Version	Date	Description
28.39.1002	November 07, 2023	Initial release of this Release Notes version, This version introduces Changes and New Features and Bug Fixes.

Overview

Firmware which is added at the time of manufacturing, is used to run user programs on the device and can be thought of as the software that allows hardware to run. Embedded firmware is used to control the functions of various hardware devices and systems, much like a computer's operating system (OS) controls the function of software applications. Firmware may be written into read-only memory (ROM), erasable programmable read-only memory (EPROM) or flash memory.

The ConnectX-7 smart host channel adapter (HCA) provides up to four ports of connectivity and 400Gb/s of throughput, hardware-accelerated networking, storage, security, and manageability services at data center scale for cloud, telecommunications, AI, and enterprise workloads. ConnectX-7 empowers agile and high-performance networking solutions with features such as Accelerated Switching and Packet Processing (ASAP2), advanced RoCE, GPUDirect Storage, and in-line hardware acceleration for Transport Layer Security (TLS), IP Security (IPsec), and MAC Security (MACsec) encryption and decryption. ConnectX-7 enables organizations to meet their current and future networking needs in both high-bandwidth and high-density environments.

The ConnectX-7 smart host channel adapter (HCA), featuring the NVIDIA Quantum-2 InfiniBand architecture, provides the highest networking performance available to take on the world's most challenging workloads. ConnectX-7 provides ultra-low latency, 400Gb/s throughput, and innovative NVIDIA In-Network Computing acceleration engines to provide additional acceleration to deliver the scalability and feature-rich technology needed for supercomputers, artificial intelligence, and hyperscale cloud data centers.

Changes and New Features

⚠ This firmware (with a new GPIO configuration) improves long-term ConnectX-7 reliability, and it is strongly desired that all customer upgrade to this version.

Changes and New Feature in this Firmware Version

Feature/Change	Description
28.39.1002	
NC-SI Channels	Added support for two passthrough channels on dual-port adapter cards.
Expansion ROM	Added a caching mechanism to improved expansion ROM performance and to avoid any slow boot occurrences when loading the expansion ROM driver.
Live Migration Support for Image Size above 4GB	Added support for image size above 4GB when performing a live migration by splitting the image to chunks.
Crypto Algorithms	Extended the role-based authentication to cover all crypto algorithms. Now the TLS. IPsec. MACsec. GCM, mem2mem, and NISP work when `nv_crypto_conf.crypto_policy = CRYPTO_POLICY_FIPS_LEVEL_2`, meaning all cryptographic engines can also work in wrapped mode and not only in plaintext mode.
DSCP (priority) of ACK Packets	Added the ability to configure the DSCP (priority) of ACK packets using the ROCE_ACCL access register.
Monitoring and Notification Mechanism for the Flash Interface	Added internal monitoring and external notification mechanism to detect over access to the flash interface and reduce access to it to avoid exceeding some hardware limitation on that interface. In extreme cases, if this mechanism is not sufficient, the user will be notified.
Reserved mkey	Added new support for reserved mkey index range. When enabled, a range of mkey indexes is reserved for mkey by name use.
Bug Fixes	See *Bug Fixes in this Firmware Version* section.

Changes and New Feature History

> ⚠️ This section includes history of changes and new feature of 3 major releases back. For older releases history, please refer to the relevant firmware versions.

> ⚠️ Firmware version 28.38.1900 (together with MLNX_OFED v23.07-0.5.1.2) should be used by InfiniBand customers.

Feature/Change	Description
28.38.1900	
QKEY Mitigation in the Kernel	QKEY creation with the MSB set is available now for non-privileged users as well. To allow non-privileged users to create QKEY with MSB set, the below new module parameter was added to ib_uverbs module: • **Module Parameter:** `enforce_qkey_check` • **Description:** Force QKEY MSB check for non-privileged user on UD QP creation • **Default:** 0 (disabled) **Note:** In this release, this module parameter is disabled by default to ensure backward compatibility and give customers the opportunity to update their applications accordingly. In the upcoming release, it will be enabled by default, and later on deprecated.

