Chapter 1. INTRODUCTION

NVIDIA Nsight Compute CLI (ncu) provides a non-interactive way to profile applications from the command line. It can print the results directly on the command line or store them in a report file. It can also be used to simply launch the target application (see General for details) and later attach with NVIDIA Nsight Compute or another ncu instance.

For users migrating from nvprof to NVIDIA Nsight Compute, please additionally see the Nvprof Transition Guide for comparison of features and workflows.

Chapter 2. QUICKSTART

1. Launch the target application with the command line profiler

The command line profiler launches the target application, instruments the target API, and collects profile results for the specified kernels. The CLI executable is called ncu. A shortcut with this name is located in the base directory of the NVIDIA Nsight Compute installation. The actual executable is located in the folder target \windows-desktop-win7-x64 on Windows or target/linux-desktop-glibc_2_11_3-x64 on Linux. By default, NVIDIA Nsight Compute is installed in /usr/local/cuda-<cuda-version>/NsightCompute-<version> on Linux and in C:\Program Files\NVIDIA Corporation\Nsight Compute <version> on Windows.

To collect the **basic** set for all kernel launches in the target application, launch:

```
$ ncu -o profile CuVectorAddMulti.exe
```

The application runs in instrumented mode and for each kernel launch, a profile result is created. The results are written by default to profile.nsight-cuprof. Each output from the compute profiler starts with **==PROF==** The other lines are output from the application itself. For each profiled kernel, the name of the kernel function and the progress of data collection is shown. To collect all requested profile information, it may be required to replay the kernels multiple times. The total number of replay passes per kernel is shown after profiling has completed.

```
[Vector addition of 1144477 elements]
==PROF== Connected to process 5268
Copy input data from the host memory to the CUDA device
CUDA kernel launch A with 4471 blocks of 256 threads
==PROF== Profiling "vectorAdd_A" - 0: 0%....50%....100% - 46 passes
CUDA kernel launch B with 4471 blocks of 256 threads
==PROF== Profiling "vectorAdd_B" - 1: 0%....50%....100% - 46 passes
Copy output data from the CUDA device to the host memory
Done
==PROF== Disconnected from process 5268
==PROF== Report: profile.ncu-rep
```

2. Customizing data collection

Options are available to specify for which kernels data should be collected. -c limits the number of kernel launches collected. -s skips the given number of kernels before data collection starts. -k allows you to filter the kernels by a regex match of their names. --kernel-id allows you to filter kernels by context, stream, name and invocation, similar to nvprof.

To limit what should be collected for each kernel launch, specify the exact *.section (files) by their identifier using --section. Each section file defines a set of metrics to be collected, grouped logically to solve a specific performance question. By default, the sections associated with the basic set are collected. Use --list-sets to see the list of currently available sets. Use --list-sections to see the list of currently available sections. The default search directory and location of pre-defined section files is also called sections/. See the Profiling Guide for more details.

Alternatively, you can collect a set of individual metrics using **--metrics**. The available metrics can be queried using **--query-metrics**. For an explanation of the naming conventions and structuring of metrics, see Metrics Structure.

Most metrics in NVIDIA Nsight Compute are named using a base name and various suffixes, e.g. $sm_throughput.avg.pct_of_peak_sustained_elapsed$. The base name is $sm_throughput$ and the suffix is $avg.pct_of_peak_sustained_elapsed$. This is because most metrics follow the same structure and have the same set of suffixes. You need to pass the base or full name to NVIDIA Nsight Compute when selecting a metric for profiling. Use --query-metrics-mode suffix --metrics <metrics list> to see the full names for the chosen metrics.

Some additional metrics do not follow this structured naming. They are documented in the Metrics Reference.

3. Changing command line output

By default, a temporary file is used to store profiling results, and data is printed to the command line. To permanently store the profiler report, use **-o** to specify the output filename.

Besides storing results in a report file, the command line profiler can print results using different pages. Those pages correspond to the respective pages in the UI's report. By default, the Details page is printed, if no explicit output file is specified. To select a different page or print in addition to storing in an explicit file, use the --page=<Page> command. Currently, the following pages are supported: details, raw, source.

Use **--csv** to make any output comma separated and easier to process further. See Console Output for further options, e.g. summary views.

4. Open the report in the UI

The UI executable is called ncu-ui. A shortcut with this name is located in the base directory of the NVIDIA Nsight Compute installation. The actual executable is located in the folder host\windows-desktop-win7-x64 on Windows or host/linux-desktop-glibc_2_11_3-x64 on Linux. In the UI window, close the Connection dialog and open the report file through File > Open, by dragging the report file into NVIDIA Nsight Compute.

You can also specify the report file as a command line parameter to the executable, i.e. as ncu-ui <MyReport.ncu-rep>. Alternatively, when using NVIDIA Nsight Compute CLI on a platform with host support, --open-in-ui can be used directly with ncu to open a collected report in the user interface.

The report opens in a new document window. For more information about the report, see the Profiler Report for collecting profile information through NVIDIA Nsight Compute.

Chapter 3. USAGE

3.1. Modes

Modes change the fundamental behavior of the command line profiler. Depending on which mode is chosen, different Command Line Options become available. For example, Launch is invalid if the *Attach* mode is selected.

- Launch-and-attach: The target application is launched on the local system with the tool's injection libraries. Depending on which profiling options are chosen, selected kernels in the application are profiled and the results printed to the console or stored in a report file. The tool exits once the target application finishes or crashes, and once all results are processed.
 - This is the default, and the only mode that supports profiling of child processes on selected platforms.
- Launch: The target application is launched on the local system with the tool's injection libraries. As soon as the first intercepted API call is reached (commonly cuInit()), all application threads are suspended. The application now expects a tool to attach for profiling. You can attach using NVIDIA Nsight Compute or using the command line profiler's *Attach* mode.
- ▶ **Attach:** The tool tries to connect to a target application previously launched using NVIDIA Nsight Compute or using the command line profiler's *Launch* mode. The tool can attach to a target on the local system or using a remote connection.

3.2. Multi-Process Support

NVIDIA Nsight Compute CLI supports profiling multi-process applications on the following platforms: x86_64 Windows, x86_64 Linux, DRIVE OS Linux, DRIVE OS QNX, PowerPC. See the Launch options on how to enable this feature.

On x86_64 Windows, NVIDIA Nsight Compute CLI supports profiling 64-bit processes launched from 32-bit applications by default . On x86_64 Linux, launching from 32-bit applications requires you to enable the **support-32bit** option, and the required 32-bit

libraries must be installed on your system. On DRIVE OS Linux, DRIVE OS QNX and PowerPC, tracking of 32-bit applications is not supported. *Profiling* of 32-bit processes is not supported on any platform.

Profiling MPI applications is a special case of multi-process profiling.

