual-port QSFP112; PCIe Gen 5.0 x16+x16 PCIe extension option; 32GB on-board DDR; integrated BMC; FHHL
 - ▶ BlueField-3 BF3210 P-Series; 100GbE/HDR100 dual-port QSFP112; PCIe Gen 5.0 x16+x16 PCIe extension option; 32GB on-board DDR; integrated BMC; FHHL

Chapter 3. HBN Overview

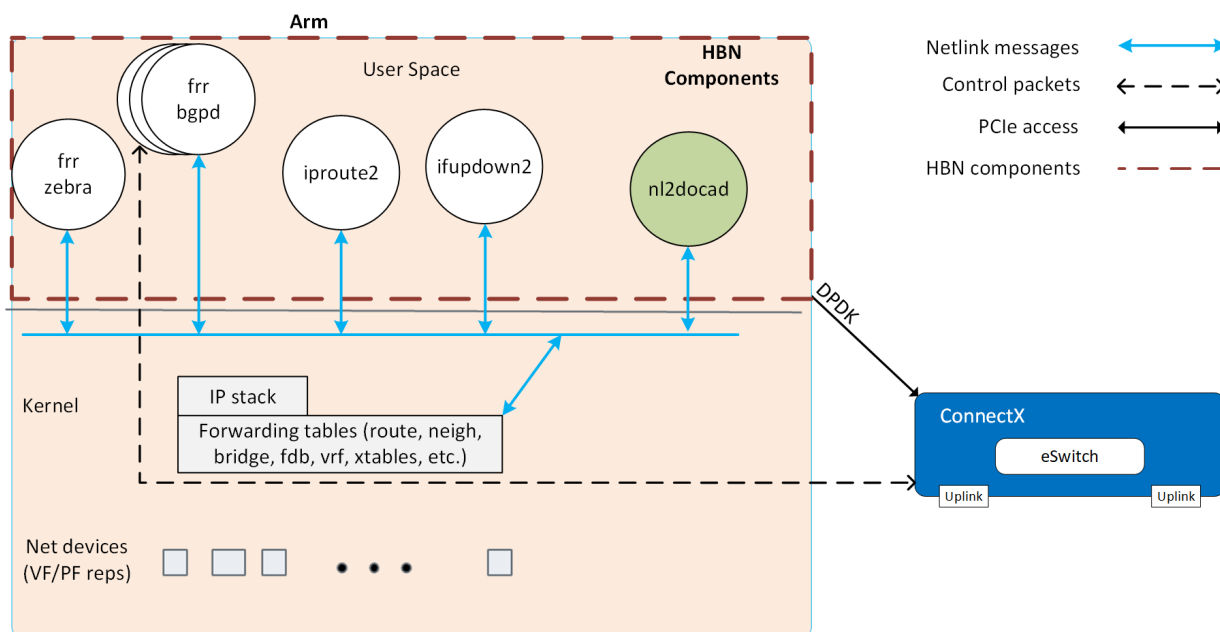

Host-based networking (HBN) is a DOCA service that enables the network architect to design a network purely on L3 protocols, enabling routing to run on the server-side of the network by using the DPU as a BGP router. The EVPN extension of BGP, supported by HBN, extends the L3 underlay network to multi-tenant environments with overlay L2 and L3 isolated networks.

The HBN solution packages a set of network functions inside a container which, itself, is packaged as a service pod to be run on the DPU. At the core of HBN is the Linux networking DPU acceleration driver. Netlink to DOCA daemon, or nl2docad, implements the DPU acceleration driver. nl2docad seamlessly accelerates Linux networking using DPU hardware programming APIs.

The driver mirrors the Linux kernel routing and bridging tables into the DPU hardware by discovering the configured Linux networking objects using the Linux Netlink API. Dynamic network flows, as learned by the Linux kernel networking stack, are also programmed by the driver into DPU hardware by listening to Linux kernel networking events.

The following diagram captures an overview of HBN and the interactions between various components of HBN.

- ▶ ifupdown2 is the interface manager which pushes all the interface related states to kernel
- ▶ The routing stack is implemented in FRR and pushes all the control states (EVPN MACs and routes) to kernel via netlink
- ▶ Kernel maintains the whole network state and relays the information using netlink. The kernel is also involved in the punt path and handling traffic that does not match any rules in the eSwitch.
- ▶ nl2docad listens for the network state via netlink and invokes the DOCA interface to accelerate the flows in the DPU HW tables. nl2docad also offloads these flows to eSwitch.

Chapter 4. Service Deployment

4.1. Preparing DPU for HBN Deployment

HBN requires service function chaining (SFC) to be activated on the DPU before running the HBN service container. SFC allows for additional services/containers to be chained to HBN and provides additional data manipulation capabilities.

The following subsections provide additional information about SFC and instructions on enabling it during DPU BFB installation.

4.1.1. Service Function Chaining

The diagram below shows the fully detailed default configuration for HBN with service function chaining (SFC).

In this setup, the HBN container is configured to use sub-function ports (SFs) instead of the actual uplinks, PFs and VFs. To illustrate, for example:

- ▶ Uplinks – use `p0_sf` instead of `p0`
- ▶ PF – use `pf0hpf_sf` instead of `pf0hpf`
- ▶ VF – use `pf0vfvf0_sf` instead of `pf0vfvf0`

The indirection layer between the SF and the actual ports is managed via a `br-sfc` OVS bridge automatically configured when the BFB image is installed on the DPU with HBN enabled. This indirection layer allows other services to be chained to existing SFs and provide additional functionality to transit traffic.

4.1.2. Enabling SFC for HBN Deployment

4.1.2.1. Deployment from BFB

To enable HBN SFC during BFB deployment, add the following parameters to the `bf.cfg` configuration file:

```
ENABLE_SFC_HBN=yes
NUM_SF_s_ECPF0=16 # Default value for the number of VFs on PF0
NUM_SF_s_ECPF1=4 # Default value for the number of VFs on PF1
```

Then run:

```
# bfb-install -c bf.cfg -r rshim0 -b <BFB-image>
```

4.1.2.2. Deployment from PXE

To enable HBN SFC using a PXE installation environment with BFB content, use the following configuration for PXE:

```
bfnet=<IFNAME>:<IPADDR>:<NETMASK> or <IFNAME>:dhcp
bfks=<URL of the kickstart script>
```

The kickstart script (bash) should include the following lines:

```
cat >> /etc/bf.cfg << EOF
ENABLE_SFC_HBN=yes
NUM_SF_s_ECPF0=<num-of-SFs-to-prepare-for-VFs-opened-by-x86-on-PF0>
NUM_SF_s_ECPF1=<num-of-SFs-to-prepare-for-VFs-opened-by-x86-on-PF1>
EOF
```

`/etc/bf.cfg` will be sourced by the BFB `install.sh` script.

Note: It is recommended to verify the accuracy of the DPU's clock post-installation. This can be done using the following command:

```
$ date
```

Please refer to the known issues listed in the [NVIDIA DOCA Release Notes](#) for more information.

4.2. HBN Service Container Deployment

HBN service is available on NGC, NVIDIA's container catalog. Service-specific configuration steps and deployment instructions can be found under the service's [container page](#). Make sure to follow the instructions in the NGC page to verify that the container is running properly.

For information about the deployment of DOCA containers on top of the BlueField DPU, refer to [NVIDIA DOCA Container Deployment Guide](#).

4.3. HBN Default Deployment Configuration

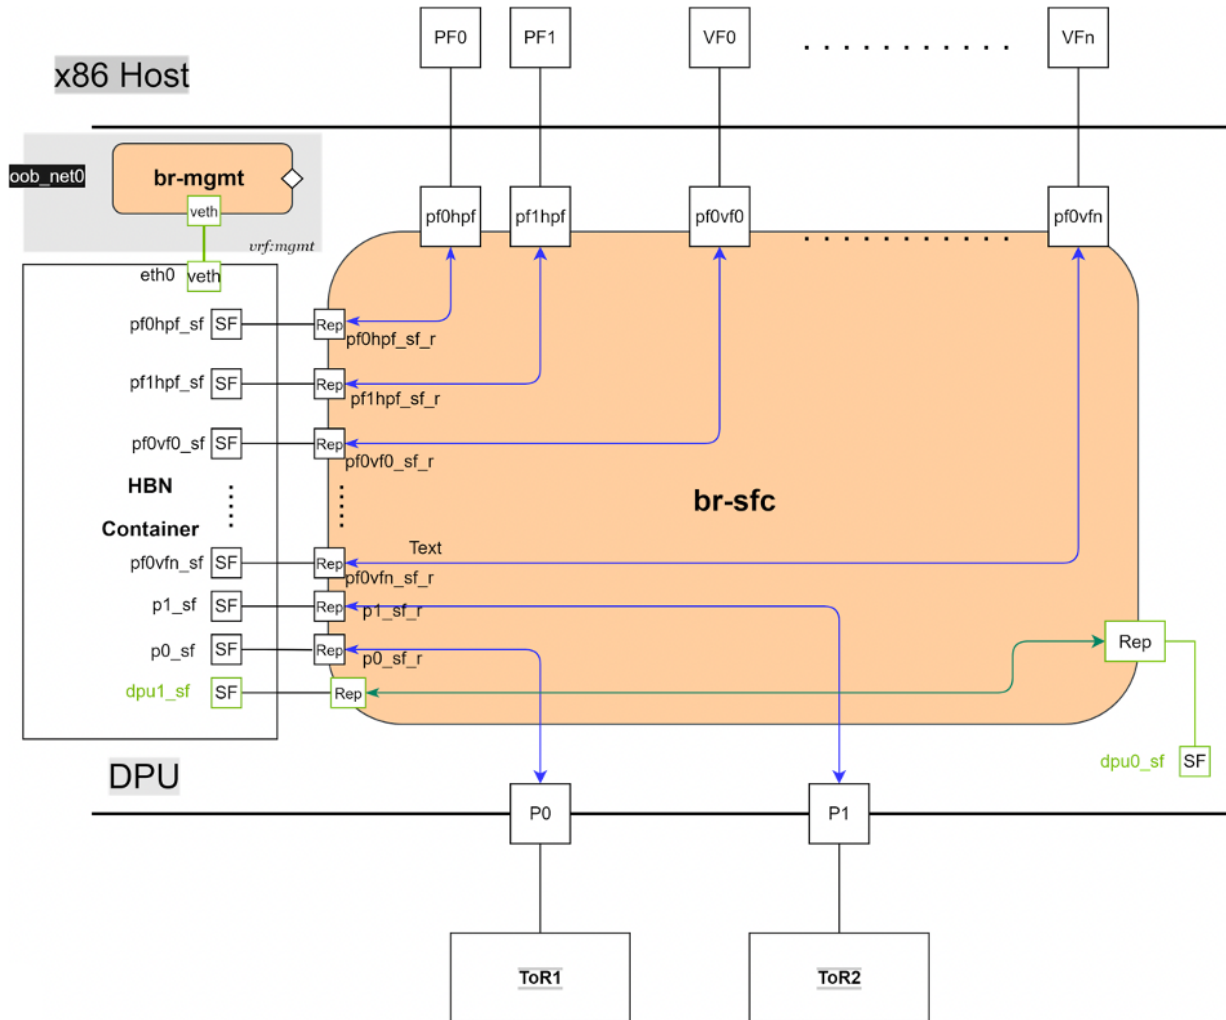

DOCA HBN Service comes with four types of configurable interfaces:

