VIRTUAL GPU SOFTWARE R418 FOR CITRIX HYPERVERSOR

RN-06927-001_v8.0 Revision 02 | April 2019

Release Notes
TABLE OF CONTENTS

Chapter 1. Release Notes........................................................................................................... 1
  1.1. Updates in Release 8.0................................................................................................. 2

Chapter 2. Validated Platforms................................................................................................. 3
  2.1. Supported NVIDIA GPUs and Validated Server Platforms...................................... 3
  2.2. Hypervisor Software Releases.................................................................................. 4
  2.3. Guest OS Support.................................................................................................... 6
    2.3.1. Windows Guest OS Support............................................................................... 6
    2.3.2. Linux Guest OS Support................................................................................... 7
  2.4. NVIDIA CUDA Toolkit Version Support.................................................................. 7

Chapter 3. Known Product Limitations.................................................................................... 9
  3.1. vGPU profiles with 512 Mbytes or less of frame buffer support only 1 virtual display head
      on Windows 10......................................................................................................... 9
  3.2. NVENC requires at least 1 Gbyte of frame buffer.................................................... 10
  3.3. VM running older NVIDIA vGPU drivers fails to initialize vGPU when booted............. 10
  3.4. Virtual GPU fails to start if ECC is enabled............................................................ 11
  3.5. Single vGPU benchmark scores are lower than pass-through GPU.......................... 13
  3.6. nvidia-smi fails to operate when all GPUs are assigned to GPU pass-through mode...... 14
  3.7. Windows Aero is disabled on Citrix Virtual Apps and Desktops session using 3 or 4 monitors
      in 2560×1600 resolution......................................................................................... 15
  3.8. VMs configured with large memory fail to initialize vGPU when booted...................... 15
  3.9. vGPU host driver RPM upgrade fails........................................................................ 16

Chapter 4. Resolved Issues...................................................................................................... 17

Chapter 5. Security Updates.................................................................................................. 18
  5.1. Restricting Access to GPU Performance Counters..................................................... 18
    5.1.1. Windows: Restricting Access to GPU Performance Counters for One User by Using
           NVIDIA Control Panel...................................................................................... 18
    5.1.2. Windows: Restricting Access to GPU Performance Counters Across an Enterprise by
           Using a Registry Key....................................................................................... 19
    5.1.3. Linux Guest VMs and Hypervisor Host: Restricting Access to GPU Performance
           Counters........................................................................................................... 19

Chapter 6. Known Issues.......................................................................................................... 21
  6.1. Incorrect GPU type shown for Quadro RTX 8000 GPUs in Citrix XenCenter.................. 21
  6.2. NVIDIA Notification Icon prevents log off of Citrix Published Application user sessions... 22
  6.3. Vulkan applications crash in Windows 7 guest VMs configured with NVIDIA vGPU......... 22
  6.4. Host core CPU utilization is higher than expected for moderate workloads................. 23
  6.5. Frame capture while the interactive logon message is displayed returns blank screen...... 23
  6.6. RDS sessions do not use the GPU with some Microsoft Windows Server releases............ 24
  6.7. Cloned VMs configured with a vGPU type different than the type in the master image fail to start...................................................................................................................... 25
  6.8. Even when the scheduling policy is equal share, unequal GPU utilization is reported...... 25
6.9. When the scheduling policy is fixed share, GPU utilization is reported as higher than expected.

6.10. nvidia-smi reports that vGPU migration is supported on all hypervisors.

6.11. NVIDIA Control Panel Crashes in a VM connected to two 4K displays.

6.12. vGPU guest VM driver not properly loaded on servers with more than 512 GB or 1 TB or more of system memory.

6.13. Luxmark causes a segmentation fault on an unlicensed Linux client.

6.14. Resolution is not updated after a VM acquires a license and is restarted.

6.15. On Tesla P40, P6, and P4 GPUs, the default ECC setting prevents NVIDIA vGPU from starting.

6.16. A segmentation fault in DBus code causes nvidia-gridd to exit on Red Hat Enterprise Linux and CentOS.

6.17. No Manage License option available in NVIDIA X Server Settings by default.

6.18. Licenses remain checked out when VMs are forcibly powered off.

6.19. Memory exhaustion can occur with vGPU profiles that have 512 Mbytes or less of frame buffer.

6.20. VM bug checks after the guest VM driver for Windows 10 RS2 is installed.

6.21. On Citrix Hypervisor 7.0, VMs unexpectedly reboot and Citrix Hypervisor crashes or freezes.

6.22. With no NVIDIA driver installed, Citrix Hypervisor misidentifies Tesla M10 cards.

6.23. GNOME Display Manager (GDM) fails to start on Red Hat Enterprise Linux 7.2 and CentOS 7.0.

6.24. Video goes blank when run in loop in Windows Media Player.

6.25. Local VGA console is momentarily unblanked when Citrix Virtual Apps and Desktops changes resolution of the VM desktop.

6.26. VM bugchecks on shutdown/restart when Citrix Virtual Apps and Desktops is installed and NVIDIA driver is uninstalled or upgraded.

6.27. Application frame rate may drop when running Citrix Virtual Apps and Desktops at 2560×1600 resolution.

6.28. Windows VM BSOD.

6.29. Windows VM BSOD when upgrading NVIDIA drivers over a Citrix Virtual Apps and Desktops session.

6.30. XenCenter does not allow vGPUs to be selected as a GPU type for Linux VMs.

6.31. If X server is killed on a RHEL7 VM running vGPU, XenCenter console may not automatically switch to text console.

6.32. Citrix Virtual Apps and Desktops shows only a black screen when connected to a vGPU VM42.
Chapter 1.
RELEASE NOTES

These Release Notes summarize current status, information on validated platforms, and known issues with NVIDIA vGPU software and associated hardware on Citrix Hypervisor.