NVIDIA Nsight Compute CLI can be used to profile applications launched with the **mpirun** command.

To profile all ranks on a node and store all the profiling data in a single report file:

```
ncu --target-processes all -o <report-name> mpirun [mpi arguments] <app>
    [app arguments]
```

► To profile multi-node submissions, one instance of NVIDIA Nsight Compute CLI can be used per node. Ensure that you specify unique report files per rank.

```
mpirun [mpi arguments] ncu -o report_%q{OMPI_COMM_WORLD_RANK} <app> [app
    arguments]
```

► To profile a single rank one can use a wrapper script. The following script (called "wrap.sh") profiles rank 0 only:

```
#!/bin/bash
if [[ $OMPI_COMM_WORLD_RANK == 0 ]]; then
    ncu -o report_${OMPI_COMM_WORLD_RANK} --target-processes all "$@"
else
    "$@"
fi
```

and then execute:

```
mpirun [mpi arguments] ./wrap.sh <app> [app arguments]
```

3.3. Output Pages

The command line profiler supports printing results to the console using various pages. Each page has an equivalent in NVIDIA Nsight Compute's *Profiler Report*. In the command line profiler, they are slightly adapted to fit console output. To select a page, use the **--page** option. By default, the details page is used. Note that if **--page** is not used but **--export** is, no results will be printed to the console.

▶ **Details:** This page represents NVIDIA Nsight Compute's *Details* page. For every profiled kernel launch, each collected is printed as section as a three-column table, followed by any rule results applied to this section. Rule results not associated with any section are printed after the kernel's sections.

The first section table column shows the metric name. If the metric was given a label in the section, it is used instead. The second column shows the metric unit, if available. The third column shows the unit value. Both metric unit and value are automatically adjusted to the most fitting order of magnitude. By default, only

metrics defined in section headers are shown. This can be changed by passing the -- details-all option on the command line.

Some metrics will show multiple values, separated by ";", e.g. memory_l2_transactions_global Kbytes 240; 240; 240; 240; 240. Those are instanced metrics, which have one value per represented instance. An instance can be a streaming multiprocessor, an assembly source line, etc.

▶ Raw: This page represents NVIDIA Nsight Compute's *Raw* page. For every profiled kernel launch, each collected metric is printed as a three-column table. Besides metrics from sections, this includes automatically collected metrics such as device attributes and kernel launch information.

The first column shows the metric name. The second and third columns show the metric unit and value, respectively. Both metric unit and value are automatically adjusted to the most fitting order of magnitude. No unresolved regex:, group:, or breakdown: metrics are included.

3.4. Profile Import

Using the **--import** option, saved reports can be imported into the command line profiler. When using this flag, most other options are not available, except for certain result filterting options. They are marked as such in the Profile options table.

3.5. Metrics and Units

When available and applicable, metrics are shown along with their unit. This is to make it apparent if a metric represents cycles, threads, bytes/s, and so on.

By default, units are scaled automatically so that metric values are shown with a reasonable order of magnitude. Units are scaled using their SI-factors, i.e. byte-based units are scaled using a factor of 1000 and the prefixes K, M, G, etc. Time-based units are also scaled using a factor of 1000, with the prefixes n, u and m. This scaling can be changed using a command line option, see Console Output options for details.

3.6. NVTX Filtering

--nvtx-include <configuration> --nvtx-exclude <configuration>

These options are used to profile only those kernels which satisfy the conditions mentioned in the configuration. Through these options, you can choose which kernel falls into a specific range or collection of ranges.

You can use both options multiple times, mentioning all the --nvtx-include configurations followed by all --nvtx-exclude configurations. NVTX filtering requires --nvtx option.

NVTX ranges are of two types: NvtxRangeStart/End and NvtxRangePush/Pop. The configuration syntax for both the types are briefly described below.

Start-End Ranges

| Quantifier | Description | Example |
|------------|---|--|
| , | Delimiter between range names | Range A,Range B Range B,Range A,Range C |
| @ | Specify domain name. If not mentioned, assuming <default domain=""></default> | Domain A@Range A Domain B@Range B,Range Z |

```
ncu --nvtx --nvtx-include "Domain A@Range A" CuNvtx.exe
```

The kernels wrapped inside 'Range A' of 'Domain A' in the application are profiled.

```
ncu --nvtx --nvtx-include "Range A, Range B" CuNvtx.exe
```

The kernels wrapped inside both ranges, 'Range A' and 'Range B' of '<default domain>' in the application are profiled.

```
ncu --nvtx --nvtx-include "Range A" --nvtx-include "Range B" CuNvtx.exe
```

The kernels wrapped inside ranges, 'Range A' or 'Range B' of '<default domain>' in the application are profiled.

```
ncu --nvtx --nvtx-exclude "Range A" CuNvtx.exe
```

All the kernels in the application are profiled except those which are wrapped inside 'Range A' of '<default domain>'.

```
ncu --nvtx --nvtx-include "Range B"--nvtx-exclude "Range A" CuNvtx.exe
```

The kernels wrapped inside only 'Range B' and not 'Range A' of '<default domain>' in the application are profiled.

Push-Pop Ranges

| Quantifier | Description | Example |
|------------|-------------------------------------|-------------------|
| 1 | Delimiter between range names | Range A/Range B |
| | | Range A/*/Range B |
| | | Range A/ |
| [| Range is at the bottom of the stack | [Range A |

| Quantifier | Description | Example |
|------------|---|---|
| | | [Range A/+/Range Z |
|] | Range is at the top of the stack | Range Z] |
| | | Range C/*/Range Z] |
| + | Only one range between the two other ranges | Range B/+/Range D |
| * | Zero or more range(s) between the two other ranges | Range B/*/Range Z |
| @ | Specify domain name. If not mentioned, assuming <default domain=""></default> | Domain A@Range A Domain B@Range A/*/Range Z] |

```
ncu --nvtx --nvtx-include "Domain A@Range A/" CuNvtx.exe
```

The kernels wrapped inside 'Range A' of 'Domain A' in the application are profiled.

```
ncu --nvtx --nvtx-include "[Range A" CuNvtx.exe
```

The kernels wrapped inside 'Range A' of '<default domain>' where 'Range A' is at the bottom of the stack in the application are profiled.

```
ncu --nvtx --nvtx-include "Range A/*/Range B" CuNvtx.exe
```

The kernels wrapped inside 'Range A' and 'Range B' of '<default domain>' with zero or many ranges between them in the application are profiled.

```
ncu --nvtx --nvtx-exclude "Range A/*/Range B" CuNvtx.exe
```

All the kernels in the application are profiled except those which are wrapped inside 'Range A' and 'Range B' of '<default domain>' with zero or many ranges between them.

```
ncu --nvtx --nvtx-include "Range A/" --nvtx-exclude "Range B]" CuNvtx.exe
```

The kernels wrapped inside only 'Range A' of '<default domain>' but not inside 'Range B' at the top of the stack in the application are profiled.