- ▶ Two uplinks (`p0_sf`, `p1_sf`)
- ▶ Two PF port representors (`pf0hpf_sf`, `pf1hpf_sf`)
- ▶ User-defined number of VFs (i.e., `pf0vf0_sf`, `pf0vf1_sf`, ..., `pf1vf0_sf`, `pf1vf1_sf`, ...)
- ▶ One interface to connect to services running on the DPU, outside of the HBN container (`dpu1_sf`)

The `*_sf` suffix indicates that these are sub-functions and are different from the physical uplinks (i.e., PFs, VFs). They can be viewed as virtual interfaces from a virtualized DPU.

Each of these interfaces is connected outside the HBN container to the corresponding physical interface, see section [Service Function Chaining \(SFC\)](#) for more details.

The HBN container runs as an isolated namespace and does not see any interfaces outside the container (`oob_net0`, real uplinks and PFs, `*_sf_r` representors).

`dpu1_sf` is a special interface for HBN to connect to services running on the DPU. Its counterpart `dpu0_sf` is located outside the HBN container. See [Connecting to Services on DPU](#) for deployment considerations when using the `dpu1_sf` interface in HBN.

`eth0` is equivalent to the `oob_net0` interface in the HBN container. It is part of the management VRF of the container. It is not configurable via NVUE and does not need any configuration from the user. See TBD for more details on this interface and the management VRF.

4.4. HBN Deployment Considerations

4.4.1. SF Interface State Tracking

When HBN is deployed with SFC, the interface state of the following network devices is propagated to their corresponding SFs:

- ▶ Uplinks – p0, p1
- ▶ PFs – pf0hpf, pf1hpf
- ▶ VFs – pf0vfX, pf1vfX where X is the VF number

For example, if the p0 uplink cable gets disconnected:

- ▶ p0 transitions to DOWN state with NO-CARRIER (default behavior on Linux); and
- ▶ p0 state is propagated to p0_sf whose state also becomes DOWN with NO-CARRIER

After p0 connection is reestablished:

- ▶ p0 transitions to UP state; and
- ▶ p0 state is propagated to p0_sf whose state becomes UP

Interface state propagation only happens in the uplink/PF/VF-to-SF direction.

A daemon called `sfc-state-propagation` runs on the DPU, outside of the HBN container, to sync the state. The daemon listens to netlink notifications for interfaces and transfers the state to SFs.

4.4.2. SF Interface MTU

In the HBN container, the MTUs of all interfaces are set to 9216 by default. The MTU of specific interfaces can be overridden using flat-files configuration or NVUE.

On the DPU side (i.e., outside of the HBN container), the MTU of the uplinks, PFs, and VFs interfaces are also set to 9216. This can be changed by modifying `/etc/systemd/network/30-hbn-mtu.network` or by adding a new configuration file in the `/etc/systemd/network` for specific directories.

To reload this configuration, execute `systemctl restart systemd-networkd`.

4.4.3. Connecting to Services on DPU

`dpu1_sf` can be used by HBN to connect to services running on the DPU. Its counterpart, `dpu0_sf`, is located outside the HBN container.

Traffic between the DPU and the outside world is not hardware-accelerated in the HBN container when using a native L3 connection over `dpu0_sf/dpu1_sf`. To get hardware-acceleration, configure `dpu1_sf` in the HBN container with `bridge-access` over a switch virtual interface (SVI).

4.4.4. Disabling DPU Uplinks

The uplink ports must be always kept administratively up for proper operation of HBN. Otherwise, the NVIDIA® ConnectX® firmware would bring down the corresponding representor port which would cause data forwarding to stop.

Note: Change in operational status of uplink (e.g., carrier down) would result in traffic being switched to the other uplink.

When using ECMP failover on the two uplink SFs, locally disabling one uplink does not result in traffic switching to the second uplink. Disabling local link in this case means to set one uplink admin DOWN directly on the DPU.

To test ECMP failover scenarios correctly, the uplink must be disabled from its remote counterpart (i.e., execute admin DOWN on the remote system's link which is connected to the uplink).

Chapter 5. Configuration

5.1. General Network Configuration

5.1.1. Flat Files Configuration

Add network interfaces and FRR configuration files on the DPU to achieve the desired configuration:

- ▶ `/etc/network/interfaces`

Note: Refer to [NVIDIA® Cumulus® Linux documentation](#) for more information.

- ▶ `/etc/frr/frr.conf; /etc/frr/daemons`

Note: Refer to [NVIDIA® Cumulus® Linux documentation](#) for more information.

5.2. NVUE Configuration

This chapter assumes familiarity with [NVIDIA user experience \(NVUE\) Cumulus Linux documentation](#). The following subsections, only expand on DPU-specific aspects of NVUE.

5.2.1. NVUE Service

HBN installs NVUE by default and enables NVUE service at boot.

5.2.2. NVUE REST API

HBN enables REST API by default.

Users may run the cURL commands from the command line. Use the default HBN username `nvidia` and password `nvidia`.

To change the default password of the `nvidia` user or add additional users for NVUE access, refer to [NVUE User Credentials](#).

REST API example:

```
curl -u 'nvidia:nvidia' --insecure https://10.188.108.58:8765/nvue_v1/interface/p0
{
  "ip": {
    "address": {
      "30.0.0.1/24": {}
    }
  },
  "link": {
    "auto-negotiate": "on",
    "duplex": "full",
    "fec": "auto",
    "mac": "b8:ce:f6:a8:83:9a",
    "mtu": 9216,
    "speed": "100G",
    "state": {
      "up": {}
    }
  },
  "stats": {
    "carrier-transitions": 13,
    "in-bytes": 0,
    "in-drops": 0,
    "in-errors": 0,
    "in-pkts": 0,
    "out-bytes": 14111,
    "out-drops": 0,
    "out-errors": 0,
    "out-pkts": 161
  }
},
  "pluggable": {
    "identifier": "QSFP28",
    "vendor-name": "Mellanox",
    "vendor-pn": "MCP1600-C00AE30N",
    "vendor-rev": "A4",
    "vendor-sn": "MT2105VB02844"
  },
  "type": "swp"
}
```

Note: For information about using the NVUE REST API, refer to the [NVUE API documentation](#).

5.2.3. NVUE CLI

For information about using the NVUE CLI, refer to the [NVUE CLI documentation](#).

5.2.4. NVUE Startup Configuration File

When the network configuration is saved using NVUE, HBN writes the configuration to the `/etc/nvue.d/startup.yaml` file.

Startup configuration is applied by following the supervisor daemon at boot time. `nvued-startup` will appear in `EXITED` state after applying the startup configuration.

```
# supervisorctl status nvued-startup
```

```
nvued-startup                               EXITED   Apr 17 10:04 AM
```

Note: `nv config apply startup` applies the yaml configuration saved at `/etc/nvue.d/`.

Note: `nv config save` saves the running configuration to `/etc/nvue.d/startup.yaml`.

5.2.5. NVUE User Credentials

NVUE user credentials can be added post installation. This functionality is enabled by the HBN startup script by using the `--username` and `--password` script switches. For example:

```
./hbn-dpu-setup.sh -u newuser -p newpassword
```

After executing this script, respawn the container or start the `decrypt-user-add` script:

```
supervisorctl start decrypt-user-add
decrypt-user-add: started
```

The script creates a user on the HBN container:

```
cat /etc/passwd | grep newuser
newuser:x:1001:1001::/home/newuser:/bin/bash
```

5.2.6. NVUE Interface Classification

Interface	Interface Type	NVUE Type	Comment
p0_sf	Uplink representor	swp	Use type swp
p1_sf	Uplink representor	swp	Use type swp
lo	Loopback	loopback	Tested with NVUE
pf0hpf_sf	Host representor	swp	Use type swp
pf1hpf_sf	Host representor	swp	Use type swp
pf0vfx_sf (where x is 0 to 255)	VF representor	swp	Use type swp
pf1vfx_sf (where x is 0 to 255)	VF representor	swp	Use type swp

5.3. Configuration Persistence

The following directories are mounted from the host DPU to the HBN container and are persistent across HBN restarts and DPU reboots:

Host DPU Mount Point	HBN Container Mount Point
Configuration Files Mount Pints	
<code>/var/lib/hbn/etc/network/</code>	<code>/etc/network/</code>
<code>/var/lib/hbn/etc/frr/</code>	<code>/etc/frr/</code>
<code>/var/lib/hbn/etc/nvue.d/</code>	<code>/etc/nvue.d/</code>
<code>/var/lib/hbn/etc/supervisor/conf.d/</code>	<code>/etc/supervisor/conf.d/</code>

Host DPU Mount Point	HBN Container Mount Point
/var/lib/hbn/var/lib/nvue/ Support and Log Files Mount Points	/var/lib/nvue/
/var/lib/hbn/var/support/	/var/support/
/var/log/doca/hbn/	/var/log/hbn/

5.4. SR-IOV Support

5.4.1. Creating VFs on Host Server

The first step to use SR-IOV is to create VFs on the host server. VFs can be created using the following command:

```
echo N > /sys/class/net/<host-rep>/device/sriov_numvfs
```

Where:

- ▶ <host-rep> is one of the two host representors (e.g., ens1f0 or ens1f1)
- ▶ $0 \leq N \leq 16$ is the desired total number of VFs
 - ▶ Set $N=0$ to delete all the VFs on $0 \leq N \leq 16$
 - ▶ $N=16$ is the maximum number of VFs supported on HBN across all representors

5.4.2. Automatic Creation of VF Representors on DPU

VFs created on the host must have corresponding SF representors on the DPU side. For example:

- ▶ ens1f0vf0 is the first VF from the first host representor; this interface is created on the host server
- ▶ pf0vf0 is the corresponding VF representor to ens1f0vf0; this interface is on the DPU and automatically created at the same time as en1sf0vf0 is created
- ▶ pf0vf0_sf is the corresponding SF for pf0vf0 which is used by HBN

The creation of the SF representor for VFs is done ahead of time when installing the BFB, see section [Enabling SFC for HBN Deployment](#) to see how to select how many SFs to create ahead of time.