The releases in this release family of NVIDIA vGPU software include the software listed in the following table:

<table>
<thead>
<tr>
<th>Software</th>
<th>8.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVIDIA Virtual GPU Manager for the Citrix Hypervisor releases listed in Hypervisor Software Releases</td>
<td>418.66</td>
</tr>
<tr>
<td>NVIDIA Windows driver</td>
<td>425.31</td>
</tr>
<tr>
<td>NVIDIA Linux driver</td>
<td>418.70</td>
</tr>
</tbody>
</table>

**Caution**

If you install the wrong NVIDIA vGPU software packages for the version of Citrix Hypervisor you are using, NVIDIA Virtual GPU Manager will fail to load.

The vGPU Manager and guest VM drivers must be installed together. Older VM drivers will not function correctly with this release of vGPU Manager. Similarly, older releases of vGPU Manager will not function correctly with this release of the guest VM drivers.

See VM running older NVIDIA vGPU drivers fails to initialize vGPU when booted.

This requirement does not apply to the NVIDIA vGPU software license sever. All releases of NVIDIA vGPU software are compatible with all releases of the license server.
1.1. Updates in Release 8.0

New Features in Release 8.0

- New -1B4 virtual GPU types
- XenMotion support on the following GPUs:
  - Tesla V100 SXM2
  - Tesla V100 SXM2 32GB
  - Tesla V100 PCIe
  - Tesla V100 PCIe 32GB
  - Tesla V100 FHHL
  - Quadro RTX 6000
  - Quadro RTX 8000

  For the complete list of GPUs that support XenMotion, see XenMotion with vGPU Support.

- Security updates
- Miscellaneous bug fixes

Hardware and Software Support Introduced in Release 8.0

- Support for the following GPUs:
  - Quadro RTX 6000
  - Quadro RTX 8000
- Support for the following OS releases as a guest OS:
  - Windows 10 October 2018 Update (1809)
  - Windows Server 2019

Feature Support Withdrawn in Release 8.0

- Citrix Hypervisor 7.5 is no longer supported.
Chapter 2.
VALIDATED PLATFORMS

This release family of NVIDIA vGPU software provides support for several NVIDIA GPUs on validated server hardware platforms, Citrix Hypervisor hypervisor software versions, and guest operating systems. It also supports the version of NVIDIA CUDA Toolkit that is compatible with R418 drivers.

2.1. Supported NVIDIA GPUs and Validated Server Platforms

This release of NVIDIA vGPU software provides support for the following NVIDIA GPUs on Citrix Hypervisor, running on validated server hardware platforms:

- GPUs based on the NVIDIA Maxwell™ graphic architecture:
  - Tesla M6
  - Tesla M10
  - Tesla M60
- GPUs based on the NVIDIA Pascal™ architecture:
  - Tesla P4
  - Tesla P6
  - Tesla P40
  - Tesla P100 PCIe 16 GB (XenMotion with vGPU is not supported.)
  - Tesla P100 SXM2 16 GB (XenMotion with vGPU is not supported.)
  - Tesla P100 PCIe 12GB (XenMotion with vGPU is not supported.)
- GPUs based on the NVIDIA Volta architecture:
  - Tesla V100 SXM2
  - Tesla V100 SXM2 32GB
  - Tesla V100 PCIe
  - Tesla V100 PCIe 32GB
Validated Platforms

- Tesla V100 FHHL
- GPUs based on the NVIDIA Turing architecture:
  - Tesla T4
  - Quadro RTX 6000
  - Quadro RTX 8000

For a list of validated server platforms, refer to NVIDIA GRID Certified Servers.

Tesla M60 and M6 GPUs support compute mode and graphics mode. NVIDIA vGPU requires GPUs that support both modes to operate in graphics mode.

Recent Tesla M60 GPUs and M6 GPUs are supplied in graphics mode. However, your GPU might be in compute mode if it is an older Tesla M60 GPU or M6 GPU, or if its mode has previously been changed.

To configure the mode of Tesla M60 and M6 GPUs, use the `gpumodeswitch` tool provided with NVIDIA vGPU software releases.

2.2. Hypervisor Software Releases

Changes to Citrix Product Names and Release Numbers

Citrix has changed the product names of its hypervisor and virtual desktop software.

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>XenServer</td>
<td>Citrix Hypervisor</td>
</tr>
<tr>
<td>XenApp and XenDesktop</td>
<td>Citrix Virtual Apps and Desktops</td>
</tr>
<tr>
<td>Citrix Receiver</td>
<td>Citrix Workspace App</td>
</tr>
</tbody>
</table>

The release number of Citrix Virtual Apps and Desktops releases after 7.18 is in the form `7 yyymm`, where `yyymm` denotes the year and month that the product was released. For example, for a product released in August 2018, `yyymm` is 1808

For more information, see these topics in the Citrix documentation:

- New product names
- New product and component version numbers
**Supported Citrix Hypervisor Releases**

This release family of NVIDIA vGPU software is supported on the Citrix Hypervisor releases listed in the table.

Support for NVIDIA vGPU software requires the Enterprise edition of Citrix Hypervisor. For details, see [Citrix XenServer Licensing FAQ (PDF)](https://www.nvidia.com). Cumulative update releases for a base release of Citrix Hypervisor are compatible with the base release and can also be used with this version of NVIDIA vGPU software unless expressly stated otherwise.

<table>
<thead>
<tr>
<th>Software</th>
<th>Releases Supported</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix Hypervisor (XenServer) 7.6</td>
<td>RTM build and compatible cumulative update releases</td>
<td>All NVIDIA GPUs that support NVIDIA vGPU software are supported. This release supports XenMotion with vGPU on suitable GPUs as listed in Supported NVIDIA GPUs and Validated Server Platforms.</td>
</tr>
<tr>

</tr>
<tr>
<td>Citrix Hypervisor (XenServer) 7.0</td>
<td>RTM build 125380 and compatible cumulative update releases</td>
<td>Not supported on Tesla T4. XenMotion with vGPU is not supported.</td>
</tr>
</tbody>
</table>

**Supported Virtual Desktop Software Releases**

This release supports **only** the virtual desktop software releases listed in the table.