Regular Expression Support

The configuration syntax for both the types NvtxRangeStart/End and NvtxRangePush/Pop is the same. Additionally, to use regular expressions, follow the following syntax.

Provide prefix 'regex:' to treat nvtx config as regular expression.

```
ncu --nvtx --nvtx-include "regex:Domain[A-Z]@Range[0-9]/" CuNvtx.exe
```

The kernels wrapped inside push/pop range with matching regex 'Range[0-9]' of domain with matching regex 'Domain[A-Z]' are profiled.

Provide '/' as a prefix to "[" or "]" only for the range part of the config if "[" or "]" is at the start or at the end of the range part, respectively. This is needed so that NCU can distinguish if "[" or "]" is part of the regex or represents the top/bottom of the stack.

```
ncu --nvtx --nvtx-include "regex:[0-9]domainA@/[0-9]rangeA,RangeC[0-9/]"
CuNvtx.exe
```

The kernels wrapped inside start/end ranges with matching regex '[0-9]rangeA' and 'RangeC[0-9]' of domain with matching regex '[0-9]domainA' are profiled.

► If any quantifier is part of the domain/range name, you need to use '\\' or '\' as a prefix. For the "\$" quantifier, only the '\\' prefix is valid.

Additional Information

```
--nvtx-include DomainA@RangeA,DomainB@RangeB //Not a valid config
```

In a single NVTX configuration, multiple ranges with regard to a single domain can be specified. Mentioning ranges from different domains inside a single NVTX config is not supported.

```
--nvtx-include "Range A\[i\]"
```

Quantifiers '@' ',' '[' ']' '/' '+' can be used in range names using prefix '\'. The kernels wrapped inside 'Range A[i]' of '<default domain>' in the application are profiled.

```
--nvtx-include "Range A" //Start/End configuration
--nvtx-inlcude "Range A/" //Push/Pop configuration
--nvtx-inlcude "Range A]" //Push/Pop configuration
```

If the domain/range name contains '\', you need to provide '\\\' in the config.

Do not use '\\\' before any quantifier.

Including/Excluding only single range for Push/Pop configuration without specifying stack frame position '[' or ']', use '/' quantifier at the end.

```
--nvtx-include "Range A/*/RangeB"
```

The order in which you mention Push/Pop configurations is important. In the above example, 'Range A' should be below 'Range B' in the stack of ranges so that the kernel is profiled.

NVTX filtering honors cudaProfilerStart() and cudaProfilerStop(). There is no support for ranges with no name.

3.7. Config File

Using the **--config-file on/off** option, parsing parameters from config file can be enabled or disabled.

Using the **--config-file-path <path>** option, default path and name of config file can be overwritten.

By default, config-file with name config.ncu-cfg is searched in the current working directory, \$HOME/.config/NVIDIA Corporation on Linux and %APPDATA%\NVIDIA Corporation\ on Windows. If a valid config file is found, ncu parses the file and initializes any command line parameters to the values set in the file. If the same command line parameter is also set explicitly during the current invocation, the latter takes precedence.

Parameters can be set under various general modes and ncu command line parameters are used to determine which general-mode needs to be parsed from the config file. See the table below for more details.

| Command line parameters | General Mode |
|--|-------------------|
| ncumode launch-and-attach CuVectorAddMulti.exe | Launch-and-attach |
| ncumode launch CuVectorAddMulti.exe | Launch |
| ncumode attach | Attach |
| nculist-sets, nculist-sections, nculist-rules and nculist-metrics | List |
| ncuquery-metrics | Query |
| ncu -i <myreport.ncu-rep></myreport.ncu-rep> | Import |

These general modes should be defined in the config file using INI-like syntax as:

[<general-mode>]
<parameter>=<value>
;<comments>

Sample usage

```
[Launch-and-attach]
-c = 1
--section = LaunchStats, Occupancy
[Import]
--open-in-ui
-c = 1
--section = LaunchStats, Occupancy
```

From this configuration, ncu will parse parameters set under [Launch-and-attach] block whenever an application is profiled in launch-and-attach mode. In the same manner, parameters set under [Import] block will be parsed whenever a report is imported. Different modes can be clubbed together if there exists a set of parameters which is common to each mode. Sample shown above can be rewritten after clubbing both modes as:

```
[Launch-and-attach, import]
-c = 1
--section = LaunchStats, Occupancy
[Import]
--open-in-ui
```

Additional points

- Options like --open-in-ui do not expect any value to be set. These options should not be passed any value.
- Options like --section can be passed multiple times in the command line. These options should be written only once under a general-mode with all required values seperated by comma as shown below. Explicitly setting values for these options will not overwrite the config file values. Instead, all values will be composed together and set to the option.

```
[<general-mode>]
<parameter>=<value1>,<value2>,...
```

Chapter 4. COMMAND LINE OPTIONS

For long command line options, passing a unique initial substring can be sufficient.

4.1. General

Table 1 General Command Line Options

| Option | Description | Default |
|-----------------|--|-------------------|
| h,help | Show help message | |
| v,version | Show version information | |
| mode | Select the mode of interaction with the target application | launch-and-attach |
| | launch-and-attach: Launch the target application and immediately attach for profiling. launch: Launch the target application and suspend in the first intercepted API call, wait for tool to attach. attach: Attach to a previously launched application to which no other tool is attached. | |
| p,port | Base port used for connecting to target applications formode launch/attach | 49152 |
| max-connections | Maximum number of ports for connecting to target applications | 64 |
| config-file | Use config.ncu-cfg config file to set parameters. Searches in the current working directory, in "\$HOME/.config/NVIDIA Corporation" on Linux and in | on |

| Option | Description | Default |
|------------------|---|---------|
| | "%APPDATA%\NVIDIA Corporation\" on Windows. | |
| config-file-path | Override the default path for config file. | |

