Chapter 1.
INTRODUCTION

NVRTC is a runtime compilation library for CUDA C++. It accepts CUDA C++ source code in character string form and creates handles that can be used to obtain the PTX. The PTX string generated by NVRTC can be loaded by cuModuleLoadData and cuModuleLoadDataEx, and linked with other modules by cuLinkAddData of the CUDA Driver API. This facility can often provide optimizations and performance not possible in a purely offline static compilation.

In the absence of NVRTC (or any runtime compilation support in CUDA), users needed to spawn a separate process to execute nvcc at runtime if they wished to implement runtime compilation in their applications or libraries, and, unfortunately, this approach has the following drawbacks:

- The compilation overhead tends to be higher than necessary, and
- End users are required to install nvcc and related tools which make it complicated to distribute applications that use runtime compilation.

NVRTC addresses these issues by providing a library interface that eliminates overhead associated with spawning separate processes, disk I/O, etc., while keeping application deployment simple.

Chapter 2.
GETTING STARTED

2.1. System Requirements

NVRTC requires the following system configuration:

- Operating System: Linux x86_64, Linux ppc64le, Linux aarch64, Windows x86_64, or Mac OS X.
- GPU: Any GPU with CUDA Compute Capability 2.0 or higher.
- CUDA Toolkit and Driver.

2.2. Installation

NVRTC is part of the CUDA Toolkit release and the components are organized as follows in the CUDA toolkit installation directory:

- On Windows:
  - include\nvrtc.h
  - bin\nvrtc64_Major Release VersionMinor Release Version.dll
  - bin\nvrtc-builtins64_Major Release VersionMinor Release Version.dll
  - lib\x64\nvrtc.lib
  - doc\pdf\NVRTC_User_Guide.pdf
- On Linux:
  - include/nvrtc.h
  - lib64/libnvrtc.so
  - lib64/libnvrtc-builtins.so

doc/pdf/NVRTC_User_Guide.pdf

On Mac OS X:

include/nvrtc.h
lib/libnvrtc.dylib
lib/libnvrtc-builtins.dylib

doc/pdf/NVRTC_User_Guide.pdf
Chapter 3.
USER INTERFACE

This chapter presents the API of NVRTC. Basic usage of the API is explained in Basic Usage.

‣ Error Handling
‣ General Information Query
‣ Compilation
‣ Supported Compile Options
‣ Host Helper

3.1. Error Handling

NVRTC defines the following enumeration type and function for API call error handling.

enum nvrtcResult

The enumerated type nvrtcResult defines API call result codes. NVRTC API functions return nvrtcResult to indicate the call result.

Values

NVRTC_SUCCESS = 0
NVRTC_ERROR_OUT_OF_MEMORY = 1
NVRTC_ERROR_PROGRAM_CREATION_FAILURE = 2
NVRTC_ERROR_INVALID_INPUT = 3
NVRTC_ERROR_INVALID_PROGRAM = 4
NVRTC_ERROR_INVALID_OPTION = 5
NVRTC_ERROR_COMPILATION = 6
NVRTC_ERROR_BUILTIN_OPERATION_FAILURE = 7
NVRTC_ERROR_NO_NAME_EXPRESSIONS_AFTER_COMPILATION = 8
NVRTC_ERROR_NO_LOWERED_NAMES_BEFORE_COMPILATION = 9
const char *nvrtcGetErrorString (nvrtcResult result)
	nvrtcGetErrorString is a helper function that returns a string describing the given
nvrtcResult code, e.g., NVRTC_SUCCESS to "NVRTC_SUCCESS". For unrecognized
enumeration values, it returns "NVRTC_ERROR unknown".

Parameters
result
CUDA Runtime Compilation API result code.

Returns
Message string for the given nvrtcResult code.

3.2. General Information Query

NVRTC defines the following function for general information query.

nvrtcResult nvrtcVersion (int *major, int *minor)
nvrtcVersion sets the output parameters major and minor with the CUDA Runtime
Compilation version number.

Parameters
major
CUDA Runtime Compilation major version number.
minor
CUDA Runtime Compilation minor version number.

Returns
- NVRTC_SUCCESS
- NVRTC_ERROR_INVALID_INPUT

3.3. Compilation

NVRTC defines the following type and functions for actual compilation.
typedef _nvrtcProgram *nvrtcProgram

nvrtcProgram is the unit of compilation, and an opaque handle for a program.