<table>
<thead>
<tr>
<th>Software</th>
<th>Releases Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix Virtual Apps and Desktops</td>
<td>Versions 7 1903 and 7 1808 in HDX 3D Pro mode</td>
</tr>
<tr>
<td>XenApp/XenDesktop</td>
<td>Versions 7.18, 7.17, and 7.15 in HDX 3D Pro mode</td>
</tr>
</tbody>
</table>
2.3. Guest OS Support

NVIDIA vGPU software supports several Windows releases and Linux distributions as a guest OS. The supported guest operating systems depend on the hypervisor software version.

Use only a guest OS release that is listed as supported by NVIDIA vGPU software with your virtualization software. To be listed as supported, a guest OS release must be supported not only by NVIDIA vGPU software, but also by your virtualization software. NVIDIA cannot support guest OS releases that your virtualization software does not support.

NVIDIA vGPU software supports only 64-bit guest operating systems. No 32-bit guest operating systems are supported.

2.3.1. Windows Guest OS Support

NVIDIA vGPU software supports only the 64-bit Windows releases listed in the table as a guest OS on Citrix Hypervisor. The releases of Citrix Hypervisor for which a Windows release is supported depend on whether NVIDIA vGPU or pass-through GPU is used.

If a specific release, even an update release, is not listed, it’s not supported. XenMotion with vGPU is supported on supported Windows guest OS releases.

<table>
<thead>
<tr>
<th>Guest OS</th>
<th>NVIDIA vGPU - Citrix Hypervisor Releases</th>

<td>7.6, 7.1, 7.0</td>
<td>7.6, 7.1, 7.0</td>
</tr>
</tbody>
</table>
2.3.2. Linux Guest OS Support

NVIDIA vGPU software supports **only** the Linux distributions listed in the table as a guest OS on Citrix Hypervisor. The releases of Citrix Hypervisor for which a Linux release is supported depend on whether NVIDIA vGPU or pass-through GPU is used.

If a specific release, even an update release, is not listed, it’s **not** supported.

XenMotion with vGPU is **not** supported on any Linux guest OS release.

<table>
<thead>
<tr>

<td>7.6, 7.1, 7.0</td>
</tr>
</tbody>
</table>

2.4. NVIDIA CUDA Toolkit Version Support

The releases in this release family of NVIDIA vGPU software support NVIDIA CUDA Toolkit 10.1.

For more information about NVIDIA CUDA Toolkit, see CUDA Toolkit 10.1 Documentation.

2.5. XenMotion with vGPU Support

XenMotion with vGPU is supported only on a subset of supported GPUs, Citrix Hypervisor releases, and guest operating systems.

Supported GPUs:
Validated Platforms

- Tesla M6
- Tesla M10
- Tesla M60
- Tesla P4
- Tesla P6
- Tesla P40
- Tesla V100 SXM2
- Tesla V100 SXM2 32GB
- Tesla V100 PCIe
- Tesla V100 PCIe 32GB
- Tesla V100 FHHL
- Tesla T4
- Quadro RTX 6000
- Quadro RTX 8000

Supported Citrix Hypervisor releases: 7.6 only.

Supported guest OS releases: Windows only. XenMotion with vGPU is **not** supported on Linux.
Chapter 3. KNOWN PRODUCT LIMITATIONS

Known product limitations for this release of NVIDIA vGPU software are described in the following sections.

3.1. vGPU profiles with 512 Mbytes or less of frame buffer support only 1 virtual display head on Windows 10

Description
To reduce the possibility of memory exhaustion, vGPU profiles with 512 Mbytes or less of frame buffer support only 1 virtual display head on a Windows 10 guest OS.

The following vGPU profiles have 512 Mbytes or less of frame buffer:

- Tesla M6-0B, M6-0Q
- Tesla M10-0B, M10-0Q
- Tesla M60-0B, M60-0Q

Workaround
Use a profile that supports more than 1 virtual display head and has at least 1 Gbyte of frame buffer.
3.2. NVENC requires at least 1 Gbyte of frame buffer

Description

Using the frame buffer for the NVIDIA hardware-based H.264/HEVC video encoder (NVENC) may cause memory exhaustion with vGPU profiles that have 512 Mbytes or less of frame buffer. To reduce the possibility of memory exhaustion, NVENC is disabled on profiles that have 512 Mbytes or less of frame buffer. Application GPU acceleration remains fully supported and available for all profiles, including profiles with 512 MBytes or less of frame buffer. NVENC support from both Citrix and VMware is a recent feature and, if you are using an older version, you should experience no change in functionality.

The following vGPU profiles have 512 Mbytes or less of frame buffer:

- Tesla M6-0B, M6-0Q
- Tesla M10-0B, M10-0Q
- Tesla M60-0B, M60-0Q

Workaround

If you require NVENC to be enabled, use a profile that has at least 1 Gbyte of frame buffer.

3.3. VM running older NVIDIA vGPU drivers fails to initialize vGPU when booted

Description

A VM running a version of the NVIDIA guest VM drivers from a previous main release branch, for example release 4.4, will fail to initialize vGPU when booted on a Citrix Hypervisor platform running the current release of Virtual GPU Manager.

In this scenario, the VM boots in standard VGA mode with reduced resolution and color depth. The NVIDIA virtual GPU is present in Windows Device Manager but displays a warning sign, and the following device status:

Windows has stopped this device because it has reported problems. (Code 43)

Depending on the versions of drivers in use, the Citrix Hypervisor VM’s /var/log/messages log file reports one of the following errors:

- An error message:
Known Product Limitations

Virtual GPU Software R418 for Citrix Hypervisor

RN-06927-001_v8.0 Revision 02 | 11

vmiop_log: error: Unable to fetch Guest NVIDIA driver information

▶ A version mismatch between guest and host drivers:

vmiop_log: error: Guest VGX version(1.1) and Host VGX version(1.2) do not match

▶ A signature mismatch:

vmiop_log: error: VGPU message signature mismatch.

Resolution

Install the current NVIDIA guest VM driver in the VM.

3.4. Virtual GPU fails to start if ECC is enabled

Description

Tesla M60, Tesla M6, and GPUs based on the Pascal GPU architecture, for example Tesla P100 or Tesla P4, support error correcting code (ECC) memory for improved data integrity. Tesla M60 and M6 GPUs in graphics mode are supplied with ECC memory disabled by default, but it may subsequently be enabled using nvidia-smi. GPUs based on the Pascal GPU architecture are supplied with ECC memory enabled.