4.2. Launch

Table 2 Launch Command Line Options

| Option | Description | Default |
|-------------------------|---|--|
| check-exit-code | Check the application exit code and print an error if it is different than 0. If set, replay-mode application will stop after the first pass if the exit code is not 0. | yes |
| injection-path-64 | Override the default path for the injection libraries. The injection libraries are used by the tools to intercept relevant APIs (like CUDA or NVTX). | |
| preload-library | Prepend a shared library to be loaded by the application before the injection libraries. This option can be given multiple times and the libraries will be loaded in the order they were specified. | |
| call-stack | Enable CPU Call Stack collection. | false |
| nvtx | Enable NVTX support for tools. | false |
| target-processes | Select the processes you want to profile. Available modes are: • application-only Profile only the root application process. • all Profile the application and all its child processes. | all |
| target-processes-filter | Set the comma separated expressions to filter which processes are profiled. Process name> Set the exact process name to include for profiling. Pregex: <expression> Set the regex to include matching process names for profiling. On shells</expression> | Examples target-processes-filter MatrixMul.exe Include all processes having executable name exactly as "MatrixMul.exe". target-processes-filter regex:MatrixInclude all processes that include the string "Matrix" in their executable |

| Option | Description | Default |
|---------------|---|---|
| | that recognize regular expression symbols as special characters (e.g. Linux bash), the expression needs to be escaped with quotes, e.gtarget- processes-filter regex:".*Process". When using regex:, the expression must not include any commas. exclude: <process name=""> Set the exact process name to exclude for profiling. exclude-tree:<process name=""> Set the exact process name to exclude for profiling and further process tracking. None of its child processes will be profiled, even if they match a positive filter. This option is not available on Windows. The executable name part of the process will be considered in the match. Processing of filters stops at the first match. If any positive</process></process> | name, e.g. "MatrixMul" and "MatrixAdd". target-processes-filter MatrixMul, MatrixAddInclude all processes having executable name exactly as "MatrixMul" or "MatrixAdd". target-processes-filter exclude:MatrixMul.exe Exclude only "MatrixMul.exe". target-processes- filter exclude- tree:ChildLauncher, ParentPr "ChildLauncher" and all its sub-processes. Include (only) "ParentProcess", but not if it's a child of "ChildLauncher". |
| | filter is specified, no process that is not matching a positive filter is profiled. | |
| support-32bit | Support profiling processes launched from 32-bit applications. This option is only available on x86_64 Linux. On Windows, tracking 32-bit applications is enabled by default. | no |
| null-stdin | Launch the application with '/ dev/null' as its standard input. This avoids applications reading from standard input being stopped by SIGTTIN signals and hanging when running as backgrounded processes. | false |

4.3. Attach

Table 3 Attach Command Line Options

| Option | Description | Default |
|----------|---|-----------|
| hostname | Set the hostname or IP address for connecting to the machine on which the target application is running. When attaching to a local target application, use 127.0.0.1. | 127.0.0.1 |

4.4. Profile

Table 4 Profile Command Line Options

| Option | Description | Default/Examples |
|-------------|--|--|
| devices | List the GPU devices to enable profiling on, separated by comma. 1 | All devices Examplesdevices 0,2 |
| filter-mode | Set the filtering mode for kernel launches. Available modes: • global: Apply provided launch filters on kernel launches collectively. • per-gpu: Apply provided launch filters on kernel launches separately on each device. Effective launch filters for this mode arelaunch-count andlaunch-skip • per-launch-config: Apply kernel filters and launch filters on kernel launches separately for each GPU launch parameter i.e. Grid Size, Block Size and Shared Memory. | global |
| kernel-id | Set the identifier to use for matching kernels. If the kernel does not match the identifier, it will be ignored for profiling. | Exampleskernel-id ::foo:2 For kernel "foo", match the second invocation. |

This filtering option is available when using --import.

| Option | Description | Default/Examples |
|---------------|--|--|
| | The identifier must be of the following format: context-id:stream-id: [name-operator:]kernel-name:invocation-nr Context-id is the CUDA context ID or regular expression to match the NVTX name. Stream-id is the CUDA stream ID or regular expression to match the NVTX name. Iname-operator is an optional operator to kernel-name. Currently, only regex is the only supported operator. Kernel-name is the expression to match the kernel name. By default, this is a full, literal match to what is specified by kernel-name-base. When specifying the optional regex name operator, this is a partial regular expression match to what is specified bykernel-name-base. invocation-nr is the N'th invocation of this kernel function. Multiple invocations can also be specified using regular expressions. If the context/stream ID is a positive number, it will be strictly matched against the CUDA context/stream ID. Otherwise it will be treated as a regular expression and matched against the context/stream name specified using the NVTX library. | kernel-id :::".*5 3" For all kernels, match the third invocation, and all for which the invocation number ends in "5". kernel-id ::regex:^.*foo \$: Match all kernels ending in "foo". kernel-id ::regex:^(?! foo): Match all kernels except those starting with "foo". Note that depending on your OS and shell, you might need to quote the expression, e.g. using single quotes in Linux bash:kernel-id ::regex:'^(?!foo)': kernel-id 1:2::7 Match all seventh kernel invocations on context 1, stream 2. |
| k,kernel-name | Set the expression to use when matching kernel names. <pre></pre> | Examples -k foo Match all kernels named exactly "foo". -k regex:foo Match all kernels that include the string "foo", e.g. "foo" and "fooBar". -k regex:"foo bar" Match all kernels including the strings "foo" |

| Option | Description | Default/Examples |
|--------------------------|--|--|
| | as special characters (e.g. Linux bash), the expression needs to be escaped with quotes, e.gkernel-name regex:".*Foo". | or "bar", e.g. "foo", "foobar", "_bar2". |
| | If the kernel name or the provided expression do not match, it will be ignored for profiling. 1 | |
| kernel-name-base | Set the basis forkernel- name, andkernel-id kernel- name. Options are: | function |
| | function: Function name without parameters, templates etc. e.g. dmatrixmul demangled: Demangled function name, including parameters, templates, etc. e.g. dmatrixmul (float*,int,i) mangled: Mangled function name. e.gZ10dmatrixmulPfiis_iis_ | |
| c,launch-count | Limit the number of profiled kernel launches. The count is only incremented for launches that match the kernel filters. 1 | |
| s,launch-skip | Set the number of kernel launches to skip before starting to profile kernels. The number takes into account only launches that match the kernel filters. 1 | 0 |
| launch-skip-before-match | Set the number of kernel launches to skip before starting to profile. The count is incremented for all launches, regardless of the kernel filters. 1 | 0 |
| range-filter | Filter to profile specified instance(s) of matching NVTX ranges or start/stop ranges created through cu(da)ProfilerStart/Stop APIs. | Examplesrange-filter :2:3 nvtx-include A/ Match 2nd start/stop range and also 3rd NVTX push/pop range A in the |
| | Specify in format [yes/no/ on/off]:[start/stop range instance(s)]:[NVTX range instance(s)] | app. range-filter yes:2:3 nvtx-include A/ Match 3rd NVTX push/pop range A from 2nd |
| | [yes/no/on/off]: default is 'no/off'. If set to 'yes/on' then NVTX range numbering | start/stop range. |