The SF representors for VFs (i.e., pfXvfY) are pre-mapped to work with the corresponding VF representors when these are created with the command from section [Creating VFs on Host Server](#).

5.5. Management VRF

Two management VRFs are setup for HBN with SFC:

- ▶ The first management VRF is outside the HBN container on the DPU. This VRF provides separation between out-of-band (OOB) traffic (via `oob_net0` or `tmfifo_net0`) and data-plane traffic via uplinks and PFs.
- ▶ The second management VRF is inside the HBN container and provides similar separation. The OOB traffic (via `eth0`) is isolated from the traffic via the `*_sf` interfaces.

5.5.1. MGMT VRF on Host DPU

The management (mgmt) VRF is enabled by default when the DPU is deployed with SFC (see [Enabling SFC for HBN Deployment](#)). The mgmt VRF provides separation between the out-of-band management network and the in-band data plane network.

The uplinks and PFs/SFs/VFs use the default routing table while the `oob_net0` (out-of-band Ethernet port) and the `tmfifo_net0` netdevices use the mgmt VRF to route their packets.

When logging in either via SSH or the console, the shell is by default in mgmt VRF context. This is indicated by a `mgmt` added to the shell prompt:

```
root@bf2:mgmt:/home/ubuntu#
```

When logging into the HBN container with `crictl`, the HBN shell will be in the default VRF. Users must switch to mgmt VRF manually if out-of-band access is required. Use `ip vrf exec` to do so.

```
root@bf2:mgmt:/home/ubuntu# ip vrf exec mgmt bash
```

The user must run `ip vrf exec mgmt` to perform other operations (e.g., `apt-get update`).

Network devices belonging to the mgmt VRF can be listed with the `vrf` utility:

```
root@bf2:mgmt:/home/ubuntu# vrf link list

VRF: mgmt
-----
tmfifo_net0      UP          00:1a:ca:ff:ff:03 <BROADCAST,MULTICAST,UP,LOWER_UP>
oob_net0        UP          08:c0:eb:c0:5a:32 <BROADCAST,MULTICAST,UP,LOWER_UP>

root@bf2:mgmt:/home/ubuntu# vrf help
vrf <OPTS>

VRF domains:
  vrf list

Links associated with VRF domains:
  vrf link list [<vrf-name>]

Tasks and VRF domain association:
  vrf task exec <vrf-name> <command>
  vrf task list [<vrf-name>]
  vrf task identify <pid>

NOTE: This command affects only AF_INET and AF_INET6 sockets opened by the
      command that gets exec'ed. Specifically, it has *no* impact on netlink
```

```
sockets (e.g., ip command).
```

To show the routing table for the default VRF, run:

```
root@bf2:mgmt:/home/ubuntu# ip route show
```

To show the routing table for the mgmt VRF, run:

```
root@bf2:mgmt:/home/ubuntu# ip route show vrf mgmt
```

5.5.2. MGMT VRF in HBN Container

Inside the HBN container, a separate mgmt VRF is present. Similar commands as those listed under [MGMT VRF on Host DPU](#) can be used to query management routes.

The *_sf interfaces use the default routing table while the eth0 (OOB) uses the mgmt VRF to route out-of-band packets out of the container. The OOB traffic gets NATed through the DPU oob_net0 interface, ultimately using the DPU OOB's IP address.

When logging into the HBN container via `crictl`, the shell enters the default VRF context by default. Switching to the mgmt VRF can be done using the command `ip vrf exec mgmt <cmd>`.

5.5.3. Existing Services in MGMT VRF on Host DPU

On the host DPU, outside the HBN container, a set of existing services run in the mgmt VRF context as they need OOB network access:

- ▶ containerd
- ▶ kubelet
- ▶ ssh
- ▶ docker

These services can be restarted and queried for their status using the command `systemctl` while adding `@mgmt` to the original service name. For example:

- ▶ To restart containerd:

```
root@bf2:mgmt:/home/ubuntu# systemctl restart containerd@mgmt
```

- ▶ To query containerd status:

```
root@bf2:mgmt:/home/ubuntu# systemctl status containerd@mgmt
```

Note: The original version of these services (without `@mgmt`) are not used and must not be started.

5.5.4. Running New Service in MGMT VRF

If a service needs OOB access to run, it can be added to the set of services running in mgmt VRF context. Adding such a service is only possible on the host DPU (i.e., outside the HBN container).

To add a service to the set of MGMT VRF services:

1. Add it to `/etc/vrf/systemd.conf` (if it is not present already). For example, NTP is already listed in this file.

2. Run the following:

```
root@bf2:mgmt:/home/ubuntu# systemctl daemon-reload
```

3. Stop and disable to the non-VRF version of the service to be able to start the mgmt VRF one:

```
root@bf2:mgmt:/home/ubuntu# systemctl stop ntp
root@bf2:mgmt:/home/ubuntu# systemctl disable ntp
root@bf2:mgmt:/home/ubuntu# systemctl enable ntp@mgmt
root@bf2:mgmt:/home/ubuntu# systemctl start ntp@mgmt
```

5.6. HBN Configuration Examples

5.6.1. HBN Default Configuration

After a fresh HBN installation, the default `/etc/network/interfaces` file would contain only the declaration of the two uplink SFs and a default bridge to which interfaces can be added manually or via NVUE.

```
auto p0_sf
iface p0_sf

auto p1_sf
iface p1_sf

auto br_default
iface br_default
    bridge-vlan-aware yes
```

FRR configuration files would also be present under `/etc/frr/` but no configuration would be enabled.

5.6.2. Native Routing with BGP and ECMP

HBN supports unicast routing with BGP and ECMP for IPv4 and IPv6 traffic. ECMP is achieved by distributing traffic per destination prefix in a round-robin fashion.

5.6.2.1. ECMP Configuration

ECMP is implemented any time routes have multiple paths over uplinks. For example:

```
20.20.20.0/24 proto bgp metric 20
    nexthop via 169.254.0.1 dev p0_sf weight 1 onlink <<<< via uplink p0_sf
    nexthop via 169.254.0.1 dev p1_sf weight 1 onlink <<<< via uplink p1_sf
```

5.6.2.1.1. Sample NVUE Configuration

```
nv set interface lo ip address 10.10.10.1/32
nv set interface lo ip address 2010:10:10::1/128
nv set interface vlan100 type svi
nv set interface vlan100 vlan 100
nv set interface vlan100 base-interface br_default
nv set interface vlan100 ip address 2030:30:30::1/64
nv set interface vlan100 ip address 30.30.30.1/24
nv set bridge domain br_default vlan 100
```

```

nv set interface pf0hpf_sf,pflhpf_sf bridge domain br_default
nv set vrf default router bgp router-id 10.10.10.1
nv set vrf default router bgp autonomous-system 65501
nv set vrf default router bgp path-selection multipath aspath-ignore on
nv set vrf default router bgp address-family ipv4-unicast enable on
nv set vrf default router bgp address-family ipv4-unicast redistribute connected
  enable on
nv set vrf default router bgp address-family ipv6-unicast enable on
nv set vrf default router bgp address-family ipv6-unicast redistribute connected
  enable on
nv set vrf default router bgp neighbor p0_sf remote-as external
nv set vrf default router bgp neighbor p0_sf type unnumbered
nv set vrf default router bgp neighbor p0_sf address-family ipv4-unicast enable on
nv set vrf default router bgp neighbor p0_sf address-family ipv6-unicast enable on
nv set vrf default router bgp neighbor p1_sf remote-as external
nv set vrf default router bgp neighbor p1_sf type unnumbered
nv set vrf default router bgp neighbor p1_sf address-family ipv4-unicast enable on
nv set vrf default router bgp neighbor p1_sf address-family ipv6-unicast enable on

```

5.6.2.1.2. Sample Flat Files Configuration

Example /etc/network/interfaces configuration:

```

auto lo
iface lo inet loopback
    address 10.10.10.1/32
    address 2010:10:10::1/128

auto p0_sf
iface p0_sf

auto p1_sf
iface p1_sf

auto pf0hpf_sf
iface pf0hpf_sf

auto pflhpf_sf
iface pflhpf_sf

auto vlan100
iface vlan100
    address 2030:30:30::1/64
    address 30.30.30.1/24
    vlan-raw-device br_default
    vlan-id 100

auto br_default
iface br_default
    bridge-ports pf0hpf_sf pflhpf_sf
    bridge-vlan-aware yes
    bridge-vids 100
    bridge-pvid 1

```

Example /etc/frr/daemons configuration:

```

bgpd=yes
vtysh_enable=yes

FRR Config file @ /etc/frr/frr.conf -
!
frr version 7.5+c15.3.0u0
frr defaults datacenter
hostname BLUEFIELD2
log syslog informational
no zebra nexthop kernel enable
!

```

```

router bgp 65501
  bgp router-id 10.10.10.1
  bgp bestpath as-path multipath-relax
  neighbor p0_sf interface remote-as external
  neighbor p0_sf advertisement-interval 0
  neighbor p0_sf timers 3 9
  neighbor p0_sf timers connect 10
  neighbor p1_sf interface remote-as external
  neighbor p1_sf advertisement-interval 0
  neighbor p1_sf timers 3 9
  neighbor p1_sf timers connect 10

    redistribute connected
    neighbor p0_sf activate
    neighbor p1_sf activate
    maximum-paths 64
    maximum-paths ibgp 64
  exit-address-family
  !
line vty
!
end

```

5.6.2.2. BGP Peering with Host

HBN supports the ability to establish a BGP session between the host and DPU and allow the host to announce arbitrary route prefixes through the DPU into the underlay fabric. The host can use any standard BGP protocol stack implementation to establish BGP peering with HBN.