However, NVIDIA vGPU does not support ECC memory. If ECC memory is enabled, NVIDIA vGPU fails to start.

Citrix XenCenter displays the following error message:

An emulator required to run this VM failed to start

The following error is logged in the Citrix Hypervisor host's /var/log/messages log file:

vmiop_log: error: Initialization: VGX not supported with ECC Enabled.

Resolution

Ensure that ECC is disabled on all GPUs.

Before you begin, ensure that NVIDIA Virtual GPU Manager is installed on your hypervisor.

1. Use nvidia-smi to list the status of all GPUs, and check for ECC noted as enabled on GPUs.

```
# nvidia-smi -q
==============NVSMI LOG==============
Timestamp                           : Tue Dec 19 18:36:45 2017
Driver Version                      : 384.99
```
2. Change the ECC status to off on each GPU for which ECC is enabled.

   - If you want to change the ECC status to off for all GPUs on your host machine, run this command:

     ```bash
     # nvidia-smi -e 0
     ```

   - If you want to change the ECC status to off for a specific GPU, run this command:

     ```bash
     # nvidia-smi -i id -e 0
     ```

   *id* is the index of the GPU as reported by `nvidia-smi`.

   This example disables ECC for the GPU with index 0000:02:00.0.

3. Reboot the host.

   ```bash
   # shutdown -r now
   ```

4. Confirm that ECC is now disabled for the GPU.

   ```bash
   # nvidia-smi -q
   ```

   ===NVSMI LOG===

   Timestamp                           : Tue Dec 19 18:37:53 2017
   Driver Version                      : 384.99
   Attached GPUs                       : 1
   GPU 0000:02:00.0

   [...]

   Ecc Mode
   Current                     : Disabled
   Pending                     : Disabled

   [...]

   If you later need to enable ECC on your GPUs, run one of the following commands:

   - If you want to change the ECC status to on for all GPUs on your host machine, run this command:

     ```bash
     # nvidia-smi -e 1
     ```

   - If you want to change the ECC status to on for a specific GPU, run this command:

     ```bash
     # nvidia-smi -i id -e 1
     ```

   *id* is the index of the GPU as reported by `nvidia-smi`.  

This example enables ECC for the GPU with index 0000:02:00.0.

```bash
# nvidia-smi -i 0000:02:00.0 -e 1
```

After changing the ECC status to on, reboot the host.

### 3.5. Single vGPU benchmark scores are lower than pass-through GPU

**Description**

A single vGPU configured on a physical GPU produces lower benchmark scores than the physical GPU run in pass-through mode.

Aside from performance differences that may be attributed to a vGPU’s smaller frame buffer size, vGPU incorporates a performance balancing feature known as Frame Rate Limiter (FRL). On vGPUs that use the best-effort scheduler, FRL is enabled. On vGPUs that use the fixed share or equal share scheduler, FRL is disabled.

FRL is used to ensure balanced performance across multiple vGPUs that are resident on the same physical GPU. The FRL setting is designed to give good interactive remote graphics experience but may reduce scores in benchmarks that depend on measuring frame rendering rates, as compared to the same benchmarks running on a pass-through GPU.

**Resolution**

FRL is controlled by an internal vGPU setting. On vGPUs that use the best-effort scheduler, NVIDIA does not validate vGPU with FRL disabled, but for validation of benchmark performance, FRL can be temporarily disabled by specifying `frame_rate_limiter=0` in the VM’s `platform:vgpu_extra_args` parameter:

```
[root@xenserver ~]# xe vm-param-set uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2 platform:vgpu_extra_args="frame_rate_limiter=0"
[root@xenserver ~]#
```

The setting takes effect the next time the VM is started or rebooted.

With this setting in place, the VM’s vGPU will run without any frame rate limit. The FRL can be reverted back to its default setting in one of the following ways:

- Removing the `vgpu_extra_args` key from the `platform` parameter
- Removing `frame_rate_limiter=0` from the `vgpu_extra_args` key
- Setting `frame_rate_limiter=1`. For example:

```
[root@xenserver ~]# xe vm-param-set uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2 platform:vgpu_extra_args="frame_rate_limiter=1"
[root@xenserver ~]#
```
3.6. `nvidia-smi` fails to operate when all GPUs are assigned to GPU pass-through mode

**Description**

If all GPUs in the platform are assigned to VMs in pass-through mode, `nvidia-smi` will return an error:

```
[root@xenserver-vgx-test ~]# nvidia-smi
Failed to initialize NVML: Unknown Error
```

This is because GPUs operating in pass-through mode are not visible to `nvidia-smi` and the NVIDIA kernel driver operating in the Citrix Hypervisor dom0.

To confirm that all GPUs are operating in pass-through mode, use XenCenter’s GPU tab to review current GPU assignment:
Resolution
N/A

3.7. Windows Aero is disabled on Citrix Virtual Apps and Desktops session using 3 or 4 monitors in 2560×1600 resolution

Description
Windows Aero may be disabled when Citrix Virtual Apps and Desktops is connected to a VM with a vGPU or passthrough GPU, with 3 or 4 monitors at 2560×1600 resolution.

This limitation is a limitation of Windows 7. For details, see the Microsoft knowledge base article Desktop background disappears with very large extended desktop on Windows 7.