| Option | Description | Default/Examples |
|-------------|---|------------------|
| | starts from 1 inside every start/stop range. Provide numbers in regex form e.g, [2-4] or 2 3 4 to profile 2nd, 3rd and 4th instance of the matching range. NVTX range numbers will be counted for matching range provided usingnvtx-include. | |
| kill | Terminate the target application when the requestedlaunch-count was profiled. Allowed values: on/off yes/no | no |
| replay-mode | Mechanism used for replaying a kernel launch multiple times to collect all requested profiling data: • kernel: Replay individual kernel launches "transparently" during the execution of the application. See Kernel Replay for more details. • application: Relaunch the entire application multiple times. Requires deterministic program execution. See Application Replay for more details. • range: Replay ranges of CUDA API calls and kernel launches "transparently" during the execution of the application. Ranges must be defined using cu (da) ProfilerStart/ stop API pairs or NVTX expressions. See Range Replay for more details. • app-range: Profile ranges without API capture by relaunching the entire application multiple times. Requires deterministic program execution. Ranges must be defined using cu (da) ProfilerStart/ Stop API pairs or NVTX expressions. See Application | kernel |

| Option | Description | Default/Examples |
|-------------------|---|------------------|
| | Range Replay for more details. | |
| app-replay-buffer | Application replay buffer location. • file: Replay pass data is buffered in a temporary file. The report is created after profiling completed. This mode is more scalable, as the amount of required memory does not scale with the number of profiled kernels. • memory: Replay pass data is buffered in memory, and the report is created while profiling. This mode can result in better performance if the filesystem is slow, but the amount of required | file |
| app-replay-match | memory scales with the number of profiled kernels. Application replay kernel matching strategy. For all options, kernels are matched on a per-process and per-device (GPU) basis. Below options are used to configure the applied strategy in more detail. | grid |
| | name: Kernels are matched in the following order: 1. (mangled) name, 2. order of execution grid: Kernels are matched in the following order: 1. (mangled) name, 2. CUDA grid/block size, 3. order of execution all: Kernels are matched in the following order: 1. (mangled) name, 2. CUDA grid/block size, 3. CUDA context ID, 4. CUDA stream ID, 5. order of execution | |
| app-replay-mode | Application replay kernel matching mode: strict: Requires all kernels to match across all replay passes. relaxed: Produces results only for kernels that could | strict |

| Option | Description | Default/Examples |
|----------------------|---|--|
| | be matched across replay passes. | |
| range-replay-options | Range replay options, separated by comma. Below options are supported: | none |
| | ► enable-greedy-sync | |
| | Insert ctx sync for applicable deferred APIs during capture. b disable-host-restore | |
| | Disable restoring device- written host allocations. | |
| graph-profiling | CUDA graph profiling mode: | node |
| | ► node | |
| | Profile individual kernel nodes as regular CUDA kernels. • graph | |
| | Profile entire graphs as one workload (but disable profiling of individual graph kernel nodes). See the Kernel Profiling Guide for more information on this mode. | |
| list-sets | List all section sets found in the searched section folders and exit. For each set, the associated sections are shown, as well as the estimated number of metrics collected as part of this set. This number can be used as an estimate of the relative profiling overhead per kernel launch of this set. | |
| set | Identifier of section set to collect. If not specified, the basic set is collected. The full set of sections can be collected withset full. | If noset option is given, the basic set is collected. If not specified andsection ormetrics are used, no sets are collected. Uselist-sets to see which set is the default. |
| list-sections | List all sections found in the searched section folders and exit. | |
| section | Add a section identifier to collect in one of the following ways: | If nosection options are given, the sections associated with the basic set are collected. If no sets are found, all sections are collected. |

| Option | Description | Default/Examples |
|--------------------------|---|---|
| | <pre>></pre> | |
| section-folder | orpage source. 1 Add a non-recursive search path for .section files. Section files in this folder will be made available to thesection option. | If nosection-folder options are given, the sections folder is added by default. |
| section-folder-recursive | Add a recursive search path for .section files. Section files in this folder and all folders below will be made available to the section option. | If nosection-folder options are given, the sections folder is added by default. |
| list-rules | List all rules found in the searched section folders and exit. | |
| apply-rules | Apply active and applicable rules to each profiling result. Userule to limit which rules to apply. Allowed values: • on/off • yes/no | yes |
| rule | Add a rule identifier to apply. Impliesapply-rules yes. | If norule options are given, all applicable rules in the sections folder are applied. |
| import-source | If available from -lineinfo, correlated CUDA source files are permanently imported into the report. Allowed values: • on/off • yes/no Usesource-folders option to provide missing source files. | no |
| source-folders | Add comma separated recursive search paths for missing CUDA | |

| Option | Description | Default/Examples |
|--------------------|---|------------------|
| | source files to import into the report. | |
| list-metrics | List all metrics collected from active sections. If the list of active sections is restricted using thesection option, only metrics from those sections will be listed. | |
| query-metrics | Query available metrics for the devices on system. Use devices andchips to filter which devices to query. Note that by default, listed metric names need to be appended a valid suffix in order for them to become valid metrics. See query-metrics-mode for how to get the list of valid suffixes, or check the Kernel Profiling Guide. | |
| query-metrics-mode | Set the mode for querying metrics. Impliesquery-metrics. Available modes: • base: Only the base names of the metrics. • suffix: Suffix names for the base metrics. This gives the list of all metrics derived from the base metrics. Usemetrics to specify the base metrics to query. • all: Full names for all metrics. This gives the list of all base metrics and their suffix metrics. | base |
| metrics | Specify all metrics to be profiled, separated by comma. If nosection options are given, only the temporary section containing all metrics listed using this option is collected. Ifsection options are given in addition tometrics, all metrics from those sections and frommetrics are collected. Names passed to this option support the following prefixes: - regex: <expression> expands to all metrics that partially match the expression. Enclose the</expression> | |

| Option | Description | Default/Examples |
|-----------------------------|---|---------------------------|
| Option | regular expression in ^\$ to force a full match. group: <name> lists all metrics of the metric group with that name. See section files for valid group names. breakdown:<metric> expands to the input metrics of the high-level throughput metric. If the specified metric does not support a breakdown, no metrics are added. pmsampling:<metric> collects the metric using PM sampling. Only single-pass metrics that don't require SASS-patching (_sass_) are supported. Using this prefix adds a timeline element to the report's details page.</metric></metric></name> | Default/Examples |
| | Combining multiple prefixes is not supported. If a metric requires a suffix to be valid, and neither regex: nor group: are used, this option automatically expands the name to all available first-level submetrics. | |
| | When importing a report, :group and :breakdown are not supported. When using regex:, the expression must not include any commas. | |
| list-chips | List all supported chips that can be used withchips. | |
| chips | Specify the chips for querying metrics, separated by comma. | Exampleschips gv100,tu102 |
| profile-from-start | Set if application should be profiled from its start. Allowed values: on/off yes/no | yes |
| disable-profiler-start-stop | Disable profiler start/ stop. When enabled, cu(da) ProfilerStart/Stop API calls are ignored. | |

