Table 4 Virtual GPUs supporting Linux ................................................................. 25
NVIDIA GRID™ vGPU™ enables multiple virtual machines (VMs) to have simultaneous, direct access to a single physical GPU, using the same NVIDIA graphics drivers that are deployed on non-virtualized Operating Systems. By doing this, GRID vGPU provides VMs with unparalleled graphics performance and application compatibility, together with the cost-effectiveness and scalability brought about by sharing a GPU among multiple workloads.

This chapter introduces the architecture and features of vGPU. Chapter 2 provides a step-by-step guide to getting started with vGPU on Citrix XenServer and VMware ESXi. Chapter 3 describes using vGPU with Linux VMs. Chapters 4 and 5 cover vGPU management and performance optimization on XenServer, and Chapter 6 provides guidance on troubleshooting.

1.1 ARCHITECTURE

GRID vGPU’s high-level architecture is illustrated in Figure 1. Under the control of NVIDIA’s GRID Virtual GPU Manager running under the hypervisor, GRID physical GPUs are capable of supporting multiple virtual GPU devices (vGPUs) that can be assigned directly to guest VMs.

Guest VMs use GRID virtual GPUs in the same manner as a physical GPU that has been passed through by the hypervisor: an NVIDIA driver loaded in the guest VM provides direct access to the GPU for performance-critical fast paths, and a paravirtualized interface to the GRID Virtual GPU Manager is used for non-performant management operations.
GRID vGPUs are analogous to conventional GPUs, having a fixed amount of GPU framebuffer, and one or more virtual display outputs or “heads”. The vGPU’s framebuffer is allocated out of the physical GPU’s framebuffer at the time the vGPU is created, and the vGPU retains exclusive use of that framebuffer until it is destroyed.

All vGPUs resident on a physical GPU share access to the GPU’s engines including the graphics (3D), video decode, and video encode engines.
1.2 SUPPORTED GPUs

GRID vGPU is supported on NVIDIA GRID K1, K2, and is available as a licensed feature on Tesla M60, M6. Refer to the release notes for a list of recommended server platforms to use with GRID GPUs.

1.2.1 Virtual GPU types

GRID K1, K2, and Tesla M60 each implement multiple physical GPUs; K2 and M60 have 2 GPUs onboard; GRID K1 has 4 GPUs. Tesla M60 implements a single physical GPU.

Each physical GPU can support several different types of virtual GPU. Virtual GPU types have a fixed amount of framebuffer, number of supported display heads and maximum resolutions, and are targeted at different classes of workload.

The virtual GPU types supported by GRID GPUs are defined in Table 1 and Table 2.

Due to their differing resource requirements, the maximum number of vGPUs that can be created simultaneously on a physical GPU varies according to the vGPU type. For example, a GRID K2 physical GPU can support up to 4 K240Q vGPUs on each of its two physical GPUs, for a total of 8 vGPUs, but only 2 K260Qs vGPUs, for a total of 4 vGPUs.

**Note:** GRID vGPU is a licensed feature on Tesla M6/M60. A software license is required to enable full vGPU features within the guest VM. For more details, see sections 2.3, 3.2, and the GRID Licensing User Guide.

### 1.2.2 Homogeneous virtual GPUs

This release of GRID vGPU supports homogeneous virtual GPUs: at any given time, the virtual GPUs resident on a single physical GPU must be all of the same type. However, this restriction doesn’t extend across physical GPUs on the same card. Each physical GPU on a K1 or K2 may host different types of virtual GPU at the same time.
For example, a GRID K2 card has two physical GPUs, and can support five types of virtual GPU; GRID K200, K220Q, K240Q, K260Q, and K280Q. Figure 3 shows some example virtual GPU configurations on K2:

<table>
<thead>
<tr>
<th>GRID K2</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Physical GPU 0</th>
<th>Physical GPU 1</th>
</tr>
</thead>
</table>

Valid configuration with K240Q vGPUs on GPU 0, K260Q vGPUs on GPU 1:

```
K240Q | K240Q | K240Q | K240Q | K260Q | K260Q
```

Valid configuration with K200 vGPUs on GPU 0, K240Q vGPUs on GPU 1:

```
K200 | K200 | K200 | K200 | K240Q | K200 | K200 | K200 | K240Q | K240Q | K240Q | K240Q
```

Invalid configuration with mixed vGPU types on GPU 0:

```
K240Q | K240Q | K260Q | K200 | K200 | K200 | K200 | K200
```

Figure 3 Example vGPU configurations on GRID K2
1.3 GUEST OS SUPPORT

This release of GRID vGPU includes support for the following guest VM operating systems. Refer to the driver release notes for further information on supported configurations:

1.3.1 Windows

- Windows 7 (32/64-bit)
- Windows 8 (32/64-bit), Windows 8.1 (32/64-bit)
- Windows 10 (32/64-bit) – preview / pre-production drivers
- Windows Server 2008 R2
- Windows Server 2012 R2

1.3.2 Linux

64-bit Linux guest VMs are supported on the following virtual GPU types:

<table>
<thead>
<tr>
<th>Tesla M60</th>
<th>M60-8Q</th>
<th>M60-4Q</th>
<th>M60-2Q</th>
<th>M60-1Q</th>
<th>M60-0Q</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tesla M6</td>
<td>M6-8Q</td>
<td>M6-4Q</td>
<td>M6-2Q</td>
<td>M6-1Q</td>
<td>M6-0Q</td>
</tr>
</tbody>
</table>

Table 3 Virtual GPUs supporting Linux

1.4 FEATURES

This release of GRID vGPU includes support for:

- DirectX 9/10/11, Direct2D, and DirectX Video Acceleration (DXVA)
- OpenGL 4.5.
- NVIDIA GRID SDK (remote graphics acceleration).

CUDA and OpenCL are supported on these virtual GPUs:

- GRID M60-8Q, M6-8Q
This chapter provides a step-by-step guide to booting a Windows VM on Citrix XenServer and VMware vSphere with NVIDIA Virtual GPU.

### 2.1 CITRIX XENSERVER

These setup steps assume familiarity with the XenServer skills covered in Appendix A

#### 2.1.1 Prerequisites

Before proceeding, ensure that you have these prerequisites:

- NVIDIA GRID K1,K2, or Tesla M6, M60 cards.
- A server platform capable of hosting XenServer and the NVIDIA GRID or Tesla cards. Refer to the release notes for a list of recommended servers.
- The NVIDIA GRID vGPU software package for Citrix XenServer, consisting of the GRID Virtual GPU Manager for XenServer, and NVIDIA GRID vGPU drivers for Windows, 32- and 64-bit.
- Citrix XenServer 6.2 SP1 with applicable hotfixes, or later, obtainable from Citrix.
- An installed Windows VM to be enabled with vGPU.

To run Citrix XenDesktop with virtual machines running NVIDIA Virtual GPU, you will also need:

- Citrix XenDesktop 7.1 or later, obtainable from Citrix.

**Note:** Earlier versions of Citrix XenServer and XenDesktop are not supported for use with NVIDIA Virtual GPU.
Review the release notes and known issues for GRID Virtual GPU before proceeding with installation.

2.1.2 Installing Citrix XenServer and XenCenter

Install Citrix XenServer and any applicable patches, following Citrix’s installation instructions. Install the Citrix XenCenter management GUI on a PC.

2.1.3 Installing the NVIDIA Virtual GPU Manager for XenServer

The NVIDIA Virtual GPU Manager runs in XenServer’s dom0. It is provided as a RPM file for XenServer 6.2 SP1 and as a Supplemental Pack for XenServer 6.5 SP1.

**Note:** there are separate Virtual GPU Manager files for different versions of XenServer. Consult the release notes for guidance on which package to use for each version of XenServer.