3.8. VMs configured with large memory fail to initialize vGPU when booted

Description
When starting multiple VMs configured with large amounts of RAM (typically more than 32GB per VM), a VM may fail to initialize vGPU. In this scenario, the VM boots in standard VGA mode with reduced resolution and color depth. The NVIDIA vGPU software GPU is present in Windows Device Manager but displays a warning sign, and the following device status:

Windows has stopped this device because it has reported problems. (Code 43)

The Citrix Hypervisor VM's /var/log/messages log file contains these error messages:

```plaintext
vmiop_log: error: NVOS status 0x29
vmiop_log: error: Assertion Failed at 0x7620fd4b:179
vmiop_log: error: 8 frames returned by backtrace ...
vmiop_log: error: VGPU message 12 failed, result code: 0x29
...
vmiop_log: error: NVOS status 0x8
vmiop_log: error: Assertion Failed at 0x7620c8df:280
vmiop_log: error: 8 frames returned by backtrace ...
vmiop_log: error: VGPU message 26 failed, result code: 0x8
```
Resolution

vGPU reserves a portion of the VM’s framebuffer for use in GPU mapping of VM system memory. The reservation is sufficient to support up to 32GB of system memory, and may be increased to accommodate up to 64GB by specifying `enable_large_sys_mem=1` in the VM’s platform:vgpu_extra_args parameter:

```
[root@xenserver ~]# xe vm-param-set uuid=e71afda4-53f4-3a1b-6c92-a364a7f619c2 platform:vgpu_extra_args="enable_large_sys_mem=1"
```

The setting takes effect the next time the VM is started or rebooted. With this setting in place, less GPU FB is available to applications running in the VM. To accommodate system memory larger than 64GB, the reservation can be further increased by specifying `extra_fb_reservation` in the VM’s platform:vgpu_extra_args parameter, and setting its value to the desired reservation size in megabytes. The default value of 64M is sufficient to support 64GB of RAM. We recommend adding 2M of reservation for each additional 1GB of system memory. For example, to support 96GB of RAM, set `extra_fb_reservation` to 128:

```
platform:vgpu_extra_args="enable_large_sys_mem=1, extra_fb_reservation=128"
```

The reservation can be reverted back to its default setting in one of the following ways:

- Removing the vgpu_extra_args key from the platform parameter
- Removing `enable_large_sys_mem` from the vgpu_extra_args key
- Setting `enable_large_sys_mem=0`

3.9. vGPU host driver RPM upgrade fails

Description

Upgrading vGPU host driver RPM fails with an error message about failed dependencies on the console.

```
[root@xenserver ~]# rpm –U NVIDIA-vGPU-xenserver-6.5-352.46.x86_64.rpm
error: Failed dependencies:
  NVIDIA-vgx-xenserver conflicts with NVIDIA-vGPU-xenserver-6.5-352.46.x86_64
[root@xenserver ~]# 
```

Resolution

Uninstall the older vGPU RPM before installing the latest driver.

Use the following command to uninstall the older vGPU RPM:

```
[root@xenserver ~]# rpm –e NVIDIA-vgx-xenserver
```
Chapter 4.
RESOLVED ISSUES

Only resolved issues that have been previously noted as known issues or had a noticeable user impact are listed. The summary and description for each resolved issue indicate the effect of the issue on NVIDIA vGPU software before the issue was resolved.

Issues Resolved in Release 8.0

</tbody>
</table>
5.1. Restricting Access to GPU Performance Counters

The NVIDIA graphics driver contains a vulnerability (CVE-2018-6260) that may allow access to application data processed on the GPU through a side channel exposed by the GPU performance counters. To address this vulnerability, update the driver and restrict access to GPU performance counters to allow access only by administrator users and users who need to use CUDA profiling tools.

The GPU performance counters that are affected by this vulnerability are the hardware performance monitors used by the CUDA profiling tools such as CUPTI, Nsight Graphics, and Nsight Compute. These performance counters are exposed on the hypervisor host and in guest VMs only as follows:

- On the hypervisor host, they are always exposed. However, the Virtual GPU Manager does not access these performance counters and, therefore, is not affected.
- In Windows and Linux guest VMs, they are exposed only in VMs configured for GPU pass through. They are not exposed in VMs configured for NVIDIA vGPU.

5.1.1. Windows: Restricting Access to GPU Performance Counters for One User by Using NVIDIA Control Panel

Perform this task from the guest VM to which the GPU is passed through.

Ensure that you are running NVIDIA Control Panel version 8.1.950.

1. Open NVIDIA Control Panel:
   - Right-click on the Windows desktop and select NVIDIA Control Panel from the menu.
   - Open Windows Control Panel and double-click the NVIDIA Control Panel icon.
2. In NVIDIA Control Panel, select the Manage GPU Performance Counters task in the Developer section of the navigation pane.

3. Complete the task by following the instructions in the Manage GPU Performance Counters > Developer topic in the NVIDIA Control Panel help.

**5.1.2. Windows: Restricting Access to GPU Performance Counters Across an Enterprise by Using a Registry Key**

You can use a registry key to restrict access to GPU Performance Counters for all users who log in to a Windows guest VM. By incorporating the registry key information into a script, you can automate the setting of this registry for all Windows guest VMs across your enterprise.

Perform this task from the guest VM to which the GPU is passed through.

**Caution** Only enterprise administrators should perform this task. Changes to the Windows registry must be made with care and system instability can result if registry keys are incorrectly set.

1. Set the RmProfilingAdminOnly Windows registry key to 1.

   [HKLM\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global\NVTweak]
   Value: "RmProfilingAdminOnly"
   Type: DWORD
   Data: 00000001

   The data value 1 restricts access, and the data value 0 allows access, to application data processed on the GPU through a side channel exposed by the GPU performance counters.

2. Restart the VM.

**5.1.3. Linux Guest VMs and Hypervisor Host: Restricting Access to GPU Performance Counters**

On systems where unprivileged users don't need to use GPU performance counters, restrict access to these counters to system administrators, namely users with the CAP_SYS_ADMIN capability set. By default, the GPU performance counters are not restricted to users with the CAP_SYS_ADMIN capability.

Perform this task from the guest VM to which the GPU is passed through or from your hypervisor host machine.

In Linux guest VMs, this task requires **sudo** privileges. On your hypervisor host machine, this task must be performed as the root user on the machine.

1. Log in to the guest VM or open a command shell on your hypervisor host machine.

2. Set the kernel module parameter NVreg_RestrictProfilingToAdminUsers to 1 by adding this parameter to the /etc/modprobe.d/nvidia.conf file.
If you are setting only this parameter, add an entry for it to the `/etc/modprobe.d/nvidia.conf` file as follows:

```plaintext
options nvidia
    NVreg_RegistryDwords="NVreg_RestrictProfilingToAdminUsers=1"
```

If you are setting multiple parameters, set them in a single entry as in the following example:

```plaintext
options nvidia NVreg_RegistryDwords="RmPVMRL=0x0"
    "NVreg_RestrictProfilingToAdminUsers=1"
```

If the `/etc/modprobe.d/nvidia.conf` file does not already exist, create it.