| Option | Description | Default/Examples |
|---------------|--|------------------|
| quiet | Suppress all profiling output. | |
| verbose | Make profiler output more verbose. | |
| cache-control | Control the behavior of the GPU caches during profiling. Allowed values: all: All GPU caches are flushed before each kernel replay iteration during profiling. While metric values in the execution environment of the application might be slightly different without invalidating the caches, this mode offers the most reproducible metric results across the replay passes and also across multiple runs of the target application. none: No GPU caches are flushed during profiling. This can improve performance and better replicates the application behavior if only a single kernel replay pass is necessary for metric collection. However, some metric results will vary depending on prior GPU work, and between replay iterations. This can lead to inconsistent and out-of-bounds metric values. | all |
| clock-control | Control the behavior of the GPU clocks during profiling. Allowed values: • base: GPC and memory clocks are locked to their respective base frequency during profiling. This has no impact on thermal throttling. Note that actual clocks might still vary, depending on the level of driver support for this feature. As an alternative, use nvidia-smi to lock the clocks externally and set this option to none. | base |

| Option | Description | Default/Examples |
|--------------|--|------------------|
| | none: No GPC or memory frequencies are changed during profiling. reset: Reset GPC and memory clocks for all or the selected devices and exit. Use if a previous, killed execution of ncu left the GPU clocks in a locked state. | |
| nvtx-include | Adds an include statement to the NVTX filter, which allows selecting kernels to profile based on NVTX ranges. 1 | |
| nvtx-exclude | Adds an exclude statement to the NVTX filter, which allows selecting kernels to profile based on NVTX ranges. 1 | |

4.5. PM Sampling

These options apply to PM sampling. See here for options used in warp state sampling.

Table 5 PM Sampling Command Line Options

| Option | Description | Default |
|-------------------------|--|----------|
| pm-sampling-interval | Set the PM sampling interval in cycles or ns (depending on the architecture), or determine dynamically when 0. | 0 (auto) |
| pm-sampling-buffer-size | Set the size of the device-sided allocation for PM sampling in bytes, or determine dynamically when 0. | 0 (auto) |

4.6. Warp Sampling

These options apply to Warp State Sampling. See here for options used in PM sampling.

Table 6 Warp Sampling Command Line Options

| Option | Description | Default |
|------------------------|--|---------|
| warp-sampling-interval | Set the sampling period in the range of [031]. The actual frequency is 2 ^ (5 + value) cycles. If set to 'auto', the profiler tries to automatically | auto |

| Option | Description | Default |
|---------------------------|---|--------------|
| | determine a high sampling frequency without skipping samples or overflowing the output buffer. | |
| warp-sampling-max-passes | Set maximum number of passes used for sampling (see the Kernel Profiling Guide for more details on profiling overhead). | 5 |
| warp-sampling-buffer-size | Set the size of the device-sided allocation for samples in bytes. | 32*1024*1024 |

4.7. File

Table 7 File Command Line Options

| Option | Description | Default |
|------------------------|--|---|
| log-file | Send all tool output to the specified file, or one of the standard channels. The file will be overwritten. If the file doesn't exist, a new one will be created. "stdout" as the whole file name indicates standard output channel (stdout). "stderr" as the whole file name indicates standard error channel (stderr)." | Iflog-file is not set, profile results will be printed on the console. |
| o,export | Set the output file for writing the profile report. If not set, a temporary file will be used which is removed afterwards. The specified name supports macro expansion. See File Macros for more details. | Ifexport is set and no page option is given, no profile results will be printed on the console. |
| f,force-overwrite | Force overwriting all output files. | By default, the profiler won't overwrite existing output files and show an error instead. |
| i,import | Set the input file for reading the profile results. | |
| open-in-ui | Open report in UI instead of showing result on terminal. (Only available on host platforms) | |
| section-folder-restore | Restores stock files to the default section folder or the folder specified by an accompanyingsection-folder option. If the operation will overwrite modified files then theforce-overwrite option is required. | |

4.8. Console Output

Table 8 Console Output Command Line Options

| Option | Description | Default |
|--------------|--|--|
| CSV | Use comma-separated values as console output. Impliesprint-units base by default. | |
| page | Select the report page to print console output for. Available pages are: • details Show results grouped as sections, include rule results. Some metrics that are collected by default (e.g. device attributes) are omitted if not specified explicitly in any section or using metrics. • raw Show all collected metrics by kernel launch. • source Show source. See print-source to select the source view. • session Show launch settings, session info, process info and device attributes. | details. If nopage option is given andexport is set, no results are printed to the console output. |
| print-source | Select the source view: sass Show SASS (assembly) instructions for each kernel launch. ptx Show PTX source of every cubin whose at least one kernel is profiled. cuda Show entire CUDA-C source file which has kernel code as per kernel launch. CLI shows CUDA source only if file exists on the host machine. cuda,sass Show SASS CUDA-C source correlation for each kernel launch. CLI shows CUDA source only if file exists on the host machine. Metric correlation with source is available in sass, and cuda,sass | sass |

| Option | Description | Default |
|------------------------|---|-----------|
| | source view. Metrics specified withmetrics and specified section file withsection are correlated. Consider restricting the number of selected metrics such that values fit into a single output row. | |
| resolve-source-file | Resolve CUDA source file in thepage source output. Provide comma separated files full path. | |
| print-details | Select which part of a section should be shown in the details page output: • header Show all metrics from header of the section. • body Show all metrics from body of the section. • all Show all metrics from the section. Replaces deprecated option details-all. | header |
| print-metric-name | Select one of the option to show it in the Metric Name column: • label Show metric label. • name Show metric name. • label-name Show both metric label and metric name. | label |
| print-units | Select the mode for scaling of metric units. Available modes are: • auto Show all metrics automatically scaled to the most fitting order of magnitude. • base Show all metrics in their base unit. | auto |
| print-fp | Show all numeric metrics in the console output as floating point numbers. | false |
| print-kernel-base | Set the basis for kernel name output. Seekernel-regexbase for options. | demangled |
| print-metric-instances | Set output mode for metrics with instance values: • none Only show GPU aggregate value. | none |

| Option | Description | Default |
|--------------------|--|---------|
| | values Show GPU aggregate followed by all instance values. | |
| print-nvtx-rename | Select how NVTX should be used for renaming: • none Don't use NVTX for renaming. • kernel Rename kernels with the most recent enclosing NVTX push/pop range. | none |
| print-rule-details | Print additional details for rule results, such as the triggering metrics. Currently has no effect in CSV mode. | false |
| print-summary | Select the summary output mode. Available modes are: • none No summary. • per-gpu Summary for each GPU. • per-kernel Summary for each kernel type. • per-nvtx Summary for each NVTX context. | none |

4.9. Response File

Response files can be specified by adding <code>@FileName</code> to the command line. The file name must immediately follow the <code>@</code> character. The content of each response file is inserted in place of the corresponding response file option.