2.1.3.1 RPM package installation

The RPM file must be copied to XenServer’s dom0 prior to installation (see A.2, Copying files to dom0). Use the `rpm` command to install the package:

```
[root@xenserver ~]# rpm -iv NVIDIA-vgx-xenserver-6.2-340.57.i386.rpm
Preparing packages for installation...
NVIDIA-vgx-xenserver-6.2-340.57
[root@xenserver ~]#
```

Reboot the XenServer platform:

```
[root@xenserver ~]# shutdown -r now
Broadcast message from root (pts/1) (Fri Dec 6 14:24:11 2013):
The system is going down for reboot NOW!
[root@xenserver ~]#
```

2.1.3.2 Update RPM package

If an existing GRID Virtual GPU Manager is already installed on the system and you wish to upgrade, follow these steps:

- Shut down any VMs that are using GRID vGPU.
- Install the new package using the \(-U\) option to the \(\text{rpm}\) command, to upgrade from the previously installed package:

```bash
[root@xenserver ~]# rpm -Uv NVIDIA-vgx-xenserver-6.2-340.57.i386.rpm
Preparing packages for installation...
NVIDIA-vgx-xenserver-6.2-340.57
[root@xenserver ~]#
```

**Note:** You can query the version of the current GRID package using the \(\text{rpm} \ –q\) command:

```bash
[root@xenserver ~]# rpm -q NVIDIA-vgx-xenserver
NVIDIA-vgx-xenserver-6.2-340.57
[root@xenserver ~]#
```

If an existing NVIDIA GRID package is already installed and you don’t select the upgrade \((-U)\) option when installing a newer GRID package, the \(\text{rpm}\) command will return many conflict errors.

Preparing packages for installation...

```bash
file /usr/bin/nvidia-smi from install of NVIDIA-vgx-xenserver-6.2-340.57.i386 conflicts with file from package NVIDIA-vgx-xenserver-6.2-331.59.i386
file /usr/lib/libnvidia-ml.so from install of NVIDIA-vgx-xenserver-6.2-340.57.i386 conflicts with file from package NVIDIA-vgx-xenserver-6.2-331.59.i386
...
```

Reboot the XenServer platform:

```bash
[root@xenserver ~]# shutdown \(-r\) now
```

Broadcast message from root (pts/1) (Fri Dec 6 14:24:11 2013):

```
The system is going down for reboot NOW!
[root@xenserver ~]#
```

**Note:** GRID Virtual GPU Manager and Guest VM drivers must be matched from the same release. After updating vGPU Manager, guest VMs will boot with vGPU disabled until their guest vGPU driver is updated to match the vGPU Manager version. Consult the release notes for further details.
2.1.3.3 Supplemental Pack installation / update

XenCenter can be used to install / update Supplemental Packs on XenServer hosts. The NVIDIA GRID Virtual GPU Manager supplemental pack is provided as an ISO.

**Note:** NVIDIA GRID Virtual GPU Manager supplemental pack installation / update is supported from XenServer 6.5 SP1 and XenCenter version 6.5 (build 6.5.2.2477) onwards.

- Select **Install Update...** from the **Tools** menu
- Click **Next** after going through the instructions on the **Before You Start** section
- Click **Add** on the **Select Update** section and open NVIDIA’s XenServer Supplemental Pack ISO

![Image of XenCenter interface with selected Supplemental Pack](image)

**Figure 4 GRID vGPU Manager supplemental pack selected in XenCenter**

- Click **Next** on the **Select Update** section
- In the **Select Servers** section select all the XenServer hosts on which the Supplemental Pack should be installed on and click **Next**
- Click **Next** on the **Upload** section once the Supplemental Pack has been uploaded to all the XenServer hosts
Click Next on the Prechecks section
Click Install Update on the Update Mode section
Click Finish on the Install Update section

Figure 5 Successful installation of GRID vGPU Manager supplemental pack

2.1.3.4 Verifying installation

After the XenServer platform has rebooted, verify that the GRID package installed and loaded correctly by checking for the NVIDIA kernel driver in the list of kernel loaded modules.

```
[root@xenserver ~]# lsmod | grep nvidia
nvidia         9522927  0
i2c_core      20294  2 nvidia,i2c_i801
[root@xenserver ~]#
```

Verify that the NVIDIA kernel driver can successfully communicate with the GRID physical GPUs in your system by running the nvidia-smi command, which should produce a listing of the GPUs in your platform:

```
[root@xenserver ~]# nvidia-smi
```
2.1.4 Configuring a VM with Virtual GPU

XenServer supports configuration and management of virtual GPUs using XenCenter, or the `xe` command line tool run in a XenServer dom0 shell. Basic configuration using XenCenter is described in the following sections. Command line management using `xe` is described in Chapter 6.

To configure a VM to use virtual GPU, first ensure the VM is powered off, then right-click on the VM in XenCenter, select “Properties” to open the VM’s properties, and

---

The `nvidia-smi` command is described in more detail in section 4.1.

If `nvidia-smi` fails to run or doesn’t produce the expected output for all the NVIDIA GPUs in your system, see Chapter 6 for troubleshooting steps.
select the “GPU” property. The available GPU types are listed in the GPU type dropdown:

![Image of XenCenter configuring a VM with a vGPU]

**Figure 6 Using XenCenter to configure a VM with a vGPU**

### 2.1.5 Booting the VM and Installing Drivers

Once you have configured a VM with a vGPU, start the VM, either from XenCenter or by using `xe vm-start` in a dom0 shell.

Viewing the VM’s console in XenCenter, the VM should boot to a standard Windows desktop in VGA mode at 800x600 resolution. The Windows screen resolution control panel may be used to increase the resolution to other standard resolutions, but to fully enable vGPU operation, as for a physical NVIDIA GPU, the NVIDIA driver must be installed.

- Copy the 32- or 64-bit NVIDIA Windows driver package to the guest VM and execute it to unpack and run the driver installer:
Getting Started

Figure 7 NVIDIA driver installation in the guest VM

- Click through the license agreement
- Select Express Installation
- Once driver installation completes, the installer may prompt you to restart the platform. Select Restart Now to reboot the VM, or exit the installer and reboot the VM when ready.

Once the VM restarts, it will boot to a Windows desktop. Verify that the NVIDIA driver is running by right-clicking on the desktop. The NVIDIA Control Panel will be listed in the menu; select it to open the control panel. Selecting “System Information” in the NVIDIA control panel will report the Virtual GPU that the VM is using, its capabilities, and the NVIDIA driver version that is loaded.
This completes the process of setting up a single VM to use GRID vGPU. The VM is now capable of running the full range of DirectX and OpenGL graphics applications.

2.1.6 Applying a vGPU license

GRID vGPU is a licensed feature on Tesla M6, M60. When booted on these GPUs, a vGPU runs at reduced capability until a license is acquired. See section 2.3 for details on how to configure licensing on Windows.

2.1.7 Removing a VM’s vGPU configuration

To remove a virtual GPU assignment from a VM, such that it no longer uses a virtual GPU, set the GPU type to ‘None’ in the VM’s GPU Properties, as shown in Figure 9.

Alternatively, use vgpu-destroy to delete the virtual GPU object associated with the VM. To discover the vGPU object UUID associated with a given VM, use vgpu-list:

```
[root@xenserver ~]# xe vgpu-list vm-uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2
uuid ( RO) : c1c7c43d-4c99-af76-5051-119f1c2b4188
vm-uuid ( RO): e71afda4-53f4-3a1b-6c92-a364a7f619c2
```
Note: the VM must be in the powered-off state in order for its vGPU configuration to be modified or removed.

Figure 9 Using XenCenter to remove a vGPU configuration from a VM
2.2 VMWARE VSPHERE

2.2.1 Prerequisites

Before proceeding, ensure that you have these prerequisites:

- NVIDIA GRID K1, K2, or Tesla M60, M6 cards.
- A server platform capable of hosting VMware vSphere Hypervisor (ESXi) and the NVIDIA GRID or Tesla cards. Refer to the release notes for a list of recommended servers.
- The NVIDIA GRID vGPU software package for VMware vSphere, consisting of the GRID Virtual GPU Manager for ESXi, and NVIDIA GRID vGPU drivers for Windows, 32- and 64-bit.
- VMware vSphere 2015 or later, obtainable from VMware.
- An installed Windows VM to be enabled with vGPU.

To run VMware Horizon with virtual machines running NVIDIA Virtual GPU, you will also need:

- VMware Horizon 6.1 or later, obtainable from VMware.

Note: Earlier versions of VMware vSphere and Horizon are not supported for use with NVIDIA Virtual GPU.

Review the release notes and known issues for GRID Virtual GPU before proceeding with installation.

2.2.2 Installing VMware vSphere

Install VMware vSphere Hypervisor (ESXi), following VMware’s installation instructions. Install VMware vCenter Server, following VMware’s installation instructions.

2.2.3 Installing the NVIDIA Virtual GPU Manager for vSphere

The NVIDIA Virtual GPU Manager runs on ESXi host. It is provided as a VIB file, which must be copied to the ESXi host and then installed.

2.2.3.1 Package installation

To install the vGPU Manager VIB you need to access the ESXi host via the ESXi Shell or SSH. Refer to VMware’s documentation on how to enable ESXi Shell or SSH for an ESXi host.
**Getting Started**

**Note:** Before proceeding with the vGPU Manager installation make sure that all VM's are powered off and the ESXi host is placed in maintenance mode. Refer to VMware’s documentation on how to place an ESXi host in maintenance mode.