To compile a CUDA program string, an instance of nvrtcProgram must be created first with `nvrtcCreateProgram`, then compiled with `nvrtcCompileProgram`.

```c
nvrtcResult nvrtcAddNameExpression (nvrtcProgram prog, const char *name_expression)
```

`nvrtcAddNameExpression` notes the given name expression denoting the address of a `__global__` function or `__device__/__constant__` variable.

**Parameters**

- `prog` CUDA Runtime Compilation program.
- `name_expression` constant expression denoting the address of a `__global__` function or `__device__/__constant__` variable.

**Returns**

- `NVRTC_SUCCESS`
- `NVRTC_ERROR_NO_NAME_EXPRESSIONS_AFTER_COMPILATION`

**Description**

The identical name expression string must be provided on a subsequent call to `nvrtcGetLoweredName` to extract the lowered name.

**See also:**

`nvrtcGetLoweredName`

```c
nvrtcResult nvrtcCompileProgram (nvrtcProgram prog, int numOptions, const char **options)
```

`nvrtcCompileProgram` compiles the given program.

**Description**

It supports compile options listed in [Supported Compile Options](#).
nvrtcResult nvrtcCreateProgram (nvrtcProgram *prog, const char *src, const char *name, int numHeaders, const char **headers, const char **includeNames)

nvrtcCreateProgram creates an instance of nvrtcProgram with the given input parameters, and sets the output parameter prog with it.

Parameters
prog
  CUDA Runtime Compilation program.
src
  CUDA program source.
name
  CUDA program name. name can be NULL; "default_program" is used when name is NULL.
numHeaders
  Number of headers used. numHeaders must be greater than or equal to 0.
headers
  Sources of the headers. headers can be NULL when numHeaders is 0.
includeNames
  Name of each header by which they can be included in the CUDA program source. includeNames can be NULL when numHeaders is 0.

Returns

- NVRTC_SUCCESS
- NVRTC_ERROR_OUT_OF_MEMORY
- NVRTC_ERROR_PROGRAM_CREATION_FAILURE
- NVRTC_ERROR_INVALID_INPUT
- NVRTC_ERROR_INVALID_PROGRAM

Description

See also:

nvrtcDestroyProgram
nvrtcResult nvrtcDestroyProgram (nvrtcProgram *prog)
nvrtcDestroyProgram destroys the given program.

Parameters

prog
CUDA Runtime Compilation program.

Returns

- NVRTC_SUCCESS
- NVRTC_ERROR_INVALID_PROGRAM

Description

See also:

nvrtcCreateProgram

nvrtcResult nvrtcGetLoweredName (nvrtcProgram prog, const char *name_expression, const char **lowered_name)
nvrtcGetLoweredName extracts the lowered (mangled) name for a __global__ function or __device__/__constant__ variable, and updates *lowered_name to point to it. The memory containing the name is released when the NVRTC program is destroyed by nvrtcDestroyProgram. The identical name expression must have been previously provided to nvrtcAddNameExpression.

Parameters

prog
CUDA Runtime Compilation program.

name_expression
constant expression denoting the address of a __global__ function or __device__/__constant__ variable.

lowered_name
initialized by the function to point to a C string containing the lowered (mangled) name corresponding to the provided name expression.

Returns

- NVRTC_SUCCESS
- NVRTC_ERROR_NO_LOWERED_NAMES_BEFORE_COMPILATION
- NVRTC_ERROR_NAME_EXPRESSION_NOT_VALID
**Description**

See also:

nvrtcAddNameExpression

`nvrtcResult nvrtcGetProgramLog (nvrtcProgram prog, char *log)`

`nvrtcGetProgramLog` stores the log generated by the previous compilation of `prog` in the memory pointed by `log`.

**Parameters**

- `prog`  
  CUDA Runtime Compilation program.

- `log`  
  Compilation log.

**Returns**

- NVRTC_SUCCESS
- NVRTC_ERROR_INVALID_INPUT
- NVRTC_ERROR_INVALID_PROGRAM

**Description**

See also:

nvrtcGetProgramLogSize

`nvrtcResult nvrtcGetProgramLogSize (nvrtcProgram prog, size_t *logSizeRet)`

`nvrtcGetProgramLogSize` sets `logSizeRet` with the size of the log generated by the previous compilation of `prog` (including the trailing NULL).

