Revision	Date	Description
32.41.1000	May 05, 2024	Initial release of this Release Notes version, This version introduces Changes and New Features and Bug Fixes.

2 Overview

Firmware which is added at the time of manufacturing, is used to run user programs on the device and can be thought of as the software that allows hardware to run. Embedded firmware is used to control the functions of various hardware devices and systems, much like a computer's operating system (OS) controls the function of software applications. Firmware may be written into read-only memory (ROM), erasable programmable read-only memory (EPROM) or flash memory.

NVIDIA BlueField-3 DPU provides innovative acceleration, security, and efficiency in every host. BlueField-3 data center infrastructure combines the power of the NVIDIA ConnectX®-6 Dx with programmable Arm® cores and hardware offloads for software-defined storage, networking, security, and management workloads.

NVIDIA BlueField-3 also delivers superior performance, security, and reduced TCO for cloud computing platforms, enabling organizations to efficiently build and operate virtualized, containerized, and bare-metal infrastructures at massive scale.

4.1 Unsupported Functionalities

As of firmware v32.38.1002, DPU NIC mode has been updated. To upgrade to firmware v32.38.1002:

1. Set mlxconfig to move to DPU mode (if not already there).

```
sudo mst start
sudo mlxconfig -d /dev/mst/<device> s INTERNAL_CPU_MODEL=1 INTERNAL_CPU_OFFLOAD_ENGINE=0
```

2. Power-cycle the host.
3. Flash the latest BFB file (v2.2.0).
4. Set mlxconfig.

```
sudo mst start
sudo mlxconfig -d /dev/mst/<device> s INTERNAL_CPU_MODEL=1 INTERNAL_CPU_OFFLOAD_ENGINE=1
```

5. Set EXP_ROM_UEFI_ARM_ENABLE = True (1).
   If EXP_ROM_UEFI_ARM_ENABLE = False (0), perform the following on the Arm/SoC side:

```
sudo mst start
sudo mlxconfig -d /dev/mst/<device> s EXP_ROM_UEFI_ARM_ENABLE =1
```

6. Power-cycle the host.

⚠ Firmware v32.38.1002 is not backward compatible with older BlueField software releases.

9 Release Notes History

9.1 Changes and New Feature History

Feature/Change	Description
32.40.1000	
Socket Direct Single netdev Mapped to Two PCIe Devices	Enabled Single Netdev mapping to two PCIe devices (Socket Direct). Now multiple devices (PFs) of the same port can be combined under a single netdev instance. Traffic is passed through different devices belonging to different NUMA sockets, thus saving cross-NUMA traffic and allowing apps running on the same netdev from different NUMAs to still feel a sense of proximity to the device and achieve improved performance. The netdev is destroyed once any of the PFs is removed. A proper configuration would utilize the correct close NUMA when working on a certain app/CPU. Currently, this capability is limited to PFs only, and up to two devices (sockets). To enable the feature, one must configure the same Socket Direct group (non zero) for both PFs through mlxconfig SD_GROUP.
ACL	Added support for egress ACL to the uplink by adding a new bit to the Set Flow Table Entry: allow_fdb_uplink_hairpin.
Port Rate Limiting	Added a new access register (PBWS) to set the port maximum bandwidth to a value between 95% to 100%.
mlxconfig	Added a new NVConfig parameter to force Congestion Control algorithm to be SW-DCQCN.
Bug Fixes	See *Bug Fixes in this Firmware Version* section.

Feature/Change	Description
32.39.2048	
FEC Configuration	Changed the default FEC configuration for the "Protocol Aware" and "Active DME Modules" (ETH cables). For the list of cable identifiers, see tables below.
NC-SI Channels	Added support for two passthrough channels on dual-port adapter cards.
Expansion ROM	Added a caching mechanism to improved expansion ROM performance and to avoid any slow boot occurrences when loading the expansion ROM driver.
Live Migration Support for Image Size above 4GB	Added support for image size above 4GB when performing a live migration by splitting the image to chunks.
Crypto Algorithms	Extended the role-based authentication to cover all crypto algorithms. Now the TLS. IPsec. MACsec. GCM, mem2mem, and NISP work when `nv_crypto_conf.crypto_policy = CRYPTO_POLICY_FIPS_LEVEL_2,` meaning all cryptographic engines can also work in wrapped mode and not only in plaintext mode.
DSCP (priority) of ACK Packets	Added the ability to configure the DSCP (priority) of ACK packets using the ROCE_ACCL access register.
Performance Improvements	Added support for large MTU for force loopback QPs to improve performance (using the `aes_xts_tweak_inc_64` parameter). This capability is enabled by mlxconfig LARGE_MTU_TWEAK_64 parameter.

Feature/Change	Description
32.39.2048	
DDR Poison: DDR Uncorrectable Error	When there is DDR poison (uncorrectable ECC error), firmware reports the health syndrome `ICM_FETCH_PCI_DATA_POISONED_ERR (0x14)`, and triggers the FLR on the the function causing this error. Due to this error, the DDR data is mostly corrupted therefore, the firmware blocks other operations on this function.
Live Firmware Patch	Added support for Live Firmware Patch.
Reserved mkey	Added new support for reserved mkey index range. When enabled, a range of mkey indexes is reserved for mkey by name use.
Admin Queue	Added support for admin queue in virtio device object.
Enhanced NIC Mode: GGA Modules	Enabled GGA modules for all working modes (except for RXP) when using Enhanced NIC Mode.
Bug Fixes	See *Bug Fixes in this Firmware Version* section.