Use the `esxcli` command to install the vGPU Manager package:

```
[root@esxi:~] esxcli software vib install -v /NVIDIA-vgx-
VMware_ESXi_6.0_Host_Driver_346.42-10EM.600.0.0.2159203.vib
```

Installation Result

- **Message:** Operation finished successfully.
- **Reboot Required:** false
- **VIBs Installed:** NVIDIA_bootbank_NVIDIA-vgx-
VMware_ESXi_6.0_Host_Driver_346.42-10EM.600.0.0.2159203
- **VIBs Removed:**
- **VIBs Skipped:**

Reboot the ESXi host and remove it from maintenance mode.

**Note:** GRID Virtual GPU Manager and Guest VM drivers must be matched from the same release. After updating vGPU Manager, guest VMs will boot with vGPU disabled until their guest vGPU driver is updated to match the vGPU Manager version. Consult the release notes for further details.

### 2.2.3.2 Verifying installation

After the ESXi host has rebooted, verify that the GRID package installed and loaded correctly by checking for the NVIDIA kernel driver in the list of kernel loaded modules.

```
[root@esxi:~] vmkload_mod -l | grep nvidia
nvidia                   5    8420
```

If the `nvidia` driver is not listed in the output, check `dmesg` for any load-time errors reported by the driver.

Verify that the NVIDIA kernel driver can successfully communicate with the GRID physical GPUs in your system by running the `nvidia-smi` command, which should produce a listing of the GPUs in your platform:

```
[root@esxi:~] nvidia-smi
Tue Mar 10 17:56:22 2015
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 346.42  Driver Version: 346.42          | |
|-----------------------------------------------------------------------------+
| GPU  Name        Persistence-M| Bus-Id | Disp.A | VoltAble Uncorr. ECC | MemRy-Usage | GPU-Util | Compute M. | |
| Fan | Temp | Perf | Pwr:Usage/Cap| Memory-Usage | GPU-Util | Compute M. | |
```
The `nvidia-smi` command is described in more detail in section 4.1.

If `nvidia-smi` fails to report the expected output for all the NVIDIA GPUs in your system, see Chapter 7 for troubleshooting steps.

### 2.2.4 Configuring a VM with Virtual GPU

**Note:** VMware vSphere does not support VM console in vSphere Web Client for VMs configured with vGPU. Make sure that you have installed an alternate means of accessing the VM (such as VMware Horizon or a VNC server) before you configure vGPU.

VM console in vSphere Web Client will become active again once the vGPU parameters are removed from the VM’s configuration.

To configure vGPU for a VM:
► Select Edit Settings after right-clicking on the VM in the vCenter Web UI
► Select the Virtual Hardware tab
► In the New device selection, select Shared PCI Device and hit Add

This should auto-populate NVIDIA GRID vGPU in the PCI device field, as shown in Figure 10. In the GPU Profile dropdown menu, select the type of vGPU you wish to configure.

![Virtual Hardware settings](image)

Figure 10 VM settings for vGPU

VMs running vGPU should have all their memory reserved:

► Select Edit virtual machine settings from vCenter Web UI
► Expand Memory section and click Reserve all guest memory (All locked)
2.2.5 Booting the VM and Installing Drivers

Once you have configured a VM with a vGPU, start the VM. VM console in vSphere Web Client is not supported in this vGPU release; use VMware Horizon or VNC to access the VM’s desktop.

The VM should boot to a standard Windows desktop in VGA mode at 800x600 resolution. The Windows screen resolution control panel may be used to increase the resolution to other standard resolutions, but to fully enable vGPU operation, as for a physical NVIDIA GPU, the NVIDIA driver must be installed.

- Copy the 32- or 64-bit NVIDIA Windows driver package to the guest VM and execute it to unpack and run the driver installer.
- Click through the license agreement
- Select Express Installation
- Once driver installation completes, the installer may prompt you to restart the platform. Select Restart Now to reboot the VM, or exit the installer and reboot the VM when ready.

Once the VM restarts, it will boot to a Windows desktop. Verify that the NVIDIA driver is running by right-clicking on the desktop. The NVIDIA Control Panel will be listed in the menu; select it to open the control panel. Selecting “System Information” in the NVIDIA control panel will report the Virtual GPU that the VM is using, its capabilities, and the NVIDIA driver version that is loaded.

![Figure 11 Verifying NVIDIA driver operation using NVIDIA Control Panel](image-url)
This completes the process of setting up a single VM to use GRID vGPU. The VM is now capable of running the full range of DirectX and OpenGL graphics applications.

2.2.6 Applying a vGPU license

GRID vGPU is a licensed feature on Tesla M6, M60. When booted on these GPUs, a vGPU runs at reduced capability until a license is acquired. See section 2.3 for details on how to configure licensing on Windows.

2.2.7 Removing a VM’s vGPU configuration

To remove a vGPU configuration from a VM:

- Select Edit settings after right-clicking on the VM in the vCenter Web UI
- Select the Virtual Hardware tab
- Mouse over the PCI Device entry showing NVIDIA GRID vGPU and click on the (X) icon to mark the device for removal.
- Click OK to remove the device and update the VM settings.

2.2.8 Modifying GPU assignment for vGPU-Enabled VMs

VMware vSphere Hypervisor (ESXi) by default uses a breadth-first allocation scheme for vGPU-enabled VMs; allocating new vGPU-enabled VMs on an available, least loaded physical GPU. This policy generally leads to higher performance because it attempts to minimize sharing of physical GPUs, but in doing so it may artificially limit the total number of vGPUs that can run.

ESXi also provides a depth-first allocation scheme for vGPU-enabled VMs. The depth-first allocation policy attempts to maximize the number of vGPUs running on each physical GPU, by placing newly-created vGPUs on the physical GPU that can support the new vGPU and that has the most number of vGPUs already resident. This policy generally leads to higher density of vGPUs, particularly when different types of vGPUs are being run, but may result in lower performance because it attempts to maximize sharing of physical GPUs.

To switch to depth-first allocation scheme add the following parameter to /etc/vmware/config:

```
vGPU.consolidation = true
```
2.3 VGPU LICENSING ON WINDOWS

GRID vGPU is a licensed feature on Tesla M6, M60. When booted on these GPUs, a vGPU runs at reduced capability until a license is acquired:

- Screen resolution is limited to no higher than 1280x1024.
- Frame rate is capped at 3 frames per second.
- GPU resource allocations are limited, which will prevent some applications from running correctly.

These restrictions are removed once a license is acquired.

Full information on configuring and using GRID licensed features, including vGPU, is given in the GRID Licensing User Guide. Basic configuration information is given here:

To configure licensing, open NVIDIA Control Panel and select Manage License task in the Licensing section of the navigation pane. Enter the address of your local GRID License Server in the License Server field. The address can be a fully-qualified domain name such as gridlicense.mycompany.com, or an IP address such as 10.31.20.45.

The Port Number field can be left unset and will default to 7070, which is the default port number used by NVIDIA GRID License Server.

Select Apply to assign the settings. The system will request the appropriate license for the current vGPU from the configured license server and, if successful, vGPU’s full capabilities are enabled (see Figure 12). If the system fails to obtain a license, refer to the GRID Licensing User Guide for guidance on troubleshooting.
Figure 12 Configuring vGPU licensing on Windows
Chapter 3. USING VGPU ON LINUX

Tesla M6/M60 GPUs support vGPU on Linux VMs. 64-bit Linux guest VMs are supported on the following virtual GPU types:

<table>
<thead>
<tr>
<th>Tesla M60</th>
<th>Tesla M6</th>
</tr>
</thead>
<tbody>
<tr>
<td>M60-8Q</td>
<td>M6-8Q</td>
</tr>
<tr>
<td>M60-4Q</td>
<td>M6-4Q</td>
</tr>
<tr>
<td>M60-2Q</td>
<td>M6-2Q</td>
</tr>
<tr>
<td>M60-1Q</td>
<td>M6-1Q</td>
</tr>
<tr>
<td>M60-0Q</td>
<td>M6-0Q</td>
</tr>
</tbody>
</table>

Table 4 Virtual GPUs supporting Linux

Note: Refer to the driver release notes for further information on supported hypervisor and Linux VM configurations.