3. Restart the VM or reboot your hypervisor host machine.
6.1. Incorrect GPU type shown for Quadro RTX 8000 GPUs in Citrix XenCenter

Description

On the GPU tab in Citrix XenCenter, Quadro RTX 8000 GPUs are incorrectly shown as [QUADRO RTX 6000].

However, the virtual GPU types for a Quadro RTX 8000 GPU are listed correctly.

NVIDIA vGPU software does not support systems with a mixture of GPU types. Therefore, you can assume that any GPU in a system that you know to contain Quadro RTX 8000 GPUs that is shown as [QUADRO RTX 6000] is, in fact, a Quadro RTX 8000 GPU.

Status

Not an NVIDIA bug

Ref. #

200492607
6.2. **NVIDIA Notification Icon** prevents log off of Citrix Published Application user sessions

**Description**

By default on Windows Server operating systems, the **NVIDIA Notification Icon** application is started with every Citrix Published Application user session. This application might prevent the Citrix Published Application user session from being logged off even after the user has quit all other applications.

**Resolution**

Disable the **NVIDIA Notification Icon** application for Citrix Published Application user sessions as explained in *Virtual GPU Software User Guide*.

**Status**

Resolved by the provision of Windows registry keys for disabling the **NVIDIA Notification Icon** application for Citrix Published Application user sessions.

**Ref. #**

2206368

6.3. **Vulkan applications crash in Windows 7 guest VMs configured with NVIDIA vGPU**

**Description**

In Windows 7 guest VMs configured with NVIDIA vGPU, applications developed with Vulkan APIs crash or throw errors when they are launched. Vulkan APIs require sparse texture support, but in Windows 7 guest VMs configured with NVIDIA vGPU, sparse textures are not enabled.

In Windows 10 guest VMs configured with NVIDIA vGPU, sparse textures are enabled and applications developed with Vulkan APIs run correctly in these VMs.

**Status**

Open
6.4. Host core CPU utilization is higher than expected for moderate workloads

Description
When GPU performance is being monitored, host core CPU utilization is higher than expected for moderate workloads. For example, host CPU utilization when only a small number of VMs are running is as high as when several times as many VMs are running.

Workaround
Disable monitoring of the following GPU performance statistics:
- vGPU engine usage by applications across multiple vGPUs
- Encoder session statistics
- Frame buffer capture (FBC) session statistics
- Statistics gathered by performance counters in guest VMs

Status
Open

6.5. Frame capture while the interactive logon message is displayed returns blank screen

Description
Because of a known limitation with NvFBC, a frame capture while the interactive logon message is displayed returns a blank screen.

An NvFBC session can capture screen updates that occur after the session is created. Before the logon message appears, there is no screen update after the message is shown and, therefore, a black screen is returned instead. If the NvFBC session is created after this update has occurred, NvFBC cannot get a frame to capture.
Workaround

See Black Screen at Logon with Nvidia HDX 3D Pro enabled in the Citrix knowledge base.

Status

Not a bug

Ref. #

2115733

6.6. RDS sessions do not use the GPU with some Microsoft Windows Server releases

Description

When some releases of Windows Server are used as a guest OS, Remote Desktop Services (RDS) sessions do not use the GPU. With these releases, the RDS sessions by default use the Microsoft Basic Render Driver instead of the GPU. This default setting enables 2D DirectX applications such as Microsoft Office to use software rendering, which can be more efficient than using the GPU for rendering. However, as a result, 3D applications that use DirectX are prevented from using the GPU.

Version

- Windows Server 2016
- Windows Server 2012

Solution

Change the local computer policy to use the hardware graphics adapter for all RDS sessions.

2. Set the Use the hardware default graphics adapter for all Remote Desktop Services sessions option.
6.7. Cloned VMs configured with a vGPU type different than the type in the master image fail to start

**Description**

Cloned VMs configured with a vGPU type different than the type in the master image fail to start.

When a Windows 10 VM is booted, the VM becomes stuck in a loop and alternately displays *Getting devices ready: 50%* and *Preparation in progress*.

**Workaround**

Create one master image for each vGPU type that you want to use. Do not attempt to configure a cloned VM with a vGPU type different than the type in the master image.

**Status**

Open

2285306

6.8. Even when the scheduling policy is equal share, unequal GPU utilization is reported

**Description**

When the scheduling policy is equal share, unequal GPU engine utilization can be reported for the vGPUs on the same physical GPU.

For example, GPU engine usage for three P40-8Q vGPUs on a Tesla P40 GPU might be reported as follows:

```
[root@localhost:~] nvidia-smi vgpu
Wed Jun 27 10:33:18 2018
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 390.59                 Driver Version: 390.59                    |
|-------------------------------+--------------------------------+------------|
| GPU  Name                     | Bus-Id                         | GPU-Util   |
|      vGPU ID    Name          | VM ID    VM Name               | vGPU-Util  |
|===============================+================================+============|
|   0  Tesla P40                | 00000000:81:00.0               |  52%       |
|      2122661    GRID P40-8Q   | 2122662  centos7.4-xmpl-211... |     19%    |
```
The vGPU utilization of the vGPU 2122658 is reported as 59%. However, the expected vGPU utilization should not exceed 33%.

This behavior is a result of the mechanism that is used to measure GPU engine utilization.

**Status**

Open

**Ref. #**

2175888

### 6.9. When the scheduling policy is fixed share, GPU utilization is reported as higher than expected

**Description**

When the scheduling policy is fixed share, GPU engine utilization can be reported as higher than expected for a vGPU.

