Chapter 1.

WHAT'S NEW

Welcome to the 21.5 release of the NVIDIA HPC SDK, a comprehensive suite of compilers and libraries enabling developers to program the entire HPC platform, from the GPU foundation to the CPU and out through the interconnect.

Key features that are new in this release of the NVIDIA HPC SDK for Linux include:

- ▶ Production support for a subset of OpenMP target offload features is now available for all supported Linux systems with V100 or later NVIDIA GPUs. Please refer to the "OpenMP" section of the HPC Compiler User's Guide for more information.
- ▶ A subset of Arm Neon intrinsics have been implemented in the HPC Compilers and can be enabled with `-Mneon_intrinsics`.
- ▶ NVSHMEM has been upgraded to version 2.1.2. As this is a major-version change, there are some breaking API changes; please see the NVSHMEM documentation for details.

3.2. Supported CUDA Toolchain Versions

The NVIDIA HPC SDK uses elements of the CUDA toolchain when building programs for execution with NVIDIA GPUs. Every HPC SDK installation package puts the required CUDA components into an installation directory called `[install-prefix]/[arch]/[nvhpc-version]/cuda`.

An NVIDIA CUDA GPU device driver must be installed on a system with a GPU before you can run a program compiled for the GPU on that system. The NVIDIA HPC SDK does not contain CUDA Drivers. You must download and install the appropriate [CUDA Driver from NVIDIA](#), including the [CUDA Compatibility Platform](#) if that is required.

The `nvaccelinfo` tool prints the CUDA Driver version in its output. You can use it to find out which version of the CUDA Driver is installed on your system.

The NVIDIA HPC SDK 21.5 includes the following CUDA toolchain versions:

- ▶ CUDA 10.2
- ▶ CUDA 11.0
- ▶ CUDA 11.3

The minimum required CUDA driver versions are listed in the table in Section 3.1.

Chapter 4.

KNOWN LIMITATIONS

- ▶ The cuda-gdb debugger is included in this release. Currently, Fortran arrays with non-constant bounds are not handled correctly and querying values will yield incorrect results. Stepping through CUDA Fortran and OpenACC kernels is partially supported, but incorrect line numbers are displayed. For additional general limitations with cuda-gdb, please refer to its documentation.
- ▶ When using `-stdpar` to accelerate C++ parallel algorithms, the algorithm calls cannot include virtual function calls or function calls through a function pointer, cannot use C++ exceptions, can only dereference pointers that point to the heap, and must use random access iterators (raw pointers as iterators work best).
- ▶ When `nvc++ -stdpar=multicore` is used to generate parallel code, OpenMP pragmas in the same translation unit will also be enabled.

Chapter 5. DEPRECATIONS

- ▶ Support for the KNL architecture of multicore CPUs in the NVIDIA HPC SDK was deprecated in the 21.3 release.
- ▶ Starting with the 21.5 release of the NVIDIA HPC SDK, the `-cuda` option for `NVC++` and `NVFORTRAN` no longer automatically links the NVIDIA GPU math libraries. Please refer to the `-cudalib` option.
- ▶ Support for the Kepler architecture of NVIDIA GPUs was deprecated starting with the 21.3 release of the NVIDIA HPC SDK.