**Parameters**

- `prog`  
  CUDA Runtime Compilation program.

- `logSizeRet`  
  Size of the compilation log (including the trailing NULL).
Returns

- NVRTC_SUCCESS
- NVRTC_ERROR_INVALID_INPUT
- NVRTC_ERROR_INVALID_PROGRAM

Description

Note that compilation log may be generated with warnings and informative messages, even when the compilation of `prog` succeeds.

See also:

nvrtcGetProgramLog

nvrtcResult nvrtcGetPTX (nvrtcProgram prog, char *ptx)

`nvrtcGetPTX` stores the PTX generated by the previous compilation of `prog` in the memory pointed by `ptx`.

Parameters

- `prog` CUDA Runtime Compilation program.
- `ptx` Compiled result.

Returns

- NVRTC_SUCCESS
- NVRTC_ERROR_INVALID_INPUT
- NVRTC_ERROR_INVALID_PROGRAM

Description

See also:

nvrtcGetPTXSize
nvrtcResult nvrtcGetPTXSize (nvrtcProgram prog, size_t *ptxSizeRet)

nvrtcGetPTXSize sets ptxSizeRet with the size of the PTX generated by the previous compilation of prog (including the trailing NULL).

Parameters

prog
  CUDA Runtime Compilation program.

ptxSizeRet
  Size of the generated PTX (including the trailing NULL).

Returns

‣ NVRTC_SUCCESS
‣ NVRTC_ERROR_INVALID_INPUT
‣ NVRTC_ERROR_INVALID_PROGRAM

Description

See also:

nvrtcGetPTX

3.4. Supported Compile Options

NVRTC supports the compile options below. Option names with two preceding dashes (--) are long option names and option names with one preceding dash (-) are short option names. Short option names can be used instead of long option names. When a compile option takes an argument, an assignment operator (=) is used to separate the compile option argument from the compile option name, e.g., "--gpu-architecture=compute_30". Alternatively, the compile option name and the argument can be specified in separate strings without an assignment operator, e.g., "--gpu-architecture" "compute_30". Single-character short option names, such as -D, -U, and -I, do not require an assignment operator, and the compile option name and the argument can be present in the same string with or without spaces between them. For instance, "-D=<def>"", "-D<def>"", and "-D <def>" are all supported.

The valid compiler options are:

‣ Compilation targets
 ‣ --gpu-architecture=<arch> (-arch)
Specify the name of the class of GPU architectures for which the input must be compiled.

- **Valid <arch>s:**
  - compute_30
  - compute_32
  - compute_35
  - compute_37
  - compute_50
  - compute_52
  - compute_53
  - compute_60
  - compute_61
  - compute_62
  - compute_70
  - compute_72
  - compute_75
- **Default:** compute_30

- **Separate compilation / whole-program compilation**
  - **--device-c (-dc)**
    Generate relocatable code that can be linked with other relocatable device code. It is equivalent to --relocatable-device-code=true.
  - **--device-w (-dw)**
    Generate non-relocatable code. It is equivalent to --relocatable-device-code=false.
  - **--relocatable-device-code={true|false} (-rdc)**
    Enable (disable) the generation of relocatable device code.
    - **Default:** false
  - **--extensible-whole-program (-ewp)**
    Do extensible whole program compilation of device code.
    - **Default:** false

- **Debugging support**
  - **--device-debug (-G)**
    Generate debug information.
  - **--generate-line-info (-lineinfo)**
    Generate line-number information.
Code generation

• **--maxrregcount=<N> (-maxrregcount)**

Specify the maximum amount of registers that GPU functions can use. Until a function-specific limit, a higher value will generally increase the performance of individual GPU threads that execute this function. However, because thread registers are allocated from a global register pool on each GPU, a higher value of this option will also reduce the maximum thread block size, thereby reducing the amount of thread parallelism. Hence, a good maxrregcount value is the result of a trade-off. If this option is not specified, then no maximum is assumed. Value less than the minimum registers required by ABI will be bumped up by the compiler to ABI minimum limit.

• **--ftz={true|false} (-ftz)**

When performing single-precision floating-point operations, flush denormal values to zero or preserve denormal values. --use_fast_math implies --ftz=true.

