LIST OF TABLES

Table 1 Virtual GPUs licensed on Tesla M6, M60 ............................................. 4
Table 2 Licensing registry settings ..................................................................... 14
Certain NVIDIA GRID™ products, such as GRID vGPU™ and GRID Virtual Workstation, are available as licensed features on NVIDIA Tesla™ GPUs. This guide describes the licensed features and how to enable and use them on supported hardware.

1.1 HOW LICENSING WORKS

Figure 1 provides an overview of GRID licensing:
When enabled on Tesla GPUs, licensed features such as Virtual GPU are activated by obtaining a license over the network from an NVIDIA GRID License Server. The license is “checked out” or “borrowed” at the time the Virtual Machine (VM) is booted, and returned when the VM is shut down.

Note: Information on setting up and running the GRID License Server is provided in the NVIDIA GRID License Server User Guide.

1.2 LICENSE EDITIONS

GRID licenses come in three editions that enable different classes of GRID features. The GRID software automatically selects the right license edition based on the features being used:

<table>
<thead>
<tr>
<th>GRID License Edition</th>
<th>GRID Features</th>

</tr>
<tr>
<td></td>
<td>• Workstation graphics on GPU passthrough</td>
</tr>
</tbody>
</table>

Figure 2 GRID license editions

The remainder of this guide is organized as follows:

- Chapter 2 describes licensing of GRID Virtual GPU.
- Chapter 3 describes licensing of GRID Virtual Workstation features with GPU passthrough.
- Chapter 4 discusses advanced licensing settings.
- Chapter 5 provides guidance on troubleshooting.
Chapter 2. GRID VIRTUAL GPU

This chapter describes licensing of NVIDIA GRID vGPU.

2.1 VGPU LICENSE REQUIREMENTS

NVIDIA GRID Virtual GPU (vGPU) is offered as a licensable feature on Tesla M6 and M60 GPUs. When a vGPU is booted on these GPUs, a license must be obtained by the Virtual Machine (VM) in order to enable the full features of the vGPU. The VM retains the license until it is shut down; it then releases the license back to the license server.

Note: vGPUs that require licensing run at a reduced capability until a license is acquired. Screen resolution is limited to no higher than 1280x1024, frame rate is capped at 3 frames per second, and GPU resource allocations are limited, which will prevent some applications from running correctly. These restrictions are removed once a license is acquired.

NVIDIA GRID K1 and K2 GPUs do not require a license to run vGPU.

Table 1 lists the vGPU types that are supported on Tesla M6 / M60, and the license edition that each vGPU type requires.
### Table 1 Virtual GPUs licensed on Tesla M6, M60

<td></td>
<td></td>
</tr>
</tbody>
</table>

The higher-end GRID license editions are inclusive of lower editions: for example virtual GPUs that require a GRID Virtual PC license are also usable with a GRID Virtual Workstation or GRID Virtual Workstation Extended license.

Note: For more information on the virtual GPU types listed in Table 1, consult the NVIDIA GRID vGPU User Guide.

### 2.2 LICENSING ON WINDOWS

To license vGPU, open NVIDIA Control Panel by right-clicking on the Windows desktop and selecting **NVIDIA Control Panel** from the menu, or by opening Windows Control Panel and double-clicking the NVIDIA Control Panel icon.

In NVIDIA Control Panel, select **Manage License** task in the **Licensing** section of the navigation pane, as shown in Figure 3.
Note: If the Licensing section and Manage License task are not displayed in NVIDIA Control Panel, the vGPU you are running on does not require a license, or the system has been configured to hide licensing controls in NVIDIA Control Panel (see section Error! Reference source not found. on registry settings).

Figure 3 Managing vGPU licensing in NVIDIA Control Panel

The Manage License task pane shows that GRID vGPU is currently unlicensed. Enter the address of your local GRID License Server in the License Server field. The address can be a fully-qualified domain name such as gridlicense.mycompany.com, or an IP address such as 10.31.20.45.

The Port Number field can be left unset and will default to 7070, which is the default port number used by NVIDIA GRID License Server.

Select Apply to assign the settings. The system will request the appropriate license for the current vGPU from the configured license server and, if successful, vGPU’s full capabilities are enabled (see Figure 4). If the system fails to obtain a license, refer to 4.3 for guidance on troubleshooting.