For example, GPU engine usage for six P40-4Q vGPUs on a Tesla P40 GPU might be reported as follows:

```
[root@localhost:~] nvidia-smi vgpu
Mon Aug 20 10:33:18 2018
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 390.42                 Driver Version: 390.42                    |
|-------------------------------+--------------------------------+------------|
| GPU  Name                     | Bus-Id                         | GPU-Util   |
|      vGPU ID    Name          | VM ID    VM Name               | vGPU-Util  |
|===============================+================================+============|
|   0  Tesla P40                | 00000000:81:00.0               |  99%       |
| 85109      GRID P40-4Q   | 85110    win7-xmpl-146048-1    |     32%    |
| 87195      GRID P40-4Q   | 87196    win7-xmpl-146048-2    |     39%    |
| 88095      GRID P40-4Q   | 88096    win7-xmpl-146048-3    |     26%    |
| 89170      GRID P40-4Q   | 89171    win7-xmpl-146048-4    |      0%    |
| 90475      GRID P40-4Q   | 90476    win7-xmpl-146048-5    |      0%    |
| 93363      GRID P40-4Q   | 93364    win7-xmpl-146048-6    |      0%    |
+-------------------------------+--------------------------------+------------|
|   1  Tesla P40                | 00000000:85:00.0               |   0%       |
+-------------------------------+--------------------------------+------------+
```
The vGPU utilization of vGPU 85109 is reported as 32%. For vGPU 87195, vGPU utilization is reported as 39%. And for 88095, it is reported as 26%. However, the expected vGPU utilization of any vGPU should not exceed approximately 16.7%.

This behavior is a result of the mechanism that is used to measure GPU engine utilization.

#### 6.11. NVIDIA Control Panel Crashes in a VM connected to two 4K displays

### Description
When NVIDIA Control Panel is started in a VM connected through a pass-through GPU to two 4K displays, a Citrix HDX 3D Pro Warning pop-up window opens containing the following error message:

```
Full screen applications are not supported on Citrix HDX 3D Pro. Press Ok to exit
```

NVIDIA Control Panel then crashes.
After the VM is rebooted, **NVIDIA Control Panel** is available again.

**Version**

Citrix Virtual Apps and Desktops 7.16

**Status**

Not an NVIDIA bug

**Ref. #**

200393766

### 6.12. vGPU guest VM driver not properly loaded on servers with more than 512 GB or 1 TB or more of system memory

**Description**

If PV IOMMU is enabled, support for vGPU is limited to servers with a maximum of 512 GB of system memory. On servers with more than 512 GB of system memory and PV IOMMU enabled, the guest VM driver is not properly loaded. **Device Manager** marks the vGPU with a yellow exclamation point.

If PV IOMMU is disabled, support for vGPU is limited to servers with less than 1 TB of system memory. This limitation applies only to systems with supported GPUs based on the Maxwell architecture: Tesla M6, Tesla M10, and Tesla M60. On servers with 1 TB or more of system memory, VMs configured with vGPU fail to power on. However, support for GPU pass through is not affected by this limitation.

**Resolution**

1. If PV IOMMU is enabled, disable it.

   ```bash
   [root@xenserver ~]# /opt/xensource/libexec/xen-cmdline --set-xen iommu=dom0-passthrough
   ```

2. If the server has 1 TB or more of system memory, limit the amount of system memory on the server to 1 TB minus 16 GB.

   If the server has less than 1 TB or more of system memory, omit this step.

3. Reboot the server.

**Status**

Not an NVIDIA bug
6.13. Luxmark causes a segmentation fault on an unlicensed Linux client

Description
If the Luxmark application is run on a Linux guest VM configured with NVIDIA vGPU that is booted without acquiring a license, a segmentation fault occurs and the application core dumps. The fault occurs when the application cannot allocate a CUDA object on NVIDIA vGPUs where CUDA is disabled. On NVIDIA vGPUs that can support CUDA, CUDA is disabled in unlicensed mode.

Status
Not an NVIDIA bug.

200269717

6.16. A segmentation fault in DBus code causes nvidia-gridd to exit on Red Hat Enterprise Linux and CentOS

Description
On Red Hat Enterprise Linux 6.8 and 6.9, and CentOS 6.8 and 6.9, a segmentation fault in DBus code causes the nvidia-gridd service to exit.

The nvidia-gridd service uses DBus for communication with NVIDIA X Server Settings to display licensing information through the Manage License page. Disabling the GUI for licensing resolves this issue.

To prevent this issue, the GUI for licensing is disabled by default. You might encounter this issue if you have enabled the GUI for licensing and are using Red Hat Enterprise Linux 6.8 or 6.9, or CentOS 6.8 and 6.9.

Version
Red Hat Enterprise Linux 6.8 and 6.9
CentOS 6.8 and 6.9

Status
Open

6.17. No Manage License option available in NVIDIA X Server Settings by default

Description
By default, the Manage License option is not available in NVIDIA X Server Settings. This option is missing because the GUI for licensing on Linux is disabled by default to work around the issue that is described in A segmentation fault in DBus code causes nvidia-gridd to exit on Red Hat Enterprise Linux and CentOS.

Workaround
This workaround requires sudo privileges.

Do not use this workaround with Red Hat Enterprise Linux 6.8 and 6.9 or CentOS 6.8 and 6.9. To prevent a segmentation fault in DBus code from causing the nvidia-gridd service from exiting, the GUI for licensing must be disabled with these OS versions.

1. If NVIDIA X Server Settings is running, shut it down.
2. If the /etc/nvidia/gridd.conf file does not already exist, create it by copying the supplied template file /etc/nvidia/gridd.conf.template.
3. As root, edit the /etc/nvidia/gridd.conf file to set the EnableUI option to TRUE.
4. Start the nvidia-gridd service.

    # sudo service nvidia-gridd start

When NVIDIA X Server Settings is restarted, the Manage License option is now available.
6.18. Licenses remain checked out when VMs are forcibly powered off

Description
NVIDIA vGPU software licenses remain checked out on the license server when non-persistent VMs are forcibly powered off.

The NVIDIA service running in a VM returns checked out licenses when the VM is shut down. In environments where non-persistent licensed VMs are not cleanly shut down, licenses on the license server can become exhausted. For example, this issue can occur in automated test environments where VMs are frequently changing and are not guaranteed to be cleanly shut down. The licenses from such VMs remain checked out against their MAC address for seven days before they time out and become available to other VMs.