  ▶ Default: false

• **--prec-sqrt={true|false} (-prec-sqrt)**

For single-precision floating-point square root, use IEEE round-to-nearest mode or use a faster approximation. --use_fast_math implies --prec-sqrt=false.

  ▶ Default: true

• **--prec-div={true|false} (-prec-div)**

For single-precision floating-point division and reciprocals, use IEEE round-to-nearest mode or use a faster approximation. --use_fast_math implies --prec-div=false.

  ▶ Default: true

• **--fmad={true|false} (-fmad)**

Enables (disables) the contraction of floating-point multiplies and adds/subtracts into floating-point multiply-add operations (FMAD, FFMA, or DFMA). --use_fast_math implies --fmad=true.

  ▶ Default: true

• **--use_fast_math (-use_fast_math)**

Make use of fast math operations. --use_fast_math implies --ftz=true --prec-div=false --prec-sqrt=false --fmad=true.

  ▶ --extra-device-vectorization (-extra-device-vectorization)

Enables more aggressive device code vectorization in the NVVM optimizer.

• Preprocessing
- **--define-macro=<def>(-D)**

  `<def>` *can be either* `<name>` *or* `<name=definitions>`.

  - `<name>`
    
    Predefine `<name>` *as a macro with definition 1.*

  - `<name>=<definition>`
    
    The contents of `<definition>` *are tokenized and preprocessed as if they appeared during translation phase three in a #define directive. In particular, the definition will be truncated by embedded new line characters.*

- **--undefine-macro=<def>(-U)**

  Cancel any previous definition of `<def>`.

- **--include-path=<dir>(-I)**

  Add the directory `<dir>` *to the list of directories to be searched for headers. These paths are searched after the list of headers given to nvrTCCreateProgram.*

- **--pre-include=<header>(-include)**

  Preinclude `<header>` *during preprocessing.*

- **Language Dialect**

  - **--std={c++11|c++14|c++17}(--std={c++11|c++14|c++17})**

    Set language dialect to C++11, C++14 or C++17

  - **--builtin-move-forward={true|false}(--builtin-move-forward)**

    Provide builtin definitions of `std::move` and `std::forward`, when C++11 language dialect is selected.

    - **Default**: true

  - **--builtin-initializer-list={true|false}(--builtin-initializer-list)**

    Provide builtin definitions of `std::initializer_list` class and member functions when C++11 language dialect is selected.

    - **Default**: true

- **Misc.**

  - **--disable-warnings(--w)**

    Inhibit all warning messages.

  - **--restrict(--restrict)**

    Programmer assertion that all kernel pointer parameters are restrict pointers.

  - **--device-as-default-execution-space(--default-device)**
Treat entities with no execution space annotation as __device__ entities.

### 3.5. Host Helper

NVRTC defines the following functions for easier interaction with host code.

```cpp
template < typename T > nvrtcResult
nvrtcGetTypeName (std::string *result)
```

nvrtcGetTypeName stores the source level name of the template type argument T in the given std::string location.

**Parameters**

- `result`
  - pointer to std::string in which to store the type name.

**Returns**

- NVRTC_SUCCESS
- NVRTC_ERROR_INTERNAL_ERROR

**Description**

This function is only provided when the macro NVRTC_GET_TYPE_NAME is defined with a non-zero value. It uses abi::__cxa_demangle or UnDecorateSymbolName function calls to extract the type name, when using gcc/clang or cl.exe compilers, respectively. If the name extraction fails, it will return NVRTC_INTERNAL_ERROR, otherwise *result is initialized with the extracted name.
Unlike the offline nvcc compiler, NVRTC is meant for compiling only device CUDA C++ code. It does not accept host code or host compiler extensions in the input code, unless otherwise noted.

4.1. Execution Space

NVRTC uses __host__ as the default execution space, and it generates an error if it encounters any host code in the input. That is, if the input contains entities with explicit __host__ annotations or no execution space annotation, NVRTC will emit an error. __host__ __device__ functions are treated as device functions.

NVRTC provides a compile option, --device-as-default-execution-space, that enables an alternative compilation mode, in which entities with no execution space annotations are treated as __device__ entities.