Once configured in NVIDIA Control Panel, licensing settings persist across reboots.
Figure 4 Successful acquire of vGPU license
2.3 LICENSING ON LINUX

To license GRID vGPU, edit /etc/nvidia/gridd.conf:

```bash
[nvidia@localhost ~]$ sudo vi /etc/nvidia/gridd.conf
```

Set `ServerURL` to the address and port number of your local NVIDIA GRID License Server. The address can be a fully-qualified domain name such as gridlicense.mycompany.com, or an IP address such as 10.31.20.45. The port number is appended to the address with a colon, for example :7070.

Set `FeatureType` to 1, to license vGPU:

```plaintext
ServerUrl=hqdvls01.nvidia.com:7070
FeatureType=1
```

Figure 5 Sample gridd.conf for GRID vGPU

Restart the nvidia-gridd service:

```bash
[nvidia@localhost ~]$ sudo service nvidia-gridd restart
```

The service should automatically obtain a license. This can be confirmed with log messages written to /var/log/messages, and the vGPU within the VM should now exhibit full framerate, resolution, and display output capabilities:

```bash
[nvidia@localhost ~]$ sudo grep gridd /var/log/messages
... Sep 13 15:40:06 localhost nvidia-gridd: Started (10430)
Sep 13 15:40:24 localhost nvidia-gridd: License acquired successfully.
```

Once configured in gridd.conf, licensing settings persist across reboots and need only be modified if the license server address changes, or the VM is switched to running GPU passthrough.
This chapter describes how to enable the GRID Virtual Workstation feature on supported Tesla GPUs.

### 3.1 GRID VIRTUAL WORKSTATION FEATURES

GRID Virtual Workstation is available on Tesla GPUs running in GPU passthrough mode to Windows and Linux VMs. Virtual Workstation requires a GRID Virtual Workstation – Extended license edition, and provides these features:

- Up to four virtual display heads at 4k resolution (unlicensed Tesla GPUs support a single virtual display head with maximum resolution of 2560x1600).
- Workstation-specific graphics features and accelerations.
- Certified drivers for professional applications

### 3.2 LICENSING ON WINDOWS

To enable GRID Virtual Workstation, open NVIDIA Control Panel by right-clicking on the Windows desktop and selecting **NVIDIA Control Panel** from the menu, or by opening Windows Control Panel and double-clicking the NVIDIA Control Panel icon.

In NVIDIA Control Panel, select **Manage License** task in the **Licensing** section of the navigation pane, as shown in Figure 6.

 embod Note: If the Licensing section and Manage License task are not displayed in NVIDIA Control Panel, the GPU or driver you are using do not support NVIDIA GRID licensed features.
Figure 6 Managing Virtual Workstation Licensing in NVIDIA Control Panel

The **Manage License** task pane shows the current License Edition being used, and defaults to unlicensed.

Select **GRID Virtual Workstation**, and enter the address of your local GRID License Server in the **License Server** field (see Figure 7). The address can be a fully-qualified domain name such as `gridlicense.mycompany.com`, or an IP address such as `10.31.20.45`.

The **Port Number** field can be left unset and will default to `7070`, which is the default port number used by NVIDIA GRID License Server.
Select **Apply** to assign the settings. The system will request a license from the configured license server and, if successful, GRID Virtual Workstation features are enabled (see Figure 8). If the system fails to obtain a license, refer to 4.3 for guidance on troubleshooting.

Once configured in NVIDIA Control Panel, licensing settings persist across reboots.
3.2.1 Disabling GRID Virtual Workstation

To disable the GRID Virtual Workstation licensed feature, open NVIDIA Control Panel; in the Manage License task, select Tesla (unlicensed) and select Apply (see Figure 9). The setting does not take effect until the next time the system is shutdown or rebooted; GRID Virtual Workstation features remain available until then.
Figure 9 Disabling GRID Virtual Workstation
3.3 LICENSING ON LINUX

To license GRID Virtual Workstation, edit `/etc/nvidia/gridd.conf`:

[nvidia@localhost ~]$ sudo vi /etc/nvidia/gridd.conf

Set `ServerURL` to the address and port number of your local NVIDIA GRID License Server. The address can be a fully-qualified domain name such as `gridlicense.mycompany.com`, or an IP address such as `10.31.20.45`. The port number is appended to the address with a colon, for example `:7070`.