Note: Traffic to and from endpoints on the host gets offloaded.

Note: Both IPv4 and IPv6 unicast AFI/SAFI are supported.

It is possible to apply route filtering for these prefixes to limit the potential security impact in this configuration.

5.6.2.2.1. Sample NVUE Configuration

The following code block shows configuration to peer to host at 45.3.0.4 and 2001:cafe:lead::4. The BGP session can be established using IPv4 or IPv6 address.

Note: Either of these sessions can support IPv4 unicast and IPv6 unicast AFI/SAFI.

NVUE configuration for peering with host:

```

nv set vrf default router bgp autonomous-system 63642
nv set vrf default router bgp enable on
nv set vrf default router bgp neighbor 45.3.0.4 nexthop-connected-check off
nv set vrf default router bgp neighbor 45.3.0.4 peer-group dpu_host
nv set vrf default router bgp neighbor 45.3.0.4 type numbered

```

```

nv set vrf default router bgp neighbor 2001:cafe:lead::4 nexthop-connected-check off
nv set vrf default router bgp neighbor 2001:cafe:lead::4 peer-group dpu_host
nv set vrf default router bgp neighbor 2001:cafe:lead::4 type numbered
nv set vrf default router bgp peer-group dpu_host address-family ipv4-unicast enable
on
nv set vrf default router bgp peer-group dpu_host address-family ipv6-unicast enable
on
nv set vrf default router bgp peer-group dpu_host remote-as external

```

5.6.2.2.2. Sample Flat Files Configuration

The following block shows configuration to peer to host at 45.3.0.4 and 2001:cafe:lead::4. The BGP session can be established using IPv4 or IPv6 address.

frr.conf file:

```

router bgp 63642
  bgp router-id 27.0.0.4
  bgp bestpath as-path multipath-relax
  neighbor dpu_host peer-group
  neighbor dpu_host remote-as external
  neighbor dpu_host bfd 3 1000 1000
  neighbor dpu_host advertisement-interval 0
  neighbor dpu_host timers 3 9
  neighbor dpu_host timers connect 10
  neighbor fabric peer-group
  neighbor fabric remote-as external
  neighbor fabric bfd 3 1000 1000
  neighbor fabric advertisement-interval 0
  neighbor fabric timers 3 9
  neighbor fabric timers connect 10
  neighbor 45.3.0.4 peer-group dpu_host
  neighbor 45.3.0.4 disable-connected-check
  neighbor 45.3.0.4 advertisement-interval 0
  neighbor 45.3.0.4 timers 3 9
  neighbor 45.3.0.4 timers connect 10
  neighbor 2001:cafe:lead::4 peer-group dpu_host
  neighbor 2001:cafe:lead::4 disable-connected-check
  neighbor 2001:cafe:lead::4 advertisement-interval 0
  neighbor 2001:cafe:lead::4 timers 3 9
  neighbor 2001:cafe:lead::4 timers connect 10
  neighbor p0_sf interface peer-group fabric
  neighbor p0_sf advertisement-interval 0
  neighbor p0_sf timers 3 9
  neighbor p0_sf timers connect 10
  neighbor p1_sf interface peer-group fabric
  neighbor p1_sf advertisement-interval 0
  neighbor p1_sf timers 3 9
  neighbor p1_sf timers connect 10
  !
  address-family ipv4 unicast
  neighbor dpu_host activate
  !
  address-family ipv6 unicast
  neighbor dpu_host activate

```

5.6.2.2.3. Sample Configuration on Host Running FRR

Any BGP implementation can be used on the host to peer to HBN and advertise endpoints. The following is an example using FRR BGP.

- Sample FRR configuration on the host:

```

bf2-s12# sh run
Building configuration...

```

```

Current configuration:
!
frr version 7.2.1
frr defaults traditional
hostname bf2-s12
no ip forwarding
no ipv6 forwarding
!
router bgp 1000008
!
router bgp 1000008 vrf v_200_2000
neighbor 45.3.0.2 remote-as external
neighbor 2001:cafe:lead::2 remote-as external
!
address-family ipv4 unicast
  redistribute connected
exit-address-family
!
address-family ipv6 unicast
  redistribute connected
  neighbor 45.3.0.2 activate
  neighbor 2001:cafe:lead::2 activate
exit-address-family
!
line vty
!
end

```

► **Sample FRR configuration on host:**

```

bf2-s12# sh run
Building configuration...

Current configuration:
!
frr version 7.2.1
frr defaults traditional
hostname bf2-s12
no ip forwarding
no ipv6 forwarding
!
router bgp 1000008
!
router bgp 1000008 vrf v_200_2000
neighbor 45.3.0.2 remote-as external
neighbor 2001:cafe:lead::2 remote-as external
!
address-family ipv4 unicast
  redistribute connected
exit-address-family
!
address-family ipv6 unicast
  redistribute connected
  neighbor 45.3.0.2 activate
  neighbor 2001:cafe:lead::2 activate
exit-address-family
!
line vty
!
end

```

► **Sample interface configuration on the host:**

```

root@bf2-s12:/home/cumulus# ifquery -a
auto lo
iface lo inet loopback
  address 27.0.0.7/32
  address 2001:c15c:d06:f00d::7/128
auto v_200_2000

```

```

iface v_200_2000
  address 60.1.0.1
  address 60.1.0.2
  address 60.1.0.3
    address 2001:60:1::1
  address 2001:60:1::2
  address 2001:60:1::3
    vrf-table auto
auto ens1f0np0
iface ens1f0np0
  address 45.3.0.4/24
  address 2001:cafe:lead::4/64
  gateway 45.3.0.1
  gateway 2001:cafe:lead::1
  vrf v_200_2000
  hwaddress 00:03:00:08:00:12
  mtu 9162

```

5.6.3. L2 EVPN with BGP and ECMP

HBN supports VXLAN with EVPN control plane for intra-subnet bridging (L2) services for IPv4 and IPv6 traffic in the overlay.

For the underlay, only IPv4 or BGP unnumbered configuration is supported.

The following is a sample config which has L2-VNIs (vx-2000, vx-2001) for EVPN bridging.

5.6.3.1. Single VXLAN Device

With a single VXLAN device, a set of VNIs represents a single device model. The single VXLAN device has a set of attributes that belong to the VXLAN construct. Individual VNIs include VLAN-to-VNI mapping which allows users to specify which VLANs are associated with which VNIs. A single VXLAN device simplifies the configuration and reduces the overhead by replacing multiple traditional VXLAN devices with a single VXLAN device.

Users may configure a single VXLAN device automatically with NVUE, or manually by editing the `/etc/network/interfaces` file. When users configure a single VXLAN device with NVUE, NVUE creates a unique name for the device in the following format using the bridge name as the hash key: `vxlan<id>`.

This example configuration performs the following steps:

1. Creates a single VXLAN device (vxlan21).
2. Maps VLAN 10 to VNI 10 and VLAN 20 to VNI 20.
3. Adds the VXLAN device to the default bridge.

```

cumulus@leaf01:~$ nv set bridge domain bridge vlan 10 vni 10
cumulus@leaf01:~$ nv set bridge domain bridge vlan 20 vni 20
cumulus@leaf01:~$ nv set nve vxlan source address 10.10.10.1
cumulus@leaf01:~$ nv config apply

```

Alternately, users may edit the file `/etc/network/interfaces` as follows, then run the `ifreload -a` command to apply the SVD configuration.

```

auto lo
iface lo inet loopback
    vxlan-local-tunnelip 10.10.10.1

auto vxlan21

```

```

iface vxlan21
    bridge-vlan-vni-map 10=10 20=20
    bridge-learning off

auto bridge
iface bridge
    bridge-vlan-aware yes
    bridge-ports vxlan21 pf0hpf_sf pflhpf_sf
    bridge-vids 10 20
    bridge-pvid 1

```

Note: Users may not use a combination of single and traditional VXLAN devices.

5.6.3.2. Sample NVUE Configuration

```

nv set bridge domain br_default encap 802.1Q
nv set bridge domain br_default type vlan-aware
nv set bridge domain br_default vlan 200 vni 2000 flooding enable auto

5.6.4. Access Control Lists

Access Control Lists (ACLs) are a set of rules that are used to filter network traffic. These rules are used to specify the traffic flows that must be permitted or blocked at networking device interfaces. There are two types of ACLs:

- ▶ Stateless ACLs – rules that are applied to individual packets. They inspect each packet individually and permit/block the packets based on the packet header information and the match criteria specified by the rule.
- ▶ Stateful ACLs – rules that are applied to traffic sessions/connections. They inspect each packet with respect to the state of the session/connection to which the packet belongs to determine whether to permit/block the packet.

5.6.4.1. ACL Priorities

HBN supports ACL priorities to ensure that the order in which ACLs are executed in DPU hardware is the same as the order in which the ACLs are configured. HBN supports 8 priority buckets and ACLs can be assigned to any of them. The rules with lower priority value (higher priority) are matched before the rules with higher priority value (lower priority).

With NVUE, rule ID ranges map to the eight ACL hardware priority buckets as shown in the following table:

Rule ID Range	Priority
1-8000	1
8001-16000	2
16001-24000	3
24001-32000	4
32001-40000	5
40001-48000	6
48001-56000	7
56001-64000	8

The ACL priorities are explained further in the following sections on stateless and stateful ACLs along with examples.

Note: ACL priorities are applicable only for IPv4 and IPv6 ACLs.

5.6.4.2. Stateless ACLs

HBN supports configuration of stateless ACLs for IPv4 packets, IPv6 packets, and Ethernet frames. The following examples depict how stateless ACLs are configured for each case, with NVUE and with flat files (`cl-acltool`).

5.6.4.2.1. NVUE Examples for Stateless ACLs

NVUE IPv4 ACLs Example

The following is an example of an ingress IPv4 ACL that permits DHCP request packets ingressing on the `pf0hpf_sf` port towards the DHCP server:

```
root@hbn01-host01:~# nv set acl acl1_ingress type ipv4
root@hbn01-host01:~# nv set acl acl1_ingress rule 100 match ip protocol udp
root@hbn01-host01:~# nv set acl acl1_ingress rule 100 match ip dest-port 67
root@hbn01-host01:~# nv set acl acl1_ingress rule 100 match ip source-port 68
root@hbn01-host01:~# nv set acl acl1_ingress rule 100 action permit
```

Note: This ACL is configured at priority 1 since rule ID 100 is in the range 1-8000 (see the ACL rule ID to priority mapping table under section [ACL Priorities](#)).

Bind the ingress IPv4 ACL to host representor port `pf0hpf_sf` of the DPU in the inbound direction:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl1_ingress inbound
root@hbn01-host01:~# nv config apply
```

The following is an example of an egress IPv4 ACL that permits DHCP reply packets egressing out of the `pf0hpf_sf` port towards the DHCP client:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl1_ingress inbound
root@hbn01-host01:~# nv config apply
```

Note: This ACL is configured at priority 2 since rule ID 1000 is in the range 8001-16000 (see the ACL rule ID to priority mapping table under section [ACL Priorities](#)).

Bind the egress IPv4 ACL to host representor port `pf0hpf_sf` of the DPU in the outbound direction:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl2_egress outbound
root@hbn01-host01:~# nv config apply
```

NVUE IPv6 ACLs Example

The following is an example of an ingress IPv6 ACL that permits traffic with matching `dest-ip` and `protocol tcp` ingress on port `pf0hpf_sf`:

```
root@hbn01-host01:~# nv set acl acl5_ingress type ipv6
root@hbn01-host01:~# nv set acl acl5_ingress rule 20000 match ip protocol tcp
root@hbn01-host01:~# nv set acl acl5_ingress rule 20000 match ip dest-ip
48:2034::80:9
root@hbn01-host01:~# nv set acl acl5_ingress rule 20000 action permit
```

Note: This ACL is configured at priority 3 since rule ID 20000 is in the range 16001-24000 (see the ACL rule ID to priority mapping table under section [ACL Priorities](#)).

Bind the ingress IPv6 ACL to host representor port `pf0hpf_sf` of the DPU in the inbound direction:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl5_ingress inbound
root@hbn01-host01:~# nv config apply
```

The following is an example of an egress IPv6 ACL that permits traffic with matching `source-ip` and `protocol tcp` egressing out of port `pf0hpf_sf`:

```
root@hbn01-host01:~# nv set acl acl6_egress type ipv6
root@hbn01-host01:~# nv set acl acl6_egress rule 1 match ip protocol tcp
root@hbn01-host01:~# nv set acl acl6_egress rule 1 match ip source-ip 48:2034::80:9
root@hbn01-host01:~# nv set acl acl6_egress rule 1 action permit
```

Note: This ACL is configured at priority 1 since rule ID 1 is in the range 1-8000 (see the ACL rule ID to priority mapping table under section [ACL Priorities](#)).

Bind the egress IPv6 ACL to host representor port `pf0hpf_sf` of the DPU in the outbound direction:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl6_egress outbound
root@hbn01-host01:~# nv config apply
```

NVUE L2 ACLs Example

The following is an example of an ingress MAC ACL that permits traffic with matching `source-mac` and `dest-mac` ingressing to port `pf0hpf_sf`:

```
root@hbn01-host01:~# nv set acl acl3_ingress type mac
root@hbn01-host01:~# nv set acl acl3_ingress rule 1 match mac source-mac
00:00:00:00:00:0a
root@hbn01-host01:~# nv set acl acl3_ingress rule 1 match mac dest-mac
00:00:00:00:00:0b
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl3_ingress inbound
```

Bind the ingress MAC ACL to host representor port `pf0hpf_sf` of the DPU in the inbound direction:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl3_ingress inbound
root@hbn01-host01:~# nv config apply
```

The following is an example of an egress MAC ACL that permits traffic with matching `source-mac` and `dest-mac` egressing out of port `pf0hpf_sf`:

```
root@hbn01-host01:~# nv set acl acl4_egress type mac
```

```
root@hbn01-host01:~# nv set acl acl4_egress rule 60000 match mac source-mac
00:00:00:00:00:0b
root@hbn01-host01:~# nv set acl acl4_egress rule 60000 match mac dest-mac
00:00:00:00:00:0a
root@hbn01-host01:~# nv set acl acl4_egress rule 60000 action permit
```

Bind the egress MAC ACL to host representor port `pf0hpf_sf` of the DPU in the outbound direction:

```
root@hbn01-host01:~# nv set interface pf0hpf_sf acl acl4_egress outbound
root@hbn01-host01:~# nv config apply
```

5.6.4.2.2. Flat Files (cl-acltool) Examples for Stateless ACLs

For the same examples cited above, the following are the corresponding ACL rules which must be configured under `/etc/cumulus/acl/policy.d/<rule_name.rules>` followed by invoking `cl-acltool -i`. The rules in `/etc/cumulus/acl/policy.d/<rule_name.rules>` are configured using Linux iptables/ip6tables/ebtables.

Flat Files IPv4 ACLs Example

The following example configures an ingress IPv4 ACL rule matching with DHCP request under `/etc/cumulus/acl/policy.d/<rule_name.rules>` with the ingress interface as the host representor of the DPU followed by invoking `cl-acltool -i`:

```
[iptables]
## ACL acl1_ingress in dir inbound on interface pf0hpf_sf ##
-t filter -A FORWARD -i pflvfl_sf -p udp --sport 68 --dport 67 -m comment --
comment "priority:1" -j ACCEPT
```

Note: The above ACL rule is configured at priority 1 due to the the comment options used (`-m comment --comment "priority:1"`).

The following example configures an egress IPv4 ACL rule matching with DHCP reply under `/etc/cumulus/acl/policy.d/<rule_name.rules>` with the egress interface as the host representor of the DPU followed by invoking `cl-acltool -i`:

```
[iptables]
## ACL acl2_egress in dir outbound on interface pf0hpf_sf ##
-t filter -A FORWARD -o pf0hpf_sf -p udp --sport 67 --dport 68 -m comment --
comment "priority:2" -j ACCEPT
```

Note: The above ACL rule is configured at priority 2 due to the the comment options used (`-m comment --comment "priority:2"`).

Flat File IPv6 ACLs Example

The following example configures an ingress IPv6 ACL rule matching with `dest-ip` and `tcp` protocol under `/etc/cumulus/acl/policy.d/<rule_name.rules>` with the ingress interface as the host representor of the DPU followed by invoking `cl-acltool -i`:

```
[ip6tables]
## ACL acl5_ingress in dir inbound on interface pf0hpf_sf ##
-t filter -A FORWARD -i pf0hpf_sf -d 48:2034::80:9 -p tcp -m comment --
comment "priority:3" -j ACCEPT
```

Note: The above ACL rule is configured at priority 3 due to the the comment options used (`-m comment --comment "priority:3"`).

The following example configures an egress IPv6 ACL rule matching with `source-ip` and `tcp` protocol under `/etc/cumulus/acl/policy.d/<rule_name.rules>` with the egress interface as the host representor of the DPU followed by invoking `cl-acltool -i`:

```
[ip6tables]
## ACL acl6_egress in dir outbound on interface pf0hpf_sf ##
-t filter -A FORWARD -o pf0hpf_sf -s 48:2034::80:9 -p tcp -m comment --
comment "priority:1" -j ACCEPT
```

Note: The above ACL rule would be configured at priority 1 using the comment options (`-m comment --comment "priority:1"`).

Flat Files L2 ACLs Example

The following example configures an ingress MAC ACL rule matching with `source-mac` and `dest-mac` under `/etc/cumulus/acl/policy.d/<rule_name.rules>` with the ingress interface as the host representor of the DPU followed by invoking `cl-acltool -i`:

```
[eatables]
## ACL acl3_ingress in dir inbound on interface pf0hpf_sf ##
-t filter -A FORWARD -i pf0hpf_sf -s 00:00:00:00:00:0a/ff:ff:ff:ff:ff:ff -d
00:00:00:00:00:0b/ff:ff:ff:ff:ff:ff -j ACCEPT
```

The following example configures an egress MAC ACL rule matching with `source-mac` and `dest-mac` under `/etc/cumulus/acl/policy.d/<rule_name.rules>` with egress interface as host representor of DPU followed by invoking `cl-acltool -i`:

```
[eatables]
## ACL acl4_egress in dir outbound on interface pf0hpf_sf ##
-t filter -A FORWARD -o pf0hpf_sf -s 00:00:00:00:00:0b/ff:ff:ff:ff:ff:ff -d
00:00:00:00:00:0a/ff:ff:ff:ff:ff:ff -j ACCEPT
```

5.6.4.3. Stateful ACLs

Stateful ACLs facilitate monitoring and tracking traffic flows to enforce per-flow traffic filtering (unlike stateless ACLs which filter traffic on a per-packet basis). HBN supports stateful ACLs using reflexive ACL mechanism. Reflexive ACL mechanism is used to permit initiation of connections from within the network to outside the network and allow only replies to the initiated connections from outside the network.

HBN supports stateful ACL configuration for IPv4 traffic.

Stateful ACLs can be applied for routed traffic (north-south traffic) or bridged traffic (east-west traffic). Stateful ACLs applied for routed traffic are called "L3 stateful ACLs" and for bridged traffic are called "L2 stateful ACLs". Currently, NVUE-based configuration is supported only for L3 stateful ACLs (L2 stateful ACLs must be configured using flat-file configuration).

Stateful ACLs in HBN are disabled by default. To enable stateful ACL functionality, use the following NVUE commands:

```
root@hbn03-host00:~# nv set system reflexive-acl enable
root@hbn03-host00:~# nv config apply
```

If using flat-file configuration (and not NVUE), edit the file `/etc/cumulus/nl2docad.d/acl.conf` and set the knob `rflx.reflexive_acl_enable` to `TRUE`. To apply this change, execute:

```
root@hbn03-host00:~# supervisorctl start nl2doca-reload
```

HBN supports addition of implicit deny rules during hardware initialization to prevent traffic forwarding unless explicitly allowed via stateful ACL configuration. To enable addition of implicit deny rules (disabled by default), edit the file `/etc/cumulus/nl2docad.conf`, uncomment the line with the knob `acl.implicit_deny_rules_enable`, and set its value to `TRUE`. To apply this change, execute:

```
root@hbn03-host00:~# supervisorctl restart nl2doca
```

5.6.4.3.1. NVUE Examples for L3 Stateful ACLs

The following is an example of allowing HTTP (TCP) connection originated by the host where the DPU is hosted to an HTTP server (with the IP address 11.11.11.11) on an external network. Two sets of ACLs matching with CONNTRACK state must be configured for a CONNTRACK entry to be established in the kernel which would be offloaded to hardware:

- ▶ Configure an ACL rule matching TCP/HTTP connection/flow details with CONNTRACK state of NEW, ESTABLISHED and bind it to the host representor of the DPU and the associated VLAN's SVI in the inbound direction.
- ▶ Configure an ACL rule matching TCP/HTTP connection/flow details with CONNTRACK state of ESTABLISHED and bind it to the host representor of the DPU and the associated VLAN's SVI in the outbound direction.

In this example, the host representor on the DPU is `pf0hpf_sf` and it is part of VLAN 101 (SVI interface is `vlan101`).

1. Configure the ingress ACL rule:

```
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host rule 11 action permit
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host rule 11 match conntack
new
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host rule 11 match conntack
established
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host rule 11 match ip dest-ip
11.11.11.11/32
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host rule 11 match ip dest-
port 80
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host rule 11 match ip
protocol tcp
root@hbn03-host00:~# nv set acl allow_tcp_conn_from_host type ipv4
```

2. Bind this ACL to the host representor of the DPU and the associated VLAN's SVI interface in the inbound direction:

```
root@hbn03-host00:~# nv set interface pf0hpf_sf,vlan101 acl
allow_tcp_conn_from_host inbound
root@hbn03-host00:~# nv config apply
```

3. Configure the egress ACL rule:

```
root@hbn03-host00:~# nv set acl allow_tcp_resp_from_server rule 21 action permit
root@hbn03-host00:~# nv set acl allow_tcp_resp_from_server rule 21 match
conntack established
root@hbn03-host00:~# nv set acl allow_tcp_resp_from_server rule 21 match ip
protocol tcp
root@hbn03-host00:~# nv set acl allow_tcp_resp_from_server type ipv4
root@hbn03-host00:~# nv config apply
```

4. Bind this ACL to the host representor of the DPU and the associated VLAN's SVI interface in the outbound direction:

```
root@hbn03-host00:~# nv set interface pf0hpf_sf,vlan101 acl
allow_tcp_resp_from_server outbound
root@hbn03-host00:~# nv config apply
```

5.6.4.3.2. Flat Files (cl-acltool) Examples for L3 Stateful ACLs

For the example described under section [NVUE Examples for L3 Stateful ACLs](#), the following are the corresponding ACL rules which must be configured under `/etc/cumulus/acl/policy.d/<rule_name.rules>` followed by invoking `cl-acltool -i` to install the rules in DPU hardware.

1. Configure an ingress ACL rule matching with TCP flow details and CONNTRACK state of NEW, ESTABLISHED under `/etc/cumulus/acl/policy.d/stateful_acl.rules` with the ingress interface as the host representor of the DPU and the associated VLAN's SVI followed by invoking `cl-acltool -i`:

```
[iptables]
## ACL allow_tcp_conn_from_host in dir inbound on interface pflvf7_sf ##
-t mangle -A PREROUTING -p tcp -d 11.11.11.11/32 --dport 80 -m conntrack --
ctstate EST,NEW -m connmark ! --mark 9998 -j CONNMARK --set-mark 9999
-t filter -A FORWARD -i pflvf7_sf -p tcp -d 11.11.11.11/32 --dport 80 -m
conntrack --ctstate EST,NEW -m mark --mark 888 -m comment --comment "priority:1"
-j ACCEPT

## ACL allow_tcp_conn_from_host in dir inbound on interface vlan118 ##
-t filter -A FORWARD -i vlan118 -p tcp -d 11.11.11.11/32--dport 80 -m conntrack
--ctstate EST,NEW -m mark --mark 888 -m comment --comment "priority:1" -j ACCEPT
```

Note:

- a). Ingress ACL rules should be configured with mark value of 888 (`-m mark --mark 888`).
- b). A mangle table rule must be configured with CONNMARK action. The CONNMARK values (`-j CONNMARK --set-mark <value>`) for ingress ACL rules are protocol dependent: 9999 for TCP, 9997 for UDP, and 9995 for ICMP.
- c). ACL rule priority is configured using comment string (`-m comment --comment "priority:1"`).

2. Configure an egress ACL rule matching with TCP and CONNTRACK state of ESTABLISHED, RELATED under `/etc/cumulus/acl/policy.d/stateful_acl.rules` file with the egress interface as the host representor of the DPU and the associated VLAN's SVI followed by invoking `cl-acltool -i`:

```
## ACL allow_tcp_resp_from_server in dir outbound on interface pflvf7_sf ##
-t mangle -A PREROUTING -p tcp -s 11.11.11.11/32 --sport 80 -m conntrack --
ctstate EST -j CONNMARK --set-mark 9998
-t filter -A FORWARD -o pflvf7_sf -p tcp -m conntrack --ctstate EST,REL -m mark
--mark 777 -m comment --comment "priority:1" -j ACCEPT

## ACL allow_tcp_resp_from_server in dir outbound on interface vlan118 ##
-t filter -A FORWARD -o vlan118 -p tcp -m conntrack --ctstate EST,REL -m mark --
mark 777 -m comment --comment "priority:1" -j ACCEPT
```

Note:

- a). Egress ACL rules should be configured with mark value of 777 (`-m mark --mark 777`).
- b). A mangle table rule must be configured with CONNMARK action. The CONNMARK values (`-j CONNMARK --set-mark <value>`) for egress ACL rules are protocol dependent: 9998 for TCP, 9996 for UDP, and 9994 for ICMP.

- c). ACL rule priority is configured using comment string (-m comment --comment "priority:1").

5.6.4.3.3. Flat Files (cl-acltool) Examples for L2 Stateful ACLs

For the example described under section [NVUE Examples for L3 Stateful ACLs](#) (HTTP server at IP address 192.168.5.5 accessible over bridged network), the following are the corresponding ACL rules which must be configured under `/etc/cumulus/acl/policy.d/<rule_name.rules>` followed by invoking `cl-acltool -i`.

1. Configure an ingress ACL rule matching with TCP flow details and CONNTRACK state of NEW, ESTABLISHED under `/etc/cumulus/acl/policy.d/stateful_acl.rules` with the ingress interface as the host representor of the DPU and the associated VLAN's SVI followed by invoking `cl-acltool -i`:

```
[iptables]
## ACL allow_tcp_conn_from_host in dir inbound on interface pflvf7_sf ##
-t mangle -A PREROUTING -p tcp -d 192.168.5.5/32 --dport 80 -m conntrack --
ctstate EST,NEW -m connmark ! --mark 9998 -j CONNMARK --set-mark 9999
-t filter -A FORWARD -i pflvf7_sf -p tcp -d 192.168.5.5/32 --dport 80 -m
conntrack --ctstate EST,NEW -m mark --mark 888 -m comment --comment "priority:1"
-j ACCEPT

## ACL allow_tcp_conn_from_host in dir inbound on interface vlan118 ##
-t filter -A FORWARD -i vlan118 -p tcp -d 192.168.5.5/32--dport 80 -m conntrack
--ctstate EST,NEW -m mark --mark 888 -m comment --comment "priority:1" -j ACCEPT

## ACL rule to bind to ingress physical interface
-t filter -A FORWARD -m physdev --physdev-in pflvf7_sf -p tcp -d 192.168.5.5/32
--dport 80 -m conntrack --ctstate EST,NEW -m mark --mark 888 -m comment --
comment "priority:1" -j ACCEPT
```

Note:

- a). Ingress ACL rules should be configured with mark value of 888 (-m mark --mark 888).
- b). A mangle table rule must be configured with CONNMARK action. The CONNMARK values (-j CONNMARK --set-mark <value>) for ingress ACL rules are protocol dependent: 9999 for TCP, 9997 for UDP, and 9995 for ICMP.
- c). An additional rule must be configured with binding to physical interface (-m physdev --physdev-in pflvf7_sf).
- d). ACL rule priority is configured using comment string (-m comment --comment "priority:1").

2. Configure an egress ACL rule matching with TCP and CONNTRACK state of ESTABLISHED, RELATED under `/etc/cumulus/acl/policy.d/stateful_acl.rules` file with the egress interface as the host representor of the DPU and the associated VLAN's SVI followed by invoking `cl-acltool -i`:

```
## ACL allow_tcp_resp_from_server in dir outbound on interface pflvf7_sf ##
-t mangle -A PREROUTING -p tcp -s 192.168.5.5/32 --sport 80 -m conntrack --
ctstate EST -j CONNMARK --set-mark 9998
-t filter -A FORWARD -o pflvf7_sf -p tcp -m conntrack --ctstate EST,REL -m mark
--mark 777 -m comment --comment "priority:1" -j ACCEPT

## ACL allow_tcp_resp_from_server in dir outbound on interface vlan118 ##
-t filter -A FORWARD -o vlan118 -p tcp -m conntrack --ctstate EST,REL -m mark --
mark 777 -m comment --comment "priority:1" -j ACCEPT
```

```
## ACL rule to bind to egress physical interface
-t filter -A FORWARD -m physdev --physdev-out pflvf7_sf -p tcp -m conntrack --
ctstate EST,REL -m mark --mark 777 -m comment --comment "priority:1" -j ACCEPT
```

**Note:**

- a). Egress ACL rules should be configured with mark value of 777 (`-m mark --mark 777`).
- b). A mangle table rule must be configured with CONNMARK action. The CONNMARK values (`-j CONNMARK --set-mark <value>`) for egress ACL rules are protocol dependent: 9998 for TCP, 9996 for UDP, and 9994 for ICMP.
- c). An additional rule must be configured with binding to physical interface (`-m physdev --physdev-out pflvf7_sf`).
- d). ACL rule priority is configured using comment string (`-m comment --comment "priority:1"`).

5.6.4.4. DHCP Relay on HBN

DHCP is a client server protocol that automatically provides IP hosts with IP addresses and other related configuration information. A DHCP relay (agent) is a host that forwards DHCP packets between clients and servers. DHCP relays forward requests and replies between clients and servers that are not on the same physical subnet.

DHCP relay can be configured using either flat file (supervisord configuration) or through NVUE.

5.6.4.4.1. Configuration

HBN is a non-systemd based container. Therefore, the DHCP relay must be configured as explained in the following subsections.

5.6.4.4.1.1. Flat File Configuration (Supervisord)

The HBN initialization script installs default configuration files on the DPU in `/var/lib/hbn/etc/supervisor/conf.d/`. The DPU directory is mounted to `/etc/supervisor/conf.d` which achieves configuration persistence.

By default, DHCP relay is disabled. Default configuration applies to one instance of DHCPv4 relay and DHCPv6 relay.

5.6.4.4.1.2. NVUE Configuration

The user can use NVUE to configure and maintain DHCPv4 and DHCPv6 relays with CLI and REST API. NVUE generates all the required configurations and maintains the relay service.

5.6.4.4.1.3. DHCPv4 Relay Configuration

NVUE Example

The following configuration starts a relay service which listens for the DHCP messages on `p0_sf`, `p1_sf`, and `vlan482` and relays the requests to DHCP server 10.89.0.1 with `giaddress-interface as lo`.