3.1 INSTALLING VGPU DRIVERS

After creating and booting a Linux VM on the hypervisor, the steps to install NVIDIA Linux vGPU drivers are largely the same as those for installing NVIDIA GPU drivers on a VM running passthrough GPU, or on baremetal Linux.

3.1.1 Prerequisites

Installation of the NVIDIA Linux driver requires:
Using vGPU on Linux

- Compiler toolchain
- Kernel headers

### 3.1.2 Running the driver installer

- Copy the NVIDIA GRID Linux driver package, for example, `NVIDIA-Linux_x86_64-352.47-grid.run`, to the Linux VM.
- Before the driver installer can be run, you must exit the X server and terminate all OpenGL applications. On Red Hat Enterprise Linux / CentOS systems, this can typically be achieved by transitioning to runlevel 3:

  ```bash
  [nvidia@localhost ~]$ sudo init 3
  
  On Ubuntu platforms, use CTRL-ALT-F1 to switch to a console login prompt. Log in and shut down the display manager:
  
  ```bash
  [nvidia@localhost ~]$ sudo service lightdm stop
  ```

- From a console shell, run the driver installer as the root user. The installer should launch and display the driver license agreement (Figure 13):

  ```bash
  sudo sh ./ NVIDIA-Linux_x86_64-352.47-grid.run
  ```

![Figure 13 NVIDIA Linux driver installer](image)

**Figure 13 NVIDIA Linux driver installer**
Accept the license agreement to continue with the driver installation. In some instances the installer may fail to detect the installed kernel headers / sources, in which case the installer should be re-run with the kernel source path specified using the `--kernel-source-path` option:

```bash
sudo sh ./ NVIDIA-Linux_x86_64-352.47-grid.run \
   -kernel-source-path=/usr/src/kernels/3.10.0-229.11.1.el7.x86_64
```

When prompted, accept the option to update the X configuration file (xorg.conf) settings (Figure 14):

![Figure 14 Update xorg.conf settings](image)

Once installation has completed, select OK to exit the installer.

Reboot the system, log in, and run `nvidia-settings` to verify that the NVIDIA is operational with vGPU (Figure 15):

```
[nvidia@localhost ~]$ nvidia-settings
```
GRID vGPU is a licensed feature on Tesla M6, M60. When booted on these GPUs, a vGPU runs at reduced capability until a license is acquired:

- Screen resolution is limited to no higher than 1280x1024.
- Frame rate is capped at 3 frames per second.
- GPU resource allocations are limited, which will prevent some applications from running correctly.

These restrictions are removed once a license is acquired.

Full information on configuring and using GRID licensed features, including vGPU, is given in the GRID Licensing User Guide. Basic configuration information is given here:

To license GRID vGPU, edit `/etc/nvidia/gridd.conf`:

```
[nvidia@localhost ~]$ sudo vi /etc/nvidia/gridd.conf
```

Set `ServerURL` to the address and port number of your local NVIDIA GRID License Server. The address can be a fully-qualified domain name such as `gridlicense.mycompany.com`, or an IP address such as `10.31.20.45`. The port number is appended to the address with a colon, for example `:7070`.  

---

**Figure 15 Verifying operation with nvidia-settings**

**3.2 VGPU LICENSING ON LINUX**
Set FeatureType to 1, to license vGPU:

```bash
# /etc/nvidia/gridd.conf - Configuration file for NVIDIA Grid Daemon

# Description: Set License Server URL
# Data type: string
# Format: "<address>:<port>"
ServerUrl=hqdvls01.nvidia.com:7070

# Description: Set Feature to be enabled
# Data type: integer
# Possible values:
# 1 => for GRID vGPU
# 2 => for GRID Virtual Workstation
FeatureType=1

# Description: Parameter to enable or disable Grid Licensing tab in nvidia-settings
# Data type: boolean
# Possible values: TRUE or FALSE, default is TRUE
EnableUI=TRUE
```

Figure 16 Sample gridd.conf for GRID vGPU

Restart the nvidia-gridd service:

```bash
[nvidia@localhost ~]$ sudo service nvidia-gridd restart
```

The service should automatically obtain a license. This can be confirmed with log messages written to /var/log/messages, and the vGPU within the VM should now exhibit full framerate, resolution, and display output capabilities:

```bash
[nvidia@localhost ~]$ sudo grep gridd /var/log/messages
...
Sep 13 15:40:06 localhost nvidia-gridd: Started (10430)
Sep 13 15:40:24 localhost nvidia-gridd: License acquired successfully.
```

Once configured in gridd.conf, licensing settings persist across reboots and need only be modified if the license server address changes, or the VM is switched to running GPU passthrough.

If the system fails to obtain a license, refer to the GRID Licensing User Guide for guidance on troubleshooting.
Physical GPU performance monitoring can be done using the `nvidia-smi` command line utility and, on Citrix XenServer platforms, using Citrix XenCenter.

**Note:** It is not currently possible to monitor the performance of GPUs being used for GPU passthrough.

### 4.1 USING NVIDIA-SMI

NVIDIA System Management Interface, `nvidia-smi`, is a command line tool that reports management information for NVIDIA physical GPUs present in the system. `nvidia-smi` is run from the XenServer dom0 or ESXi host shells and, when invoked without additional arguments, it provides a summary of all GPUs in the system, along with PCI bus IDs, power state, temperature, current memory usage, and so on.

**Note:** `nvidia-smi` will not list any GPU currently allocated for GPU passthrough.

In this release of GRID vGPU, `nvidia-smi` provides basic reporting of vGPU instances running on physical GPUs; each vGPU instance is reported in the “Compute processes” section, together with its physical GPU index and the amount of framebuffer memory assigned to it. In the example that follows, five vGPUs are running; one on physical GPU 0, and four on physical GPU 1:
For a list of commands supported by `nvidia-smi`, run `nvidia-smi -h`. Note that not all commands apply to GRID supported GPUs.
4.2 USING CITRIX XENCENTER

To monitor GPU performance in XenCenter, click on a server’s Performance Tab, then right-click on the graph window, select Actions, then select New Graph. Provide a name for the graph, and in the list of available counter resources, select one or more GPU counters. Counters are listed for each physical GPU not currently being used for GPU passthrough.

![Using XenCenter to monitor GPU performance](image)

Figure 17 Using XenCenter to monitor GPU performance
Chapter 5. XENSERVER VGPU MANAGEMENT

This chapter describes Citrix XenServer advanced vGPU management techniques using XenCenter and `xe` command line operations.

5.1 MANAGEMENT OBJECTS FOR GPUS

XenServer uses four underlying management objects for GPUs: physical GPUs, GPU groups, vGPU types, and vGPUs. These objects are used directly when managing vGPU via `xe`, and indirectly when managing vGPU via XenCenter.

5.1.1 pgpu

A `pgpu` object represents a physical GPU, such as one of the multiple GPUs present on a GRID K1 or K2 card. XenServer automatically creates `pgpu` objects at startup to represent each physical GPU present on the platform.

To list the physical GPU objects present on a platform, use `xe pgpu-list`. For example, this platform contains a single GRID K2 card with two physical GPUs:

```
[root@xenserver ~]# xe pgpu-list
uuid (RO)            : 7c1e3cfff-1429-0544-df3d-bf8a086fb70a
    vendor-name (RO): NVIDIA Corporation
    device-name (RO): GK104GL [GRID K2]
    gpu-group-uuid (RW): be825ba2-01d7-8d51-9780-f82cfaa64924

uuid (RO)            : d07fa627-7dc9-f625-92be-ce5d2655e830
    vendor-name (RO): NVIDIA Corporation
    device-name (RO): GK104GL [GRID K2]
    gpu-group-uuid (RW): be825ba2-01d7-8d51-9780-f82cfaa64924
```
To see detailed information about a pgpu, use `xe pgpu-param-list`:

```bash
[root@xenserver ~]# xe pgpu-param-list uuid=d07fa627-7dc9-f625-92be-ce5d2655e830

  uuid (RO) : d07fa627-7dc9-f625-92be-ce5d2655e830
  vendor-name (RO) : NVIDIA Corporation
  device-name (RO) : GK104GL [GRID K2]
  gpgpu-group-uuid (RW) : 315a1e1e-6d0c-1cb3-7903-1602d236a33a
  gpgpu-group-name-label (RO) : Group of NVIDIA Corporation GK104GL [GRID K2]