Resolution
If VMs are routinely being powered off without clean shutdown in your environment, you can avoid this issue by shortening the license borrow period. To shorten the license borrow period, set the LicenseInterval configuration setting in your VM image. For details, refer to Virtual GPU Client Licensing User Guide.

Status
Closed

1694975

6.19. Memory exhaustion can occur with vGPU profiles that have 512 Mbytes or less of frame buffer

Description
Memory exhaustion can occur with vGPU profiles that have 512 Mbytes or less of frame buffer.
Known Issues

This issue typically occurs in the following situations:

- Full screen 1080p video content is playing in a browser. In this situation, the session hangs and session reconnection fails.
- Multiple display heads are used with Citrix Virtual Apps and Desktops or VMware Horizon on a Windows 10 guest VM.
- Higher resolution monitors are used.
- Applications that are frame-buffer intensive are used.
- NVENC is in use.

To reduce the possibility of memory exhaustion, NVENC is disabled on profiles that have 512 Mbytes or less of frame buffer.

When memory exhaustion occurs, the NVIDIA host driver reports Xid error 31 and Xid error 43 in the Citrix Hypervisor /var/log/messages file.

The following vGPU profiles have 512 Mbytes or less of frame buffer:

- Tesla M6-0B, M6-0Q
- Tesla M10-0B, M10-0Q
- Tesla M60-0B, M60-0Q

The root cause is a known issue associated with changes to the way that recent Microsoft operating systems handle and allow access to overprovisioning messages and errors. If your systems are provisioned with enough frame buffer to support your use cases, you should not encounter these issues.

Workaround

- Use an appropriately sized vGPU to ensure that the frame buffer supplied to a VM through the vGPU is adequate for your workloads.
- Monitor your frame buffer usage.
- If you are using Windows 10, consider these workarounds and solutions:
  - Use a profile that has 1 Gbyte of frame buffer.
  - Optimize your Windows 10 resource usage.

To obtain information about best practices for improved user experience using Windows 10 in virtual environments, complete the NVIDIA GRID vGPU Profile Sizing Guide for Windows 10 download request form.

For more information, see also Windows 10 Optimization for XenDesktop on the Citrix blog.

6.20. VM bug checks after the guest VM driver for Windows 10 RS2 is installed

Description

When the VM is rebooted after the guest VM driver for Windows 10 RS2 is installed, the VM bug checks. When Windows boots, it selects one of the standard supported video modes. If Windows is booted directly with a display that is driven by an NVIDIA driver, for example a vGPU on Citrix Hypervisor, a blue screen crash occurs.

This issue occurs when the screen resolution is switched from VGA mode to a resolution that is higher than 1920×1200.

Fix

Download and install Microsoft Windows Update KB4020102 from the Microsoft Update Catalog.

Workaround

If you have applied the fix, ignore this workaround.

Otherwise, you can work around this issue until you are able to apply the fix by not using resolutions higher than 1920×1200.

1. Choose a GPU profile in Citrix XenCenter that does not allow resolutions higher than 1920×1200.
2. Before rebooting the VM, set the display resolution to 1920×1200 or lower.

Status

Not an NVIDIA bug

6.27. Application frame rate may drop when running Citrix Virtual Apps and Desktops at 2560×1600 resolution.

Description
An application’s rendering frame rate may drop when running Citrix Virtual Apps and Desktops at 2560×1600 resolution, relative to the frame rate obtained at lower resolutions.
Fix

Using the Windows `regedit` utility within the VM, open the `HKLM\SOFTWARE \Citrix\Graphics` registry key and create a new DWORD value, `EncodeSpeed`, with a value of 2. Reboot the VM. This setting may improve the delivered frame rate at the expense of a reduction in image quality.

6.28. Windows VM BSOD

Description

Windows VM bugchecks on Citrix Hypervisor when running a large number of vGPU based VMs.

The Citrix Hypervisor `/var/log/messages` file contains these error messages:

```plaintext
NVRM: Xid (PCI:0000:08:00): 31, Ch 0000001e, engmask 00000111, intr 10000000

```

Version

Citrix Hypervisor 6.2

Fix

Ensure that you are running the latest OEM firmware for your NVIDIA vGPU software boards.
6.29. Windows VM BSOD when upgrading NVIDIA drivers over a Citrix Virtual Apps and Desktops session

Description
Windows VM bugchecks when NVIDIA guest drivers are upgraded over a Citrix Virtual Apps and Desktops session.
If the VM is restarted after the bugcheck, the upgraded driver loads correctly and full functionality is available.

Fix
Upgrade Citrix Virtual Apps and Desktops to 7.6 Feature Pack 3

6.30. XenCenter does not allow vGPUs to be selected as a GPU type for Linux VMs

Description
When creating a new Linux VM or editing the properties of an existing Linux VM, XenCenter does not allow vGPUs to be selected as a GPU type.

vGPU on Linux VMs is supported as a technical preview on Citrix Hypervisor 6.5, and does include XenCenter integration.
**Version**

Affects the XenCenter integration with Citrix Hypervisor 6.5 only.
Resolved in the XenCenter integration with Citrix Hypervisor 7.0.

**Workaround**

Refer to XenServer vGPU Management in *Virtual GPU Software User Guide* for how to configure vGPU by using the `xe` CLI.

6.31. If X server is killed on a RHEL7 VM running vGPU, XenCenter console may not automatically switch to text console

**Description**

If X server is killed on a RHEL7 VM running vGPU, XenCenter console may display a corrupted image and fail to switch over to text console.

The failure to switch over to text console is due to a bug in RHEL7, which causes X server to not start correctly under certain configurations.

**Workaround**

Use `CTRL+ALT+F1`, `F2`, or `F3` to switch between Linux terminals.

6.32. Citrix Virtual Apps and Desktops shows only a black screen when connected to a vGPU VM

Description

Citrix Virtual Apps and Desktops sometimes displays only a black screen when it is connected to an NVIDIA vGPU VM. The probable cause is that the display that is connected to the NVIDIA vGPU is entering a lower power state.

Fix

Disable all display-related power management settings.

For detailed instructions, visit Microsoft power plans frequently asked questions and from the list, select your OS version.

Status

Not an NVIDIA bug