4.2. Separate Compilation

NVRTC itself does not provide any linker. Users can, however, use cuLinkAddData in the CUDA Driver API to link the generated relocatable PTX code with other relocatable code. To generate relocatable PTX code, the compile option --relocatable-device-code=true or --device-c is required.

4.3. Dynamic Parallelism

NVRTC supports dynamic parallelism under the following conditions:

- Compilation target must be compute 35 or higher.
- Either separate compilation (--relocatable-device-code=true or --device-c) or extensible whole program compilation ( --extensible-whole-program ) must be enabled.
- Generated PTX must be linked against the CUDA device runtime (cudadevrt) library (see Separate Compilation).
Example: Dynamic Parallelism provides a simple example.

### 4.4. Integer Size

Different operating systems define integer type sizes differently. Linux x86_64 and Mac OS X implement LP64, and Windows x86_64 implements LLP64.

<table>
<thead>
<tr>
<th></th>
<th>short</th>
<th>int</th>
<th>long</th>
<th>long long</th>
<th>pointers and size_t</th>
</tr>
</thead>
<tbody>
<tr>
<td>LLP64</td>
<td>16</td>
<td>32</td>
<td>32</td>
<td>64</td>
<td>64</td>
</tr>
<tr>
<td>LP64</td>
<td>16</td>
<td>32</td>
<td>64</td>
<td>64</td>
<td>64</td>
</tr>
</tbody>
</table>

NVRTC implements LP64 on Linux and Mac OS X, and LLP64 on Windows.

### 4.5. Include Syntax

When `nvrtcCompileProgram()` is called, the current working directory is added to the header search path used for locating files included with the quoted syntax (e.g., `#include "foo.h"`), before the code is compiled.

### 4.7. Predefined Types

- `clock_t`
- `size_t`
- `ptrdiff_t`
- `va_list`: Note that the definition of this type may be different than the one selected by `nvcc` when compiling CUDA code.
- Predefined types such as `dim3`, `char4`, etc., that are available in the CUDA Runtime headers when compiling offline with `nvcc` are also available, unless otherwise noted.

### 4.8. Builtin Functions

Builtin functions provided by the CUDA Runtime headers when compiling offline with `nvcc` are available, unless otherwise noted.

### 4.6. NVRTC

The User guide to NVRTC.
This section of the document uses a simple example, Single-Precision $a \cdot X + Y$ (SAXPY), shown in Figure 1 to explain what is involved in runtime compilation with NVRTC. For brevity and readability, error checks on the API return values are not shown. The complete code listing is available in Example: SAXPY.

```c
const char *saxpy = "                                           
\n\nextern "C" __global__                                         
\nvoid saxpy(float a, float *x, float *y, float *out, size_t n)   
{                                                               
  size_t tid = blockIdx.x * blockDim.x + threadIdx.x;           
  if (tid < n) {                                                
    out[tid] = a * x[tid] + y[tid];                             
  }                                                             
}                                                               
";
```

**Figure 1** CUDA source string for SAXPY

First, an instance of `nvrtcProgram` needs to be created. Figure 2 shows creation of `nvrtcProgram` for SAXPY. As SAXPY does not require any header, 0 is passed as `numHeaders`, and `NULL` as `headers` and `includeNames`.

```c
const char *saxpy = "                                           
\n\nextern "C" __global__                                         
\nvoid saxpy(float a, float *x, float *y, float *out, size_t n)   
{                                                               
  size_t tid = blockIdx.x * blockDim.x + threadIdx.x;           
  if (tid < n) {                                                
    out[tid] = a * x[tid] + y[tid];                             
  }                                                             
}                                                               
";
```

**Figure 2** `nvrtcProgram` creation for SAXPY

If SAXPY had any `#include` directives, the contents of the files that are `#include`d can be passed as elements of headers, and their names as elements of `includeNames`. For example, `#include <foo.h>` and `#include <bar.h>` would require 2 as `numHeaders`, `"<contents of foo.h>"`, `"<contents of bar.h>"` as `headers`, and `{ "$foo.h", "$bar.h" }` as `includeNames` (<`contents of foo.h>` and `<contents of bar.h>`) must be replaced by the actual contents of `foo.h` and `bar.h`). Alternatively, the compile option `-I` can be used if the header is guaranteed to exist in the file system at runtime.