GPUs
  host-uuid (RO) : 2305cc32-c2d8-4fbd-b1aa-d0b0121ba454
  host-name-label (RO) : acurrid-vgpu-2 (VM IPs 10.31.223.0 - 10.31.223.19)
  pci-id (RO) : 0000:0a:00.0
  dependencies (SRO):
  other-config (MRW):
    supported-VGPU-types (RO) : c18ab767-ba72-b286-9350-d8010bab4f30; 7cd190db-e4fe-e824-cf4a-ff1604882323; 24a7baa3-a70a-8c7b-ee7d-f437e8857eca; bfefb8cd-c01b-2691-272c-8e908937922d; 0d581f02-c601-a9b1-f440-f852f31f583e; 2c210411-7de3-37f5-c58c-9635b40d50f6
    enabled-VGPU-types (SRW) : c18ab767-ba72-b286-9350-d8010bab4f30; 7cd190db-e4fe-e824-cf4a-ff1604882323; 24a7baa3-a70a-8c7b-ee7d-f437e8857eca; bfefb8cd-c01b-2691-272c-8e908937922d; 0d581f02-c601-a9b1-f440-f852f31f583e; 2c210411-7de3-37f5-c58c-9635b40d50f6
    resident-VGPUs (RO) :

[root@xenserver ~]#
```

To view physical GPUs in XenCenter, click on the server's GPU tab:
A `vgpu-type` represents a type of virtual GPU, such as GRID K100, K140Q, K200, etc. An additional, `passthrough` vGPU type is defined to represent a physical GPU that is directly assignable to a single guest VM.

XenServer automatically creates `vgpu-type` objects at startup to represent each virtual type supported by the physical GPUs present on the platform.

To list the `vgpu-type` objects present on a platform, use `xe vgpu-type-list`. For example, this platform contains multiple GRID K2 cards, therefore the vGPU types reported are solely those supported by GRID K2:

```
[root@xenserver ~]# xe vgpu-type-list
uuid (RO) : 7cd190db-e4fe-e824-cf4a-ff1604882323
  vendor-name (RO) : NVIDIA Corporation
  model-name (RO) : GRID K240Q
  max-heads (RO) : 2
  max-resolution (RO) : 2560x1600

uuid (RO) : 2c210411-7de3-37f5-c58c-9635b40d50f6
  vendor-name (RO) : NVIDIA Corporation
  model-name (RO) : GRID K220Q
  max-heads (RO) : 2
```
To see detailed information about a vgpu-type, use `xe vgpu-type-param-list`:

To see detailed information about a vgpu-type, use `xe vgpu-type-param-list uuid=7cd190db-e4fe-e824-cf4a-ff1604882323`
5.1.3  gpu-group

A gpu-group is a collection of physical GPUs, all of the same type. XenServer automatically creates gpu-group objects at startup to represent the distinct types of physical GPU present on the platform.

To list the gpu-group objects present on a platform, use xe gpu-group-list. For example, a system with a single GRID K2 card contains a single GPU group of type GRID K2:

```
[root@xenserver ~]# xe gpu-group-list
uuid (RO)                : be825ba2-01d7-8d51-9780-f82cfa64924
   name-label (RW): Group of NVIDIA Corporation GK104GL [GRID K2] GPUs
   name-description (RW):
[root@xenserver ~]#
```

To see detailed information about a gpu-group, use xe gpu-group-param-list:

```
[root@xenserver ~]# xe gpu-group-param-list uuid=be825ba2-01d7-8d51-9780-f82cfa64924
uuid (RO)                : be825ba2-01d7-8d51-9780-f82cfa64924
   name-label (RW): Group of NVIDIA Corporation GK104GL [GRID K2] GPUs
   name-description (RW):
   GPUs
      name-description (RW): 
      VGPU-uuids (SRO): 6493ff45-d895-764c-58d8-96f1bc0307aa; 8481cb68-66e5-25e6-0c0-bd691df682b3; b73cbb30-096f-8a9a-523e-a800062f4ca7

   allocation-algorithm (RW): depth-first
[root@xenserver ~]
```

5.1.4  vgpu

A vgpu object represents a virtual GPU. Unlike the other GPU management objects, vGPUs are not created automatically by XenServer; they are created when a VM is configured via XenCenter or via xe to use a vGPU, or by cloning a VM that is configured to use vGPU (see section 5.4).
5.2 CREATING A VGPU USINGXE

Use `xe vgpu-create` to create a `vgpu` object, specifying the type of vGPU required, the GPU group it will be allocated from, and the VM it is associated with:

\[
\begin{align*}
\text{[root@xenserver ~]# xe vgpu-create vm-uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2} \\
gpu-group-uuid=be825ba2-01d7-8d51-9780-f82cfaa64924 vgpu-type-uuid=3f318889-7508-c9fd-7134-003d4d05ae56 b73cbd30-096f-8a9a-523e-a800062f4ca7 \\
\text{[root@xenserver ~]#}
\end{align*}
\]

Creating the vGPU object for a VM does not immediately cause a virtual GPU to be created on a physical GPU. Instead, the vGPU is created whenever its associated VM is started. For more details on how vGPUs are created at VM startup, see section 5.3.

Note: the owning VM must be in the powered-off state in order for the `vgpu-create` command to succeed. A `vgpu` object’s owning VM, associated GPU group, and vGPU type are fixed at creation and cannot be subsequently changed. To change the type of vGPU allocated to a VM, delete the existing `vgpu` object and create another one.

5.3 CONTROLLING VGPU ALLOCATION

Configuring a VM to use a vGPU in XenCenter, or creating a `vgpu` object for a VM using `xe`, does not immediately cause a virtual GPU to be created; rather, the virtual GPU is created at the time the VM is next booted, using the following steps:

- The GPU group that the `vgpu` object is associated with is checked for a physical GPU that can host a vGPU of the required type (i.e. the `vgpu` object’s associated `vgpu-type`). Because vGPU types cannot be mixed on a single physical GPU, the new vGPU can only be created on a physical GPU that has no vGPUs resident on it, or only vGPUs of the same type, and less than the limit of vGPUs of that type that the physical GPU can support.
- If no such physical GPUs exist in the group, the `vgpu` creation fails and the VM startup is aborted.
- Otherwise, if more than one such physical GPU exists in the group, a physical GPU is selected according to the GPU group’s allocation policy, as described here:
5.3.1 GPU allocation policy

XenServer creates GPU groups with a default allocation policy of depth-first. The depth-allocation policy attempts to maximize the number of vGPUs running on each physical GPU within the group, by placing newly-created vGPUs on the physical GPU that can support the new vGPU and that has the most number of vGPUs already resident. This policy generally leads to higher density of vGPUs, particularly when different types of vGPUs are being run, but may result in lower performance because it attempts to maximize sharing of physical GPUs.

Conversely, a breadth-first allocation policy attempts to minimize the number of vGPUs running on each physical GPU within the group, by placing newly-created vGPUs on the physical GPU that can support the new vGPU and that has the least number of vGPUs already resident. This policy generally leads to higher performance because it attempts to minimize sharing of physical GPUs, but in doing so it may artificially limit the total number of vGPUs that can run.

The allocation policy of a GPU group is stored in the allocation-algorithm parameter of the gpu-group object, and can be changed using gpu-group-param-set:

```
[root@xenserver ~]# xe gpu-group-param-get uuid=be825ba2-01d7-8d51-9780-f82cf6aa64924 param-name=allocation-algorithm
depth-first
[root@xenserver ~]# xe gpu-group-param-set uuid=be825ba2-01d7-8d51-9780-f82cf6aa64924 allocation-algorithm=breadth-first
[root@xenserver ~]#
```

Allocation policy can also be controlled from the GPU tab in XenCenter:
5.3.2 Determining the physical GPU that a virtual GPU is resident on

The vgpu object’s resident-on parameter returns the UUID of the pgpu object for the physical GPU the vGPU is resident on:

```
[root@xenserver ~]# xe vgpu-param-get uuid=8481cb68-66e5-25e6-a0c0-bd691df682b3 param-name=resident-on
a4a4df34-4e5f-de9f-82d6-2134d9e339dc
```

```
[root@xenserver ~]# xe pgpu-param-list uuid=a4a4df34-4e5f-de9f-82d6-2134d9e339dc
uuid ( RO) : a4a4df34-4e5f-de9f-82d6-2134d9e339dc
  vendor-name ( RO): NVIDIA Corporation
  device-name ( RO): GK104GL [GRID K2]
  gpu-group-uuid ( RW): be825ba2-01d7-8d51-9780-f82cfaa64924
  gpu-group-name-label ( RO): Group of NVIDIA Corporation GK104GL [GRID K2]
```

GPUs