4.10. File Macros

The file name specified with option -o or --export supports the following macro expansions. Occurrences of these macros in the report file name are replaced by the corresponding character sequence. If not specified otherwise, the macros cannot be used as part of the file path.

Table 9 Macro Expansions

| Macro | Description |
|--------------|---|
| %h | Expands to the host name of the machine on which the command line profiler is running. |
| %q{ENV_NAME} | Expands to the content of the variable with the given name ENV_NAME from the environment of the command line profiler. |

| Macro | Description |
|-------|---|
| %p | Expands to the process ID of the command line profiler. |
| %i | Expands to the lowest unused positive integer number that guarantees the resulting file name is not yet used. This macro can only be used once in the output file name. |
| %% | Expands to a single % character in the output file name. This macro can be used in the file path and the file name. |

Chapter 5. ENVIRONMENT VARIABLES

The following environment variables can be set before launching NVIDIA Nsight Compute CLI, or the UI, respectively.

Table 10 Environment Variables

| Name | Description | Default/Values |
|------------------------------|--|--|
| NV_COMPUTE_PROFILER_DISABLE_ | TRANE HITE DEPLOYMENT to the versioned sections directory, using section and rule files from the stock directory within the installation instead. | Default: unset Set to "1" to disable deployment. |
| | By default, the versioned directory from the user's documents folder is used to ensure that any potential user updates are taken into account. | |
| | Only supported in the NVIDIA Nsight Compute CLI. | |
| NV_COMPUTE_PROFILER_LOCAL_C | connection mechanism between frontend and profiled target processes. The default mechanism is platform- dependent. This should only be used if there are connection problems between frontend and target processes in a local launch. | Default: unset (use default mechanism) Set to "uds" to use Unix Domain Socket connections (available on Posix platforms, only). Set to "tcp" to use TCP (available on all platforms). Set to "named-pipes" to use Windows Named Pipes (available on Windows, only). |
| NV_COMPUTE_PROFILER_DISABLE_ | Software (SW) metric pre- pass. When collecting SW- patched metrics, such as inst_executed, the pre-pass is used to determine which functions are executed as part of the kernel and should be patched. This requires a | Default: unset (use pre-pass when applicable) Set to "1" to disable pre-pass. |

| Name | Description | Default/Values |
|------------------------------|--|--|
| | separate replay pass, and if only instruction-level SW metrics are to be collected, prevents single-pass data collection. Disabling the pre-pass can improve performance if memory save-and-restore is undesirable and application replay is not possible. | |
| NV_COMPUTE_PROFILER_DISABLE_ | Tisable Editext switch trace during PM sampling. | Default: unset (enable context switch trace) |
| | | Set to "1" to disable context switch trace. |

Chapter 6. NVPROF TRANSITION GUIDE

This guide provides tips for moving from nvprof to NVIDIA Nsight Compute CLI. NVIDIA Nsight Compute CLI tries to provide as much feature and usage parity as possible with nvprof, but some features are now covered by different tools and some command line options have changed their name or meaning.

6.1. Trace

▶ GPU and API trace

NVIDIA Nsight Compute CLI does not support any form of tracing GPU or API activities. This functionality is covered by NVIDIA Nsight Systems.

6.2. Metric Collection

Finding available metrics

For nvprof, you can use **--query-metrics** to see the list of metrics available for the current devices on your machine. You can also use **--devices** to filter which local devices to query. For NVIDIA Nsight Compute CLI, this functionality is the same. However, in addition, you can combine **--query-metrics** with **--chip** [chipname] to query the available metrics for any chip, not only the ones in your present CUDA devices.

Note that metric names have changed between nvprof and NVIDIA Nsight Compute CLI and metric names also differ between chips after (and including) GV100 and those before. See Metric Comparison for a comparison of nvprof and NVIDIA Nsight Compute metric names.

On Volta and newer GPUs, most metrics are named using a base name and various suffixes, e.g. $sm_throughput.avg.pct_of_peak_sustained_elapsed$. The base name is $sm_throughput$ and the suffix is $avg.pct_of_peak_sustained_elapsed$. This is because most metrics follow the same structure and have the same set of suffixes. You need to pass the full name to NVIDIA Nsight Compute when selecting a metric for profiling.

To reduce the number of metrics shown for Volta and newer GPUs when using --query-metrics, by default only the base names are shown. Use --query-metrics-mode suffix --metrics <metrics list> to see the full names for the chosen metrics. Use --query-metrics-mode all to see all metrics with their full name directly.

Selecting which metrics to collect

In both nvprof and NVIDIA Nsight Compute CLI, you can specify a commaseparated list of metric names to the --metrics option. While nvprof would allow you to collect either a list or all metrics, in NVIDIA Nsight Compute CLI you can use regular expressions to select a more fine-granular subset of all available metrics. For example, you can use --metrics "regex:.*" to collect all metrics, or --metrics "regex:smsp_cycles_elapsed" to collect all "smsp_cycles_elapsed" metrics.

Selecting which events to collect

You cannot collect any events in NVIDIA Nsight Compute CLI.

Selecting which section to collect

In nvprof, you can either collect individual metrics or events, or a pre-configured set (all, analysis-metrics). NVIDIA Nsight Compute CLI adds the concept of a *section*. A section is a file that describes which metrics to collect for which GPU architecture, or architecture range. Furthermore, it defines how those metrics will be shown in both the command line output or the user interface. This includes structuring in tables, charts, histograms etc.

NVIDIA Nsight Compute CLI comes with a set of pre-defined sections, located in the **sections** directory. You can inspect, modify or extend those, as well as add new ones, e.g. to easily collect recurring metric sets. Each section specifies a unique *section identifier*, and there must not be two sections with the same identifier in the search path.

By default, the sections associated with the basic section set are collected. You can select one or more individual sections using the --section [section identifier] option one or more times. If no --section option is given, but --metrics is used, no sections will be collected.

Selecting which section set to collect

In nvprof, you can either collect individual metrics or events, or a pre-configured set (all, analysis-metrics). NVIDIA Nsight Compute CLI adds the concept of *section sets*. A section set defines a group of sections to collect together, in order to achieve different profiling overheads, depending on the required analysis level of detail.

If no other options are selected, the basic section set is collected. You can select one or more sets using the --set [set identifier] option one or more times. If no --set option is given, but --section or --metrics is used, no sets will be collected.

6.3. Metric Comparison

NVIDIA Nsight Compute uses two groups of metrics, depending on which GPU architecture is profiled. For nvprof metrics, the following table lists the equivalent metrics in NVIDIA Nsight Compute, if available. For a detailed explanation of the structuring of PerfWorks metrics, see Metrics Structure.