Feature/Change	Description
28.38.1002	
Header Modification	Added support to the metadata `reg_c 8-11` (packet fields) for matching and modifying the header, and Advanced Steering Operation (ASO) actions.
INT Packets	Added support for forwarding INT packets to the user application for monitoring purposes by matching the BTH acknowledge request bit (bth_a).
Get Electrical Sensor, NC-SI	Implemented NVIDIA NC-SI OEM Commands: • Get Electrical Sensor Count (command 0x13, parameter 0x6) • Gel Electrical Sensor (command 0x13, parameter 0x7) • Get Electrical Sensors (command 0x13, parameter 0x8)
IPsec CPS Bulk Allocation	Improved the IPsec CPS by using bulk allocation. For cases in which `log_obj_range == 0`, single IPSEC object will be allocated and initialized as before keeping backward compatibility. For better performance, it is recommended to work with IPsec bulk allocation and to initialize IPsec ASO context not via the firmware but via the hardware using ASO WQE.
DPA PROCESS ERROR	Added support for a new value for coredump_type field in DPA_PROCESS_COREDUMP, [FIRST_ERROR_THREAD_DUMP (1).].

Feature/Change	Description
28.38.1002	
Device Attestation	Attestation is a mechanism in which a host/platform automatically verifies the authenticity and integrity of the hardware and software state of a device. The mechanism is based on a HW RoT and utilizes SPDM messages that handle the attestation, measurement collection, and trust between device and platform BMC or platform RoT (usually host BMC). This provides the added value of increased security and assurance that the host/platform of device is not being tampered with and has the proper software running on it. A CoRIM is comprised of one or more CoMIDs, with each CoMID providing the reference claims about hardware and firmware for a device. The CoRIM and CoMIDs are encoded in CBOR format. Signed CoRIMs use COSE signatures. For further information, see "NVIDIA Device Attestation and CoRIM-based Reference Measurement Sharing".
QKEY Mitigation in the Kernel	Non-privileged users are now blocked by default from setting controlled/ privileged QKEYs (QKEY with MSB set).
Bug Fixes	See *Bug Fixes in this Firmware Version* section.

Feature/Change	Description
28.37.1014	
Mergeable Buffer	Added mergeable buffer support (VIRTIO_NET_F_MRG_RXBUF in virtio spec) for VDPA kernel mode to improve performance in case of large MTU such as 9K. The feature is disabled by default and must be manually enabled while creating or modifying the virtio device. **Note:** For best performance, it is <u>**NOT**</u> recommended to enable the feature if the VDPA MTU is set to the default value (1500).
Monitoring Cloud Guest RoCE Statistics on Cloud Provider	This new capability enables the VM to track and limit its Vport's activity. This is done using the new q_counters counter which enables aggregation of other Vport's from PF GVMI.
Linux Bridge Offload	Added a flow rule that enables offloading of multicast traffic by broadcasting it to multi-Flow-Table in FDB.
Selective Repeat	Selective repeat improves network utilization in case of a lossy fabric. This features is enabled by default.
Dynamic VF MSIX Allocation	Added support for dynamic MSIX modification on a VF NVME device emulation. If a PF NVME device emulation is created with `dynamic_vf_msix_control = 1`, then the `dynamic_vf_msix_reset` can set the PF device emulation's VF MSIX number to 0. The num_msix is used in the modified VF device emulation to modify the MSIX number of the VF device emulation.
InfiniBand Congestion Control (IB CC)	Enabled IB CC per Service Level (SL) for RC/UC on the HCA side. Now different SLs can be configured to be CC on/off according to the bitmask decided by the software.
ATS/ATC	Optimizes the ATC configuration dynamically based on the returned pages of the ATS translation requests that have been made.
PCC Algorithms	Enables a smooth and statically switch between PCC algorithms. In addition, the user can now switch between PCC algorithms while running traffic.

Feature/Change	Description
28.37.1014	
Hardware Steering: Bulk Allocation	Added support for 32 actions in the header modify pattern using bulk allocation.
InfiniBand Congestion Control - RTT Response Service Level	The software can explicitly set the SL of an RTT response packet, instead of it being taken from the RTT request packet's SL. The RTT response packet SL may be set/queried via the `CONGESTION_CONTROL_HCA_NP_PARAMETER` MAD.