```
host-uuid ( RO): 6f6209a6-0f11-4c51-b12d-2bce361e9639
```
5.3.3 Controlling the vGPU types enabled on specific physical GPUs

Physical GPUs support several vGPU types, as defined in Table 1 on page 3, and the “passthrough” type that is used to assign an entire physical GPU to a VM (see section 5.5). To limit the types of vGPU that may be created on a specific vGPU, open the server’s GPU tab in XenCenter, check the box beside one or more GPUs, and select Edit Selected GPUs:

Note: If the vGPU is not currently running, the resident-on parameter is not instantiated for the vGPU, and the vgpu-param-get operation returns <not in database>.
Figure 20 Editing a GPU’s enabled vGPU types using XenCenter

Alternatively, modify the physical GPU’s pgpu object’s enabled-vGPU-types parameter use `xe pgpu-param-set`:

```
[root@xenserver ~]# xe pgpu-param-list uuid=f2607117-5b4c-d6cc-3900-00bf712e33f4

uuid (RO) : f2607117-5b4c-d6cc-3900-00bf712e33f4

vendor-name (RO): NVIDIA Corporation
device-name (RO): GK104GL [GRID K2]
gpu-group-uuid (RW): f46e2c69-412c-abc5-6d02-f74b7703cccc
gpu-group-name-label (RO): GRID K2 Socket 0
host-uuid (RO): d9eb9118-a5c5-49fb-970e-80e6a8f7ff98
host-name-label (RO): xenserver-vgx-test (VM IPs 10.31.223.0-49, dom0 .96, OOB .97)

resident-vGPUs (RO):
```
XenServer vGPU Management

5.3.4 Creating vGPUs on specific physical GPUs

To precisely control allocation of vGPUs on specific physical GPUs, create separate GPU groups for the physical GPUs you wish to allocate vGPUs on. When creating a virtual GPU, create it on the GPU group containing the physical GPU you want it to be allocated on.

For example, to create a new GPU group for the physical GPU at PCI bus ID 0000:05:0.0, start by creating the new GPU group with an appropriate name:

```
[root@xenserver ~]# xe gpu-group-create name-label="GRID K2 5:0.0"
585877ef-5a6c-66af-fc56-7bd525bdc2f6
[root@xenserver ~]#
```

Next, find the UUID of the physical GPU at 0000:05:0.0 that you wish to assign to the new GPU group:

```
[root@xenserver ~]# xe pgpu-list pci-id=0000:05:00.0
uuid ( RO) : 7c1e3cff-1429-0544-df3d-bf8a086fb70a
    vendor-name ( RO): NVIDIA Corporation
    device-name ( RO): GK104GL [GRID K2]
    gpu-group-uuid ( RW): be825ba2-01d7-8d51-9780-f82cfaa64924
[root@xenserver ~]
```

**Note:** the pci-id parameter passed to the pgpu-list command must be in the exact format shown, with the PCI domain fully specified (e.g. 0000) and the PCI bus and devices numbers each being two digits (e.g. 05:00.0).

Ensure that no vGPUs are currently operating on the physical GPU by checking the resident-VGPUs parameter:

```
[root@xenserver ~]# xe pgpu-param-get uuid=7c1e3cff-1429-0544-df3d-bf8a086fb70a param-name=resident-VGPUs
[root@xenserver ~]#
```

If any vGPUs are listed, shut down the VMs associated with them.
Now change the `gpu-group-uuid` parameter of the physical GPU to the UUID of the newly-created GPU group:

```
[root@xenserver ~]# xe pgpu-param-set uuid=7c1e3cff-1429-0544-df3d-bf8a086fb70a
gpu-group-uuid=585877ef-5a6c-66af-fc56-7bd525bd2ef6
[root@xenserver ~]#
```

Any `vgpu` object now created that specifies this GPU group UUID will always have its vGPUs created on the GPU at PCI bus ID 0000:05:0.0.

**Note:** you can add more than one physical GPU to a manually-created GPU group - for example, to represent all the GPUs attached to the same CPU socket in a multi-socket server platform - but as for automatically-created GPU groups, all the physical GPUs in the group must of the same type.

In XenCenter, manually-created GPU groups appear in the GPU type listing in a VM's GPU Properties. Select a GPU type within the group from which you wish the vGPU to be allocated:

![Figure 21 Using a custom GPU group within XenCenter](image)
5.4 CLONING VGPU-ENABLED VMS

XenServer’s fast-clone or copying feature can be used to rapidly create new VMs from a “golden” base VM image that has been configured with GRID vGPU, the NVIDIA driver, applications, and remote graphics software. Cloning/copying can be initiated via XenCenter (see Figure 22) or from the dom0 shell:

```
[root@xenserver ~]# xe vm-clone new-name-label="new-vm" vm="base-vm-name"
7f7035cb-388d-1537-1465-1857fb6498e7
[root@xenserver ~]#
```

When a VM is cloned, any vGPU configuration associated with the base VM is copied to the cloned VM. Starting the cloned VM will create a vGPU instance of the same type as the original VM, from the same GPU group as the original vGPU.

![Cloning a VM using XenCenter](image)

Figure 22 Cloning a VM using XenCenter

5.5 USING GPU PASS-THROUGH

GPU pass-through is used to directly assign an entire physical GPU to one VM, bypassing the GRID Virtual GPU Manager. In this mode of operation, the GPU is
accessed exclusively by the NVIDIA driver running in the VM to which it is assigned; the GPU is not shared among VMs.

GPU pass-through can be used in a server platform alongside GRID vGPU, with some restrictions:

- A physical GPU can host GRID vGPUs, or can be used for pass-through, but cannot do both at the same time.
- A physical GPU passed through to a VM cannot be performance-monitored via XenCenter or nvidia-smi (see Chapter 4)
- Passthrough GPUs do not provide console output via XenCenter’s VM Console tab. Use a remote graphics connection directly into the VM to access the VM’s OS.

To configure a VM for GPU pass-through, select the “Pass-through whole GPU” option as the GPU type in the VM’s Properties:

![Using XenCenter to configure a passthrough GPU](image)

Alternatively, create a `vgpu` object with the “passthrough” vGPU type:

```bash
[root@xenserver ~]# xe vgpu-type-list model-name="passthrough"
uuid (RO) : fa50b0f0-9705-6c59-689e-ea62a3d35237
    vendor-name (RO):
    model-name (RO): passthrough
```
framebuffer-size (RO): 0

[root@xenserver ~]# xe vgpu-create vm-uuid=753e77a9-e10d-7679-f674-65c078abb2eb vgpu-type-uuid=fa50b0f0-9705-6c59-689e-ea62a3d35237 gpu-group-uuid=585877ef-5a6c-66af-fc56-7bd525bdc2f6 6aa530ec-8f27-86bd-b8e4-fe4fde8f08f9
[root@xenserver ~]#

⚠️ **CAUTION:** Do not assign passthrough GPUs using the legacy `other-config:pci` parameter setting. This mechanism is not supported alongside the XenCenter UI and `xe vgpu` mechanisms, and attempts to use it may lead to undefined results.
Chapter 6. XENSERVER PERFORMANCE TUNING

This chapter provides recommendations on optimizing performance for VMs running with GRID vGPU on Citrix XenServer.

6.1 XENSERVER TOOLS

To get maximum performance out of a VM running on Citrix XenServer, regardless of whether you are using GRID vGPU, you must install Citrix XenServer tools within the VM. Without the optimized networking and storage drivers that the XenServer tools provide, remote graphics applications running on GRID vGPU will not deliver maximum performance.

6.2 USING REMOTE GRAPHICS

GRID vGPU implements a console VGA interface that permits the VM’s graphics output to be viewed via XenCenter’s console tab. This feature allows the desktop of a vGPU-enabled VM to be visible in XenCenter before any NVIDIA graphics driver is loaded in the virtual machine, but it is intended solely as a management convenience; it only supports output of vGPU’s primary display and isn’t designed or optimized to deliver high frame rates.

To deliver high frames from multiple heads on vGPU, we recommend installation of a high-performance remote graphics stack such as Citrix XenDesktop® with HDX 3D Pro remote graphics and, once this is done, disable vGPU’s console VGA.
6.2.1 Disabling console VGA

The console VGA interface in vGPU is optimized to consume minimal resources, but when a system is loaded with a high number of VMs, disabling the console VGA interface entirely may yield some performance benefit.

Once you have installed an alternate means of accessing a VM (such as XenDesktop or a VNC server), its vGPU console VGA interface can be disabled by specifying `disable_vnc=1` in the VM’s `platform:vgpu_extra_args` parameter:

```
[root@xenserver ~]# xe vm-param-set uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2 platform:vgpu_extra_args="disable_vnc=1"
```

The new console VGA setting takes effect the next time the VM is started or rebooted. With console VGA disabled, the XenCenter console will display the Windows boot splash screen for the VM, but nothing beyond that.

**CAUTION:** If you disable console VGA before you have installed/enabled an alternate mechanism to access the VM (such as XenDesktop), you will not be able to interact with the VM once it has booted.

You can recover console VGA access by removing the `vgpu_extra_args` key from the `platform` parameter, or by removing `disable_vnc=1` from the `vgpu_extra_args` key, or by setting `disable_vnc=0`. For example:

```
[root@xenserver ~]# xe vm-param-set uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2 platform:vgpu_extra_args="disable_vnc=0"
```
6.4 ALLOCATION STRATEGIES

6.4.1 NUMA considerations

Server platforms typically implement multiple CPU sockets, with system memory and PCI Express expansion slots local to each CPU socket, as illustrated in Figure 24:

![Figure 24 A NUMA server platform](image)

These platforms are typically configured to operate in Non-Uniform Memory Access (NUMA) mode; physical memory is arranged sequentially in the address space, with all the memory attached to each socket appearing in a single contiguous block of addresses. The cost of accessing a range of memory from a CPU or GPU varies; memory attached to the same socket as the CPU or GPU is accessible at lower latency than memory on another CPU socket, because accesses to remote memory must additionally traverse the interconnect between CPU sockets.

To obtain best performance on a NUMA platform, we recommend pinning VM vCPU cores to physical cores on the same CPU socket to which the physical GPU hosting the VM’s vGPU is attached. For example, using as a reference, a VM with a vGPU allocated on physical GPU 0 or 1 should have its vCPUs pinned to CPU cores on CPU socket 0. Similarly, a VM with a vGPU allocated on physical GPU 2 or 3 should have its vCPUs pinned to CPU cores on socket 1.

See Appendix A.5 for guidance on pinning vCPUs, and A.7 for guidance on determining which CPU socket a GPU is connected to. Section 5.3.3 describes how to precisely control which physical GPU is used to host a vGPU, by creating GPU groups for specific physical GPUs.
6.4.2 Maximizing performance

To maximize performance as the number of vGPU-enabled VMs on the platform increases, we recommend adopting a breadth-first allocation: allocate new VMs on the least-loaded CPU socket, and allocate the VM’s vGPU on an available, least-loaded, physical GPU connected via that socket.

XenServer’s creates GPU groups with a default allocation policy of depth-first. See section 5.3.1 for details on switching the allocation policy to breadth-first.

Note: Due to vGPU’s requirement that only one type of vGPU can run on a physical GPU at any given time, not all physical GPUs may be available to host the vGPU type required by the new VM.
This chapter describes basic troubleshooting steps for GRID vGPU on Citrix XenServer and VMware vSphere, and how to collect debug information when filing a bug report.

7.1 KNOWN ISSUES

Before troubleshooting or filing a bug report, review the release notes that accompany each driver release, for information about known issues with the current release, and potential workarounds.

7.2 TROUBLESHOOTING STEPS

If a vGPU-enabled VM fails to start, or doesn’t display any output when it does start, follow these steps to narrow down the probable cause.

7.2.1 Verify the NVIDIA kernel driver is loaded

On Citrix XenServer, use `lsmod` to verify that the kernel driver is loaded:

```
[root@xenserver ~]# lsmod|grep nvidia
nvidia        9604895  84
i2c_core      20294   2 nvidia,i2c_i801
[root@xenserver ~]#
```

On VMware vSphere, use `vmkload_mod`:
Troubleshooting

If the nvidia driver is not listed in the output, check dmesg for any load-time errors reported by the driver (see section 7.2.3). On XenServer, also use the ‘rpm -q’ command to verify that the NVIDIA GPU Manager package is correctly installed (see section 2.1.3.2).

7.2.2 Verify that nvidia-smi works

If the NVIDIA kernel driver is correctly loaded on the physical GPU, run nvidia-smi and verify that all physical GPUs not currently being used for GPU passthrough are listed in the output. For details on expected output, see section 4.1.

If nvidia-smi fails to report the expected output, check dmesg for NVIDIA kernel driver messages.

7.2.3 NVIDIA kernel driver output

Information and debug messages from the NVIDIA kernel driver are logged in kernel logs, prefixed with “NVRM” or ‘nvidia’. Run dmesg on both Citrix XenServer and VMware vSphere to check for these:

```
[root@xenserver ~]# dmesg | grep -E "NVRM|nvidia"
[  22.390414] NVRM: loading
[  22.829226] nvidia 0000:04:00.0: enabling device (0000 -> 0003)
[  22.829236] nvidia 0000:04:00.0: PCI INT A -> GSI 32 (level, low) -> IRQ 32
[  22.829241] NVRM: This PCI I/O region assigned to your NVIDIA device is invalid:
[  22.829241] NVRM: BAR0 is 0M @ 0x0 (PCI:0000:04.0)
[  22.829243] NVRM: The system BIOS may have misconfigured your GPU.
```

7.2.4 GRID Virtual GPU Manager messages

Information and debug messages from the GRID Virtual GPU Manager are logged to the hypervisor’s log files, prefixed with ‘vmiop’:

7.2.4.1 Citrix XenServer

GRID Virtual GPU Manager are written to /var/log/messages:

```
[root@xenserver ~]# grep vmiop /var/log/messages
```
Nov 8 09:17:44 xenserver-vgx-test2 fe: vgpu-2[14901]: vmiop_log: notice: vmiop-env: guest_max gpfn:0x10efff

}[root@esxi:~]

7.2.4.2 VMware vSphere

GRID Virtual GPU Manager are written to vmware.log in the guest VM's storage directory:

```
[root@esxi:~] grep vmiop /vmfs/volumes/datastore1/win7-vgpu-test1/vmware.log
2015-04-28T14:02:21.275Z| vmx| I120: DICT pciPassthru0.virtualDev = "vmiop"

[root@esxi:~]
```
7.3 FILING A BUG REPORT

When filing a bug report with NVIDIA, capture relevant configuration data from the platform exhibiting the bug, using `nvidia-bug-report.sh`. On Citrix XenServer, a server status report may be used as an alternative.

7.3.1 nvidia-bug-report.sh

Run `nvidia-bug-report.sh` from Citrix XenServer’s dom0 shell or VMware ESXi’s host shell to capture debug information into a gzip’d log file on the server. The example shows execution on Citrix XenServer, but the procedure is the same on vSphere ESXi:

```
[root@xenserver ~]# nvidia-bug-report.sh
```

`nvidia-bug-report.sh` will now collect information about your system and create the file 'nvidia-bug-report.log.gz' in the current directory. It may take several seconds to run. In some cases, it may hang trying to capture data generated dynamically by the Linux kernel and/or the NVIDIA kernel module. While the bug report log file will be incomplete if this happens, it may still contain enough data to diagnose your problem.

For Xen open source/XCP users, if you are reporting a domain issue, please run: `nvidia-bug-report.sh --domain-name <"domain_name"`

Please include the 'nvidia-bug-report.log.gz' log file when reporting your bug via the NVIDIA Linux forum (see devtalk.nvidia.com) or by sending email to 'linux-bugs@nvidia.com'.

Running `nvidia-bug-report.sh`...

If the bug report script hangs after this point consider running with `--safe-mode` command line argument.