Once the instance of `nvrtcProgram` for compilation is created, it can be compiled by `nvrtcCompileProgram` as shown in Figure 3. Two compile options are used in this
example, `--gpu-architecture=compute_80` and `--fmad=false`, to generate code for the `compute_80` architecture and to disable the contraction of floating-point multiplies and adds/subtracts into floating-point multiply-add operations. Other combinations of compile options can be used as needed and Supported Compile Options lists valid compile options.

```c
const char *opts[] = {"--gpu-architecture=compute_80",
                     "--fmad=false"};

nvrtcCompileProgram(prog,     // prog
                    2,        // numOptions
                    opts);    // options
```

Figure 3  Compilation of SAXPY for compute_80 with FMAD enabled

After the compilation completes, users can obtain the program compilation log and the generated PTX as Figure 4 shows. NVRTC does not generate valid PTX when the compilation fails, and it may generate program compilation log even when the compilation succeeds if needed.

A `nvrtcProgram` can be compiled by `nvrtcCompileProgram` multiple times with different compile options, and users can only retrieve the PTX and the log generated by the last compilation.

```c
// Obtain compilation log from the program.
size_t logSize;
nvrtcGetProgramLogSize(prog, &logSize);
char *log = new char[logSize];
nvrtcGetProgramLog(prog, log);

// Obtain PTX from the program.
size_t ptxSize;
nvrtcGetPTXSize(prog, &ptxSize);
char *ptx = new char[ptxSize];
nvrtcGetPTX(prog, ptx);
```

Figure 4  Obtaining generated PTX and program compilation log

When the instance of `nvrtcProgram` is no longer needed, it can be destroyed by `nvrtcDestroyProgram` as shown in Figure 5.

```c
nvrtcDestroyProgram(&prog);
```

Figure 5  Destruction of nvrtcProgram
The generated PTX can be further manipulated by the CUDA Driver API for execution or linking. Figure 6 shows an example code sequence for execution of the generated PTX.

```c
CUdevice cuDevice;
CUcontext context;
CUmodule module;
CUfunction kernel;
cuInit(0);
cuDeviceGet(&cuDevice, 0);
cuCtxCreate(&context, 0, cuDevice);
cuModuleLoadDataEx(&module, ptx, 0, 0, 0);
cuModuleGetFunction(&kernel, module, "saxpy");
size_t n = size_t n = NUM_THREADS * NUM_BLOCKS;
size_t bufferSize = n * sizeof(float);
float a = ...;
float *hX = ..., *hY = ..., *hOut = ...;
CUdeviceptr dX, dY, dOut;
cuMemAlloc(&dX, bufferSize);
cuMemAlloc(&dY, bufferSize);
cuMemAlloc(&dOut, bufferSize);
cuMemcpyHtoD(dX, hX, bufferSize);
cuMemcpyHtoD(dY, hY, bufferSize);
void *args[] = { &a, &dX, &dY, &dOut, &n };
cuLaunchKernel(kernel,
    NUM_THREADS, 1, 1,   // grid dim
    NUM_BLOCKS, 1, 1,    // block dim
    0, NULL,             // shared mem and stream
    args,                // arguments
    0);
cuCtxSynchronize();
cuMemcpyDtoH(hOut, dOut, bufferSize);
```

Figure 6  Execution of SAXPY using the PTX generated by NVRTC
6.1. Introduction

NVRTC will mangle \texttt{__global__} function names and names of \texttt{__device__} and \texttt{__constant__} variables as specified by the IA64 ABI. If the generated PTX is being loaded using the CUDA Driver API, the kernel function or \texttt{__device__}/\texttt{__constant__} variable must be looked up by name, but this is hard to do when the name has been mangled. To address this problem, NVRTC provides API functions that map source level \texttt{__global__} function or \texttt{__device__}/\texttt{__constant__} variable names to the mangled names present in the generated PTX.

The two API functions \texttt{nvrtcAddNameExpression} and \texttt{nvrtcGetLoweredName} work together to provide this functionality. First, a 'name expression' string denoting the address for the \texttt{__global__} function or \texttt{__device__}/\texttt{__constant__} variable is provided to \texttt{nvrtcAddNameExpression}. Then, the program is compiled with \texttt{nvrtcCompileProgram}. During compilation, NVRTC will parse the name expression string as a C++ constant expression at the end of the user program. The constant expression must provide the address of the \texttt{__global__} function or \texttt{__device__}/\texttt{__constant__} variable. Finally, the function \texttt{nvrtcGetLoweredName} is called with the original name expression and it returns a pointer to the lowered name. The lowered name can be used to refer to the kernel or variable in the CUDA Driver API.