Set `FeatureType` to 2, to license GRID Virtual Workstation:

```
# /etc/nvidia/gridd.conf - Configuration file for NVIDIA Grid Daemon

# Description: Set License Server URL
# Data type: string
# Format:   "<address>:<port>"
ServerUrl=hqdvls01.nvidia.com:7070

# Description: Set Feature to be enabled
# Data type: integer
# Possible values:
#    1 => for GRID vGPU
#    2 => for GRID Virtual Workstation
FeatureType=2

# Description: Parameter to enable or disable Grid Licensing tab in nvidia-settings
# Data type: boolean
# Possible values: TRUE or FALSE, default is TRUE
#EnableUI=TRUE
```

Figure 10 Sample gridd.conf for GRID Virtual Workstation

Restart the `nvidia-gridd` service:

[nvidia@localhost ~]$ sudo service nvidia-gridd restart

The service should automatically obtain a license. This can be confirmed with log messages written to `/var/log/messages`, and the GPU should now exhibit Virtual Workstation display output and resolution capabilities:

```
[nvidia@localhost ~]$ sudo grep gridd /var/log/messages
...
Sep 13 15:40:06 localhost nvidia-gridd: Started (10430)
Sep 13 15:40:24 localhost nvidia-gridd: License acquired successfully.
```

Once configured in `gridd.conf`, licensing settings persist across reboots and need only be modified if the license server address changes, or the VM is switched to running GPU passthrough.
This chapter discusses advanced topics and settings for GRID licensing.

4.1 LICENSES OBTAINED AFTER BOOT

Under normal operation, a GRID license is obtained by a platform during boot, prior to user login and launch of applications. If a license is not available, indicated by a popup on Windows or log messages on Linux, the system will periodically retry its license request to the license server. During this time, GRID vGPU runs at reduced capability described in section 2.1; similarly, GRID Virtual Workstation features described in section 3.1 are not available.

When a license is obtained, the licensed features are dynamically enabled and become available for immediate use. However, any application software launched prior to the license becoming available may need to be restarted in order to recognize and utilize the licensed features.

4.2 OPERATING WITH INTERMITTENT CONNECTIVITY TO THE LICENSE SERVER

GRID vGPU and Virtual Workstation clients require connectivity to a license server when booting, in order to check out a license. Once booted, clients may operate without connectivity to the license server for a period of up to 7 days, after which time the client will warn of license expiration.
4.3 APPLYING WINDOWS LICENSE SETTINGS VIA REGISTRY

GRID licensing settings can be controlled via the Windows Registry, removing the need for manual interaction with NVIDIA Control Panel. Settings are stored in this registry key:

```
HKEY_LOCAL_MACHINE\SOFTWARE\NVIDIA Corporation\Global\GridLicensing
```

Registry values are summarized in Table 2.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServerAddress</td>
<td>String (REG_SZ)</td>
<td>License server address</td>
</tr>
<tr>
<td>ServerPort</td>
<td>String (REG_SZ)</td>
<td>License server port number (Optional: defaults to 7070)</td>
</tr>
<tr>
<td>FeatureType</td>
<td>DWord (REG_DWORD)</td>
<td>0: Unlicensed (Tesla edition) 1: GRID vGPU 2: GRID Virtual Workstation All other values reserved.</td>
</tr>
<tr>
<td>NvCplDisableManageLicensePage</td>
<td>DWord (REG_DWORD)</td>
<td>If this regkey is absent, licensing controls are shown in NVIDIA Control Panel for GPUs supporting licensing. When present: 0: Show licensing controls in NVIDIA Control Panel 1: Hide licensing controls in NVIDIA Control Panel All other values reserved.</td>
</tr>
</tbody>
</table>

Table 2 Licensing registry settings

Figure 11 shows an example of configuring virtual GPU licensing settings in the registry. Note it is sufficient to simply configure `FeatureType = 1` (GRID vGPU) and set the license server address in `ServerAddress`.
Figure 11 Configuring vGPU licensing via registry settings
Chapter 5. TROUBLESHOOTING

This chapter describes basic troubleshooting steps.

5.1 KNOWN ISSUES

Before troubleshooting or filing a bug report, review the release notes that accompany each driver release, for information about known issues with the current release, and potential workarounds.

5.2 TROUBLESHOOTING STEPS

If a GRID system fails to obtain a license, investigate the following as potential causes for the failure:

- Check that the license server address and port number are correctly configured.
- Run a network ping test from the GRID system to the license server address to verify that the system has network connectivity to the license server.
- Verify that the date and time are configured correctly on the GRID system. If the time is set inaccurately or is adjusted backwards by a large amount, the system may fail to obtain a license.
- Verify that the license server in use has available licenses of the type required by the GRID feature the GRID system is configured to use.