```
nv set service dhcp-relay default giaddress-interface lo
nv set service dhcp-relay default interface p0_sf
nv set service dhcp-relay default interface p1_sf
```

```
nv set service dhcp-relay default interface vlan482
nv set service dhcp-relay default server 10.89.0.1
```

Flat Files Example

```
[program: isc-dhcp-relay-default]
command = /usr/sbin/dhcrelay --nl -d -i p0_sf -i p1_sf -id vlan482 -U lo 10.89.0.1
autostart = true
autorestart = unexpected
startsecs = 3
startretries = 3
exitcodes = 0
stopsignal = TERM
stopwaitsecs = 3
```

Where:

Option	Description
-i	Network interface to listen on for requests and replies
-iu	Upstream network interface
-id	Downstream network interface
-U [address]%%ifname	Gateway IP address interface. Use %% for IP% %ifname. % is used as an escape character.
--loglevel-debug	Debug logging. Location: /var/log/syslog.
-a	Append an agent option field to each request before forwarding it to the server with default values for <code>circuit-id</code> and <code>remote-id</code>
-r remote-id	Set a custom remote ID string (max of 255 chars). To use this option, you must also enable the <code>-a</code> option.
--use-pif-circuit-id	Set the underlying physical interface which receives the packet as the <code>circuit-id</code> . To use this option you must also enable the <code>-a</code> option.

5.6.4.4.1.4. DHCPv4 Relay Option 82

NVUE Example

The following NVUE command is used to enable option 82 insertion in DHCP packets with default values:

```
nv set service dhcp-relay default agent
```

To provide a custom `remote-id` (e.g., `host10`) using NVUE:

```
nv set service dhcp-relay default agent remote-id host10
```

To use the underlying physical interface on which the request is received as `circuit-id` using NVUE:

```
nv set service dhcp-relay default agent use-pif-circuit-id
```

Flat Files Example

```
[program: isc-dhcp-relay-default]
command = /usr/sbin/dhcrelay --nl -d -i p0_sf -i p1_sf -i vlan482 -U lo -a --use-pif-circuit-id -r host10 10.89.0.1
autostart = true
autorestart = unexpected
```

```
startsecs = 3
startretries = 3
exitcodes = 0
stopsignal = TERM
stopwaitsecs = 3
```

5.6.4.4.1.5. DHCPv6 Relay Configuration

NVUE Example

The following NVUE command starts the DHCPv6 Relay service which listens for DHCPv6 requests on `vlan482` and sends relayed DHCPv6 requests towards `p0_sf` and `p1_sf`.

```
nv set service dhcp-relay6 default interface downstream vlan482
nv set service dhcp-relay6 default interface upstream p0_sf
nv set service dhcp-relay6 default interface upstream p1_sf
```

Flat Files Example

```
[program: isc-dhcp-relay6-default]
command = /usr/sbin/dhcrelay --nl -6 -d -l vlan482 -u p0_sf -u p1_sf
autostart = true
autorestart = unexpected
startsecs = 3
startretries = 3
exitcodes = 0
stopsignal = TERM
stopwaitsecs = 3
```

Where:

Option	Description
-l	Downstream interface. Use %% for IP%%ifname. % is used as escape character.
-u	Upstream interface. Use %% for IP%%ifname. % is used as escape character.
-6	IPv6
--loglevel-debug	Debug logging located at /var/log/syslog.

5.6.4.4.2. DHCP Relay and VRF Considerations

DHCP relay can be spawned inside a VRF context to handle the DHCP requests in that VRF. To achieve that, the user can follow these guidelines:

- ▶ DHCPv4 on default VRF:

```
/usr/sbin/dhcrelay --nl -i <interface> -U [address]%%<interface> <server_ip>
```
- ▶ DHCPv4 on VRF:

```
/usr/sbin/ip vrf exec <vrf> /usr/sbin/dhcrelay --nl -i <interface> -U [address]%%<interface> <server_ip>
```
- ▶ DHCPv6 on default VRF:

```
/usr/sbin/dhcrelay --nl -6 -l <interface> -u <interface>
```
- ▶ DHCPv6 on VRF:

```
/usr/sbin/ip vrf exec <vrf> /usr/sbin/dhcrelay --nl -6 -l p0 -u p1
```

Chapter 6. Troubleshooting

6.1. HBN Container Does Not Start

If the container is not starting and is not appearing in `crictl ps` output, check `kubelet@mgmt` logs with the following:

```
journalctl _SYSTEMD_UNIT=kubelet@mgmt.service
```

If the following message appears in the logs, try rebooting the DPU to free up the huge pages resources:

```
"Failed to admit pod, unexpected error while attempting to recover from admission failure" pod="default/doca-app-hbn-hbn-01-00" err="preemption: error finding a set of pods to preempt: no set of running pods found to reclaim resources: [(res: hugepages-2Mi, q: 1073741824), ]"
```

6.2. Generating Support Dump

HBN support dump can be generated using the `cl-support` command:

```
root@bf2:/tmp# cl-support
Please send /var/support/cl_support_bf2-s02-1-ipmi_20221025_180508.txz to Cumulus support
```

The generated dump would be available in `/var/support` in the HBN container and would contain any process core dump as well as log files.

The `/var/support` directory is also mounted on the host DPU at `/var/lib/hbn/var/support`.

6.3. SFC Troubleshooting

To troubleshoot flows going through SFC interfaces, the first step is to disable the `n12doca` service in the HBN container:

```
root@bf2:/tmp# supervisorctl stop n12doca
n12doca: stopped
```

Stopping `n12doca` effectively stops hardware offloading and switches to software forwarding. All packets would appear on `tcpdump` capture on the DPU interfaces.

`tcpdump` can be performed on SF interfaces as well as VLAN, VXLAN, and uplinks to determine where a packet gets dropped or which flow a packet is taking.

6.4. nl2doca Troubleshooting

The `nl2doca` log file is located at `/var/log/hbn/nl2docad.log`.

To check the status of the NVUE daemon, run:

```
supervisorctl status nl2doca
```

If a certain traffic flow does not work as expected, disable `nl2doca`, i.e., disable hardware offloading:

```
supervisorctl stop nl2doca
```

With hardware offloading disabled, you can confirm it is an offloading issue if the traffic starts working.

If it is not an offloading issue, use `tcpdump` on various interfaces to see where the packet gets dropped.

Offloaded entries can be checked in `/cumulus/nl2docad/run/software-tables/15`.

Encapsulation format is as follows:

```
flow-entry : 0xb
  flow-pattern :
    ingress port :pf0hpf_sf
    ingress pd port :13
    priority :3
    eth type: 0x800
    ip dst :10.10.10.3/32
  flow-actions :
    SET SRC MAC:08:c0:eb:c0:59:f1
    SET DST MAC:1c:34:da:19:4a:20
    OUTPUT PD PORT ID idx 0:11(pl_sf)*
    STATS: pkts: 0 bytes: 0
```

To check counters for packets going to the kernel, run:

```
echo 1 > /cumulus/nl2docad/ctrl/debug
cat /cumulus/nl2docad/debug/stats/punt
```

6.5. NVUE Troubleshooting

To check the status of the NVUE daemon, run:

```
supervisorctl status nvued
```

To restart the NVUE daemon, run:

```
supervisorctl restart nvued
```

Chapter 7. Known Issues

The following table lists the known issues and limitations for this release of HBN.

Reference	Description
3452914	Description: IPv6 OOB connectivity from the HBN container stops working if the br-mgmt interface on the DPU goes down. When going down, the br-mgmt interface loses its IPv6 address, which is used as the gateway address for the HBN container. If the br-mgmt interface comes back up, its IPv6 address is not added back and IPv6 OOB connectivity from the HBN container will not work.
	Workaround: <ol style="list-style-type: none">1. Add the following line to <code>/etc/sysctl.d/99-sysctl.conf</code> on the DPU side, outside the HBN container: <pre>net.ipv6.conf.all.keep_addr_on_down = 1</pre>2. Load the updated <code>/etc/sysctl.d/99-sysctl.conf</code>: <pre>sysctl --load=/etc/sysctl.d/99-sysctl.conf</pre>
	Keyword: Statistics; container
	Reported in HBN version: 1.4.0
3339304	Description: Statistics for hardware-offloaded traffic are not reflected on SFs inside an HBN container.
	Workaround: Look up the stats using <code>ip -s link show</code> on PFs outside of the HBN container. PFs would show Tx/Rx stats for traffic that is hardware-accelerated in the HBN container.
	Keyword: Statistics; container
	Reported in HBN version: 1.4.0
3352003	Description: NVUE show, config, and apply commands malfunction if the <code>nvued</code> and <code>nvued-startup</code> services are not in the <code>RUNNING</code> and <code>EXITED</code> states respectively.
	Workaround: N/A
	Keyword: NVUE commands
	Reported in HBN version: 1.3.0
3354029	Description: If interfaces on which BGP unnumbered peering is configured are not defined in the <code>/etc/network/interfaces</code> configuration file, BGP peering does not get established on them.
	Workaround: N/A
	Keyword: BGP
	Reported in HBN version: 1.3.0

Reference	Description
3168683	Description: If many interfaces are participating in EVPN/routing, it is possible for the routing process to run out of memory.
	Workaround: Have a maximum of 8 VF interfaces participating in routing/VXLAN.
	Keyword: Routing; memory
	Reported in HBN version: 1.2.0
3219539	Description: TC rules are programmed by OVS to map uplink and host representor ports to HBN service. These rules are ageable and can result in packets needing to get software forwarded periodically to refresh the rules.
	Workaround: The timeout value can be adjusted by changing the OVS parameter <code>other_config : max-idle</code> as documented here . The shipped default value is 10000ms (10s).
	Keyword: SFC; aging
	Reported in HBN version: 1.2.0
3184745	Description: The command <code>nv show interface <intf> acl</code> does not show correct information if there are multiple ACLs bound to the interface.
	Workaround: Use the command <code>nv show interface <intf></code> to view the ACLs bound to an interface.
	Keyword: ACLs
	Reported in HBN version: 1.2.0
3158934	Description: Deleting an NVUE user by removing their password file and restarting the <code>decrypt-user-add</code> service on the HBN container does not work.
	Workaround: Either respawn the container after deleting the file, or delete the password file corresponding to the user by running <code>userdel -r username</code> .
	Keyword: User deletion
	Reported in HBN version: 1.2.0
3191433	Description: ECMP selection for the underlay path uses the ingress port and identifies uplink ports via round robin. This may not result in uniform spread of the traffic.
	Workaround: N/A
	Keyword: ECMP
	Reported in HBN version: 1.2.0
3185003	Description: When a packet is encapsulated with a VXLAN header, it adds extra bytes which may cause the packet to exceed the MTU of link. Typically, the packet would be fragmented but its silently dropped and no fragmentation happens.
	Workaround: Make sure that the MTU on the uplink port is always 50 bytes more than host ports so that even after adding VXLAN headers, ingress packets do not exceed the MTU.
	Keyword: MTU; VXLAN
	Reported in HBN version: 1.2.0
3184905	Description: On VXLAN encapsulation, the DF flag is not propagated to the outer header. Such a packet may be truncated when forwarded in the kernel, and it may be dropped when hardware offloaded.

Reference	Description
	<p>Workaround: Make sure that the MTU on the uplink port is always 50 bytes more than host ports so that even after adding VXLAN headers, ingress packets do not exceed the MTU.</p> <p>Keyword: VXLAN</p> <p>Reported in HBN version: 1.2.0</p>
3188688	<p>Description: When stopping the container using the command <code>crictl stop</code> an error may be reported because the command uses a timeout of 0 which is not enough to stop all the processes in the HBN container.</p> <p>Workaround: Pass a timeout value when stopping the HBN container by running: <code>crictl stop --timeout 60 <hbn-container></code></p> <p>Keyword: Timeout</p> <p>Reported in HBN version: 1.2.0</p>
3129749	<p>Description: The same ACL rule cannot be applied in both the inbound and outbound direction on a port.</p> <p>Workaround: N/A</p> <p>Keyword: ACLs</p> <p>Reported in HBN version: 1.2.0</p>
3126560	<p>Description: The system's time zone cannot be modified using NVUE in the HBN container.</p> <p>Workaround: The timezone can be manually changed by symlinking the <code>/etc/localtime</code> file to a binary time zone's identifier in the <code>/usr/share/zoneinfo</code> directory. For example: <code>sudo ln -sf /usr/share/zoneinfo/GMT /etc/localtime</code></p> <p>Keyword: Time zone; NVUE</p> <p>Reported in HBN version: 1.2.0</p>
3118204	<p>Description: Auto-BGP functionality (where the ASN does not need to be configured but is dynamically inferred by the system based on the system's role as a leaf or spine device) is not supported on HBN.</p> <p>Workaround: If BGP is configured and used on HBN, the BGP ASN must be manually configured.</p> <p>Keyword: BGP</p> <p>Reported in HBN version: 1.2.0</p>
3233088	<p>Description: Since checksum calculation is offloaded to the hardware (not done by the kernel), it is expected to see an incorrect checksum in the tcpdump for locally generated, outgoing packets. BGP keepalives and updates are some of the packets that show such incorrect checksum in tcpdump.</p> <p>Workaround: N/A</p> <p>Keyword: BGP</p> <p>Reported in HBN version: 1.2.0</p>
3049879	<p>Description: When reloading (<code>ifreload</code>) an empty <code>/etc/network/interfaces</code> file, the previously created interfaces are not deleted.</p>

Reference	Description
	<p>Workaround: To delete all previously created interfaces, at least one interface must be present in <code>/etc/network/interfaces</code>. The following configuration can be used as a safe "empty" file to delete all other virtual devices:</p> <pre>auto p0 iface p0 auto p1 iface p1</pre> <p>Keyword: Configuration file</p> <p>Reported in HBN version: 1.3.0</p>
3017202	<p>Description: Due to disabled backend foundation units, some NVUE commands return <code>500 INTERNAL SERVER ERROR/404 NOT FOUND</code>. These commands are related to features or subsystems which are not supported on HBN.</p> <p>Workaround: N/A</p> <p>Keyword: Unsupported NVUE commands</p> <p>Reported in HBN version: 1.3.0</p>
2821785	<p>Description: MAC addresses are not learned in the hardware but only in software. This may affect performance in pure L2 unicast traffic. This should not affect performance of IPv4/IPv6 traffic or L2 control traffic (i.e., STP, LLDP).</p> <p>Workaround: N/A</p> <p>Keyword: MAC; L2</p> <p>Reported in HBN version: 1.3.0</p>
2828838	<p>Description: NetworkManager and other services not directly related to HBN may display the following message in syslog:</p> <pre>"netlink: read: too many netlink events. Need to resynchronize platform cache"</pre> <p>The message has no functional impact and may be ignored.</p> <p>Workaround: N/A</p> <p>Keyword: Error</p> <p>Reported in HBN version: 1.3.0</p>

Chapter 8. Bug Fixes

The following table lists the known issues and limitations for this release of HBN.

Reference	Description
3191433	Description: ECMP selection for the underlay path uses the ingress port and identifies uplink ports via round robin. This may not result in uniform spread of the traffic. Fixed in HBN version: 1.4.0
3049879	Description: When reloading (<code>ifreload</code>) an empty <code>/etc/network/interfaces</code> file, the previously created interfaces are not deleted.. Fixed in HBN version: 1.4.0
3284607	Description: When an ACL is configured for IPv4 and L4 parameters (protocol tcp/udp, source, and destination ports) match, the ACL also matches IPv6 traffic with the specified L4 parameters. Fixed in HBN version: 1.4.0
3282113	Description: Some DPUs experience an issue with the clock settings after installing a BlueField OS in an HBN setting in which the date reverts back to "Thu Sep 8, 2022". Fixed in HBN version: 1.4.0
3354029	Description: If interfaces on which BGP unnumbered peering is configured are not defined in the <code>/etc/network/interfaces</code> configuration file, BGP peering does not get established on them. Fixed in HBN version: 1.4.0

Notice

This document is provided for information purposes only and shall not be regarded as a warranty of a certain functionality, condition, or quality of a product. NVIDIA Corporation nor any of its direct or indirect subsidiaries and affiliates (collectively: "NVIDIA") make no representations or warranties, expressed or implied, as to the accuracy or completeness of the information contained in this document and assume no responsibility for any errors contained herein. NVIDIA shall have no liability for the consequences or use of such information or for any infringement of patents or other rights of third parties that may result from its use. This document is not a commitment to develop, release, or deliver any Material (defined below), code, or functionality.

NVIDIA reserves the right to make corrections, modifications, enhancements, improvements, and any other changes to this document, at any time without notice.

Customer should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

NVIDIA products are sold subject to the NVIDIA standard terms and conditions of sale supplied at the time of order acknowledgement, unless otherwise agreed in an individual sales agreement signed by authorized representatives of NVIDIA and customer ("Terms of Sale"). NVIDIA hereby expressly objects to applying any customer general terms and conditions with regards to the purchase of the NVIDIA product referenced in this document. No contractual obligations are formed either directly or indirectly by this document.

NVIDIA products are not designed, authorized, or warranted to be suitable for use in medical, military, aircraft, space, or life support equipment, nor in applications where failure or malfunction of the NVIDIA product can reasonably be expected to result in personal injury, death, or property or environmental damage. NVIDIA accepts no liability for inclusion and/or use of NVIDIA products in such equipment or applications and therefore such inclusion and/or use is at customer's own risk.

NVIDIA makes no representation or warranty that products based on this document will be suitable for any specified use. Testing of all parameters of each product is not necessarily performed by NVIDIA. It is customer's sole responsibility to evaluate and determine the applicability of any information contained in this document, ensure the product is suitable and fit for the application planned by customer, and perform the necessary testing for the application in order to avoid a default of the application or the product. Weaknesses in customer's product designs may affect the quality and reliability of the NVIDIA product and may result in additional or different conditions and/or requirements beyond those contained in this document. NVIDIA accepts no liability related to any default, damage, costs, or problem which may be based on or attributable to: (i) the use of the NVIDIA product in any manner that is contrary to this document or (ii) customer product designs.

No license, either expressed or implied, is granted under any NVIDIA patent right, copyright, or other NVIDIA intellectual property right under this document. Information published by NVIDIA regarding third-party products or services does not constitute a license from NVIDIA to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property rights of the third party, or a license from NVIDIA under the patents or other intellectual property rights of NVIDIA.

Reproduction of information in this document is permissible only if approved in advance by NVIDIA in writing, reproduced without alteration and in full compliance with all applicable export laws and regulations, and accompanied by all associated conditions, limitations, and notices.

THIS DOCUMENT AND ALL NVIDIA DESIGN SPECIFICATIONS, REFERENCE BOARDS, FILES, DRAWINGS, DIAGNOSTICS, LISTS, AND OTHER DOCUMENTS (TOGETHER AND SEPARATELY, "MATERIALS") ARE BEING PROVIDED "AS IS." NVIDIA MAKES NO WARRANTIES, EXPRESSED, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE MATERIALS, AND EXPRESSLY DISCLAIMS ALL IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE. TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL NVIDIA BE LIABLE FOR ANY DAMAGES, INCLUDING WITHOUT LIMITATION ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF ANY USE OF THIS DOCUMENT, EVEN IF NVIDIA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Notwithstanding any damages that customer might incur for any reason whatsoever, NVIDIA's aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms of Sale for the product.