Metrics starting with sm_ are collected per-SM. Metrics starting with smsp_ are collected per-SM subpartition. However, all corresponding nvprof events are collected per-SM, only. Check the Metrics Guide for more details on these terms.

Table 11 Metrics Mapping Table from CUPTI to PerfWorks

| nvprof Metric | PerfWorks Metric or Formula (>= SM 7.0) |
|---------------------------------|---|
| achieved_occupancy | sm_warps_active.avg.pct_of_peak_sustained_active |
| atomic_transactions | l1tex_t_set_accesses_pipe_lsu_mem_global_op_atom.sum + l1tex_t_set_accesses_pipe_lsu_mem_global_op_red.sum |
| atomic_transactions_per_request | (l1tex_t_sectors_pipe_lsu_mem_global_op_atom.sum + l1tex_t_sectors_pipe_lsu_mem_global_op_red.sum) / (l1tex_t_requests_pipe_lsu_mem_global_op_atom.sum + l1tex_t_requests_pipe_lsu_mem_global_op_red.sum) |
| branch_efficiency | smsp_sass_average_branch_targets_threads_uniform.pct |
| cf_executed | smspinst_executed_pipe_cbu.sum + smspinst_executed_pipe_adu.sum |
| cf_fu_utilization | n/a |
| cf_issued | n/a |
| double_precision_fu_utilization | smsp_inst_executed_pipe_fp64.avg.pct_of_peak_sustained_active |
| dram_read_bytes | dram_bytes_read.sum |
| dram_read_throughput | dram_bytes_read.sum.per_second |
| dram_read_transactions | dram_sectors_read.sum |
| dram_utilization | dram_throughput.avg.pct_of_peak_sustained_elapsed |
| dram_write_bytes | dram_bytes_write.sum |
| dram_write_throughput | dram_bytes_write.sum.per_second |
| dram_write_transactions | dram_sectors_write.sum |
| eligible_warps_per_cycle | smsp_warps_eligible.sum.per_cycle_active |
| flop_count_dp | smsp_sass_thread_inst_executed_op_dadd_pred_on.sum + smsp_sass_thread_inst_executed_op_dmul_pred_on.sum + smsp_sass_thread_inst_executed_op_dfma_pred_on.sum * 2 |
| flop_count_dp_add | smsp_sass_thread_inst_executed_op_dadd_pred_on.sum |
| flop_count_dp_fma | smsp_sass_thread_inst_executed_op_dfma_pred_on.sum |
| flop_count_dp_mul | smsp_sass_thread_inst_executed_op_dmul_pred_on.sum |
| flop_count_hp | smsp_sass_thread_inst_executed_op_hadd_pred_on.sum + smsp_sass_thread_inst_executed_op_hmul_pred_on.sum + smsp_sass_thread_inst_executed_op_hfma_pred_on.sum * 2 |
| flop_count_hp_add | smsp_sass_thread_inst_executed_op_hadd_pred_on.sum |

6.4. Event Comparison

For nvprof events, the following table lists the equivalent metrics in NVIDIA Nsight Compute, if available. For a detailed explanation of the structuring of PerfWorks metrics, see Metrics Structure.

Metrics starting with sm__ are collected per-SM. Metrics starting with smsp__ are collected per-SM subpartition. However, all corresponding nvprof events are collected per-SM, only. Check the Metrics Guide for more details on these terms.

Table 12 Events Mapping Table from CUPTI Events to PerfWorks Metrics for Compute Capability >= 7.0

6.5. Filtering

Filtering by kernel name

Both nvprof and NVIDIA Nsight Compute CLI support filtering which kernels' data should be collected. In nvprof, the option is <code>--kernels</code> and applies to following metric collection options. In NVIDIA Nsight Compute CLI, the option is named <code>--kernel-regex</code> and applies to the complete application execution. In other words, NVIDIA Nsight Compute CLI does not currently support collecting different metrics for different kernels, unless they execute on different GPU architectures.

Filtering by kernel ID

Nvprof allows users to specify which kernels to profile using a kernel ID description, using the same **--kernels** option. In NVIDIA Nsight Compute CLI, the syntax for this kernel ID is identical, but the option is named **--kernel-id**.

Filtering by device

Both nvprof and NVIDIA Nsight Compute CLI use --devices to filter the devices which to profile. In contrast to nvprof, in NVIDIA Nsight Compute CLI the option applies globally, not only to following options.

6.6. Output

API trace and summary

NVIDIA Nsight Compute CLI does not support any form of API-usage related output. No API data is captured during profiling.

Dependency analysis

NVIDIA Nsight Compute CLI does not support any dependency analysis. No API data is captured during profiling.

GPU trace

NVIDIA Nsight Compute CLI does not support any GPU trace output. Due to kernel replay during profiling, kernel executions are serialized, and start and end timestamps do not necessarily match those during application execution. In addition, no records for memory activities are recorded.

▶ Print summary

While nvprof has several command line options to specify which summary information to print, NVIDIA Nsight Compute CLI uses further arguments to the --print-summary options. Profiling data can be summarized per-gpu, per-kernel or per-nvtx context.

Kernel name demangling

Nvprof allows users to decide between name demangling on or off using the -demangling options. NVIDIA Nsight Compute CLI currently always demangles
kernel names in the output. In addition, the option --kernel-regex-base can be
used to decide which name format should be used when matching kernel names
during filtering.

Pages

Nvprof has no concept of output pages, all data is shown as a list or summarized. NVIDIA Nsight Compute CLI uses *pages* to define how data should be structured and printed. Those correspond to the report pages used in the GUI variant. The option <code>--page</code> can be used to select which page to show, and <code>details</code> is selected by default. All pages also support printing in CSV format for easier post-processing, using the <code>--csv</code> option.

6.7. Launch and Attach

Launching a process for profiling

In nvprof, the application to profile is passed to the tool as a command line argument. The application must be a local executable. Alternatively, you can choose to use the tool in a *daemon mode* and profile all applicable processes on the local machine (nvprof option --profile-all-processes). In nvprof, the decision to profile the complete process tree or only the root process is done via the --profile-child-processes flag. In NVIDIA Nsight Compute CLI, the --target-processes option is used for this.

NVIDIA Nsight Compute CLI has several modes to determine which application to collect data for. By default, the executable passed via the command line to the tool is started, connected to, and profiled. This mode is called **launch-and-attach**.

Launching a process for attach

In contrast to nvprof, you can choose to only launch a local executable. In this mode (--mode launch), the process is started, connected to, but then suspended at the

first CUDA API call. Subsequently, there is a third mode (--mode attach) to attach to any process launched using the aforementioned mode. In this case, all profiling and output options would be passed to the attaching instance of NVIDIA Nsight Compute CLI.

Remote profiling

Finally, using launch and attach, you can connect to a launched process on a remote machine, which could even run a different operating system than the local host. Use --hostname to select which remote host to connect to.