```
complete.
```

[root@xenserver ~]#

7.3.2 XenServer status report

From XenCenter, select the Tools menu, Server Status Report, then select the XenServer instance from which you wish to collect a status report. Select the data to include in the report, check “NVIDIA-logs” to include GRID vGPU debug information, then generate the report.
Figure 25 Including NVIDIA logs in server status report
This appendix outlines basic operations on XenServer that are needed in order to install and configure GRID vGPU, and optimize XenServer operation with vGPU.

A.1 OPENING A DOM0 SHELL

Most configuration commands must be run in a command shell on XenServer’s dom0. There are two ways to open a shell on XenServer’s dom0; using the console window in XenCenter, or using a standalone secure shell (ssh) client:

A.1.1 Accessing the dom0 shell via XenCenter

To access the dom0 shell via XenCenter, in the left-hand pane click on the XenServer host you wish to connect to. Then click on the Console tab to open the XenServer’s console, and press enter to start a shell prompt:
A.1.2 Accessing the dom0 shell using ssh

To access the dom0 shell via an ssh client, you will need an ssh client suite such as putty on Windows, or the ssh client from OpenSSH on Linux.

Connect your ssh client to the management IP address of the XenServer, and log in as the root user.

A.2 COPYING FILES TO DOM0

Files can be easily copied to/from XenServer dom0 using an scp client or using a network-mounted filesystem.

A.2.1 Copying files using scp

Copying files using scp

scp is a secure copy program that is part of the ssh suite of applications. scp is implemented in dom0 and can be used to copy from a remote ssh-enabled server:

```
[root@xenserver ~]# scp root@10.31.213.96:/tmp/somefile .
The authenticity of host '10.31.213.96 (10.31.213.96)' can't be established.
```
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '10.31.213.96' (RSA) to the list of known hosts.
root@10.31.213.96's password:
somefile 100% 532 0.5KB/s 00:00
[root@xenserver ~]#

Alternatively, scp can be used to copy files from a remote system to XenServer. Using the pscp program from the putty suite on Windows:

C:\Users\nvidia> pscp somefile root@10.31.213.98:/tmp
root@10.31.213.98's password:
somefile | 80 kB | 80.1 kB/s | ETA: 00:00:00 | 100%
C:\Users\nvidia>

A.2.2 Copying files via a CIFS-mounted filesystem

Files can be copied to/from a CIFS/SMB file share by mounting the share from dom0.

The following example assumes that the fileshare is part of an Active Directory domain called domain.com, and user myuser has permissions to access the share. To mount a network share \myserver.domain.com\myshare at /mnt/myshare on dom0,

[root@xenserver ~]# mkdir /mnt/myshare
[root@xenserver ~]# mount -t cifs -o username=myuser,workgroup=domain.com //myserver.domain.com/myshare /mnt/myshare
Password:
[root@xenserver ~]#

When prompted for a password, enter the password for myuser in the domain.com domain. After completion, files can be copied to/from the fileshare by copying to/from /mnt/myshare:

[root@xenserver ~]# cp /mnt/myshare/NVIDIA-vgx-xenserver-6.2-331.59.1386.rpm .
[root@xenserver ~]#

A.3 DETERMINING A VM’S UUID

To determine a virtual machine’s UUID, use the xe vm-list command in a dom0 shell, or XenCenter:
A.3.1 Using xe vm-list

To list all VMs and their associated UUIDs, use xe vm-list:

```
[root@xenserver ~]# xe vm-list
uuid (RO) : 6b5585f6-bd74-2e3e-0e11-03b9281c3ade
  name-label (RW): vgx-base-image-win7-64
  power-state (RO): halted

uuid (RO) : fa3d15c7-7e88-4886-c36a-cdb23ed8e275
  name-label (RW): test-image-win7-32
  power-state (RO): halted

uuid (RO) : 501bb598-a9b3-4afc-9143-ff85635d5dc3
  name-label (RW): Control domain on host: xenserver
  power-state (RO): running

uuid (RO) : 8495adf7-be9d-eee1-327f-02e4f40714fc
  name-label (RW): vgx-base-image-win7-32
  power-state (RO): halted
```

To find the UUID of a specific named VM, use the name-label parameter to xe vm-list:

```
[root@xenserver ~]# xe vm-list name-label=test-image-win7-32
uuid (RO) : fa3d15c7-7e88-4886-c36a-cdb23ed8e275
  name-label (RW): test-image-win7-32
  power-state (RO): halted
```

A.3.2 Using XenCenter

In the left-hand pane click on the VM, then click on the General tab. The UUID is listed in the VM’s General Properties.
A.4 USING MORE THAN TWO VCPUS WITH WINDOWS CLIENT VMS

Window client operating systems support a maximum of two CPU sockets. When allocating vCPUs to virtual sockets within a guest VM, XenServer defaults to allocating one vCPU per socket; any more than two vCPUs allocated to the VM won’t be recognized by the Windows client OS.

To fix this, set `platform:cores-per-socket` to the number of vCPUs allocated to the VM:

```
[root@xenserver ~]# xe vm-param-set uuid=<vm-uuid> platform:cores-per-socket=4 VCPUs-max=4 VCPUs-at-startup=4
```

A.5 PINNING VMS TO A SPECIFIC CPU SOCKET AND CORES

Use `xe host-cpu-info` to determine the number of CPU sockets and logical CPU cores in the server platform. In this example the server implements 32 logical CPU cores across two sockets:

```
[root@xenserver ~]# xe host-cpu-info
cpu_count : 32
```
socket_count: 2
    vendor: GenuineIntel
    speed: 2600.064
modelname: Intel(R) Xeon(R) CPU E5-2670 0 @ 2.60GHz
    family: 6
    model: 45
stepping: 7
    flags: fpu de tsc msr pae mce cx8 apic sep mtrr mca cmov
    pat clflush acpi mmx fxsr sse sse2 ss ht nx constant_tsc nonstop_tsc aperfmperf
    pni pclmulqdq vmx est ssse3 sse4_1 sse4_2 x2apic popcnt aes hypervisor ida arat
    tpr_shadow vnmi fpxprec vpid
    features: 17bee3ff-bfebfbff-00000001-2c100800
    features_after_reboot: 17bee3ff-bfebfbff-00000001-2c100800
    physical_features: 17bee3ff-bfebfbff-00000001-2c100800
    maskable: full

To pin a VM’s vCPUs to a specific socket, set VCPUs-params:mask. This setting persists over VM reboots and shutdowns. In a dual socket platform with 32 total cores, cores 0-15 are on socket 0, and cores 16-31 are on socket 1. To restrict a VM to only run on socket 0:

[root@xenserver ~]# xe vm-param-set uuid=<vm-uuid> VCPUs-params:mask=0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15

Similarly, to restrict a VM to only run on socket 1:

[root@xenserver ~]# xe vm-param-set uuid=<vm-uuid> VCPUs-params:mask=16,17,18,19,20,21,22,23,24,25,26,27,28,29,30,31

To pin vCPUs to specific cores within a socket, specify the cores directly:

[root@xenserver ~]# xe vm-param-set uuid=<vm-uuid> VCPUs-params:mask=16,17,18,19

Use xl vcpu-list to list the current assignment of vCPUs to physical CPUs:

[root@xenserver ~]# xl vcpu-list
Name         ID VCPU CPU State Time(s) CPU Affinity
Domain-0     0  25  -b-  9188.4  any cpu
Domain-0     0  19  r--  8908.4  any cpu
Domain-0     0  30  -b-  6815.1  any cpu
Domain-0     0  17  -b-  4881.4  any cpu
Domain-0     0  22  -b-  4956.9  any cpu
Domain-0     0  20  -b-  4319.2  any cpu
Domain-0     0  28  -b-  5720.0  any cpu
A.6 CHANGING DOM0 VCPUS AND PINNING

The default number of vCPUs assigned to dom0 is 8. To change this number, modify the dom0_max_vcpus parameter in the Xen bootline. For example:

```
[root@xenserver ~]# /opt/xensource/libexec/xen-cmdline --set-xen
    dom0_max_vcpus=4
```

**Note:** After applying this setting, you must reboot the system for it to take effect. Use `shutdown -r now` to reboot the server, or reboot it from XenCenter.

By default, dom0’s vCPUs are unpinned, and able to run on any physical CPU in the system. To pin dom0 vCPUs to specific physical CPUs, use `xl vcpu-pin`. For example, to pin dom0’s vCPU 0 to physical CPU 18, use:

```
[root@xenserver ~]# xl vcpu-pin Domain-0 0 18
```

CPU pinnings applied this way take effect immediately but do not persist over reboots. To make settings persistent, add `xl vcpu-pin` commands into `/etc/rc.local`, for example:

```
xl vcpu-pin 0 0 0-15
xl vcpu-pin 0 1 0-15
xl vcpu-pin 0 2 0-15
xl vcpu-pin 0 3 0-15
xl vcpu-pin 0 4 16-31
xl vcpu-pin 0 5 16-31
xl vcpu-pin 0 6 16-31
xl vcpu-pin 0 7 16-31
```
A.7 DETERMINING GPU LOCALITY

As noted in section 6.4.1, current multi-socket, servers typically implement PCIe expansion slots local to each CPU socket and it is advantageous to pin VMs to the same socket that their associated physical GPU is connected to.

For current Intel platforms, CPU socket 0 typically has its PCIe root ports located on bus 0, so any GPU below a root port located on bus 0 is connected to socket 0. CPU socket 1 has its root ports on a higher bus number, typically bus 0x20 or bus 0x80 depending on the specific server platform.