To configure FEC or Speed that is different than the default, you must configure both sides.

The following are examples of when FEC detection capability is available:

- when a 25G SFP module is connected to card, it will support FEC detection in 25G
- when a 100G QSFP module is connected to a card, it will support FEC detection in 100G, but not in 50G or 25G

Feature/Change	Description
32.38.3056	
DPA Signing	Added support for customer-signed DPA application authentication.
Bug Fixes	See *Bug Fixes in this Firmware Version* section.

Feature/Change	Description
32.38.1002	
DOCA Programmable Congestion Control	This new capability enables the user to control the programmability of congestion control based on DOCA including APIs, libraries, reference applications and advanced features such as high availability.
Header Modification	Added support to the metadata `reg_c 8-11` (packet fields) for matching and modifying the header, and Advanced Steering Operation (ASO) actions.
Precision Time Protocol (PTP)	Added support for PTP on 200G port link speed. PTP uses an algorithm and method for synchronizing clocks on various devices across packet-based networks to provide sub-microsecond accuracy. NVIDIA Spectrum supports PTP in both one-step and two-step modes and can serve either as a boundary or a transparent clock.
INT Packets	Added support for forwarding INT packets to the user application for monitoring purposes by matching the BTH acknowledge request bit (bth_a).

Feature/Change	Description
32.38.1002	
Crypto Support (GCM algorithm)	Added crypto support (GCM algorithm) via the Memory-to-Memory offload (MMO) engine.
NC-SI, Strap Values	Implemented NVIDIA NC-SI OEM command `query_strap_options` (command 0x0, parameter 0x34).
mlxconfig	Implemented the following mlxconfig parameters related to the sideband interface enable/disable method: • PCIE_IN_BAND_VDM_DISABLE: When TRUE, the management processor will disable PCIe in-band VDM (MCTP over PCIe) interface. • PCIE_SMBUS_DISABLE: When TRUE, the management processor will disable SMBUS (embedded on the PCIe connector) interface. • RBT_DISABLE: When TRUE, the management processor will disable RBT interface. • PLDM_FW_UPDATE_DISABLE: When TRUE, PLDM FW update over PCIe and SMBUS are disabled. • HM_RDE_DISABLE: When TRUE, RDE over PCIe and SMBUS are disabled.
AES-XTS	Added the ability to increase the tweak for every block by (1<<64) instead of by 1 in AES-XTS.
DPA PROCESS ERROR	Added support for a new value for coredump_type field in DPA_PROCESS_COREDUMP, [FIRST_ERROR_THREAD_DUMP (1).].
Bug Fixes	See *Bug Fixes in this Firmware Version* section.

Feature/Change	Description
32.37.3012	
General	This is the initial firmware release of NVIDIA BlueField-3 SmartNICs.
Return DPU to 'out of factory' State	Enables the user to return DPU to 'out of factory' state. This capability provides an option to 're-use' the DPUs to allow easy switch of tenants in bare-metal by clearing all the DPU data, and then re-provision it.
1k Emulated virtio-blk Devices	The virtio-blk device presents a block device to the Virtual Machine and offers high performance due to a thin software stack. This version supports 1k emulated virtio-blk devices. A typical configuration for this capability is: • 4 virtio-blk PFs and 253 virtio-blk VFs on each PF or • 8 virtio-blk PFs and 126 virtio-blk VFs on each PF
Geneve	GENEVE hardware offload enables the traditional offloads to be performed on the encapsulated traffic. The data center operators can decouple the overlay network layer from the physical NIC performance, thus achieving native performance in the new network architecture.
Monitoring Cloud Guest RoCE Statistics on Cloud Provider	This new capability enables the VM to track and limit its Vport's activity. This is done using the new q_counters counter which enables aggregation of other Vport's from PF GVMI.
Linux Bridge Offload	Added a flow rule that enables offloading of multicast traffic by broadcasting it to multi-Flow-Table in FDB.
Selective Repeat	Selective repeat improves network utilization in case of a lossy fabric. This features is enabled by default.

Feature/Change	Description
32.37.3012	
Provisioning Flow	Provisioning flow enables the user to "clean" flash data, and reprogram the flash and and the NIC.
Dynamic VF MSIX Allocation	Added support for dynamic MSIX modification on a VF NVME device emulation. If a PF NVME device emulation is created with `dynamic_vf_msix_control = 1`, then the `dynamic_vf_msix_reset` can set the PF device emulation's VF MSIX number to 0. The num_msix is used in the modified VF device emulation to modify the MSIX number of the VF device emulation.
InfiniBand Congestion Control (IB CC)	Enabled IB CC per Service Level (SL) for RC/UC on the HCA side. Now different SLs can be configured to be CC on/off according to the bitmask decided by the software.
Hardware Steering: Bulk Allocation	Added support for 32 actions in the header modify pattern using bulk allocation.
InfiniBand Congestion Control - RTT Response Service Level	The software can explicitly set the SL of an RTT response packet, instead of it being taken from the RTT request packet's SL. The RTT response packet SL may be set/queried via the `CONGESTION_CONTROL_HCA_NP_PARAMETER` MAD.
PCC Algorithms	Enables a smooth and statically switch between PCC algorithms. In addition, the user can now switch between PCC algorithms while running traffic.
IPSEC Side Acceleration with DPDK	**[Beta]** Added support for crypto (GCM) via the MMO engine.
AES-XTS	Added the ability to increase the tweak for every AES-XTS block by (1<<64) instead of by 1.