NVRTC guarantees that any \texttt{__global__} function or \texttt{__device__}/\texttt{__constant__} variable referenced in a call to \texttt{nvrtcAddNameExpression} will be present in the generated PTX (if the definition is available in the input source code).

6.2. Example

Example: Using Lowered Name lists a complete runnable example. Some relevant snippets:
1. The GPU source code ('gpu_program') contains definitions of various \_\_global\_ functions/function templates and \_\_device\_/\_\_constant\_ variables:

```
const char *gpu_program = "
__device__ int V1; // set from host code
static __global__ void f1(int *result) { *result = V1 + 10; }
namespace N1 {
    namespace N2 {
        __constant__ int V2; // set from host code
        __global__ void f2(int *result) { *result = V2 + 20; }
    }
}
```

```
template<typename T>
__global__ void f3(int *result) { *result = sizeof(T); }
```

2. The host source code invokes \texttt{nvrtcAddNameExpression} with various name expressions referring to the address of \_\_global\_ functions and \_\_device\_/\_\_constant\_ variables:

```
kernl_name_vec.push_back("\&f1");
... 
kernl_name_vec.push_back("N1::N2::f2");
... 
kernl_name_vec.push_back("f3<int>");
... 
kernl_name_vec.push_back("f3<double>");
```

```
// add name expressions to NVRTC. Note this must be done before 
// the program is compiled.
for (size_t i = 0; i < name_vec.size(); ++i)
    NVRTC_SAFE_CALL(nvrtcAddNameExpression(prog, kernel_name_vec[i].c_str()));
```

```
// add expressions for \_\_device\_/\_\_constant\_ variables to NVRTC 
variable_name_vec.push_back("\&V1");
... 
variable_name_vec.push_back("\&N1::N2::V2");
... 
for (size_t i = 0; i < variable_name_vec.size(); ++i)
    NVRTC_SAFE_CALL(nvrtcAddNameExpression(prog, 
                        variable_name_vec[i].c_str()));
```

3. The GPU program is then compiled with \texttt{nvrtcCompileProgram}. The generated PTX is loaded on the GPU. The mangled names of the \_\_device\_/\_\_constant\_ variables and \_\_global\_ functions are looked up:

```
// note: this call must be made after NVRTC program has been 
// compiled and before it has been destroyed.
NVRTC_SAFE_CALL(nvrtcGetLoweredName( 
    prog, 
    variable_name_vec[i].c_str(), // name expression 
    &name); // lowered name ));
```

```
NVRTC_SAFE_CALL(nvrtcGetLoweredName( 
    prog, 
    kernel_name_vec[i].c_str(), // name expression 
    &name)); // lowered name
```

4. The mangled name of the \_\_device\_/\_\_constant\_ variable is then used to lookup the variable in the module and update its value using the CUDA Driver API:

```
CUdeviceptr variable_addr;
CUDA_SAFE_CALL(cuModuleGetGlobal(&variable_addr, NULL, module, name));
CUDA_SAFE_CALL(cuMemcpyHtoD(variable_addr, 
    &initial_value, sizeof(initial_value));
```
5. The mangled name of the kernel is then used to launch it using the CUDA Driver API:

```c
CUfunction kernel;
CUDA_SAFE_CALL(cuModuleGetFunction(&kernel, module, name));
...
CUDA_SAFE_CALL(
  cuLaunchKernel(kernel,
  1, 1, 1, // grid dim
  1, 1, 1, // block dim
  0, NULL, // shared mem and stream
  args, 0));
```

6.3. Notes

1. Sequence of calls: All name expressions must be added using `nvrtcAddNameExpression` before the NVRTC program is compiled with `nvrtcCompileProgram`. This is required because the name expressions are parsed at the end of the user program, and may trigger template instantiations. The lowered names must be looked up by calling `nvrtcGetLoweredName` only after the NVRTC program has been compiled, and before it has been destroyed. The pointer returned by `nvrtcGetLoweredName` points to memory owned by NVRTC, and this memory is freed when the NVRTC program has been destroyed (`nvrtcDestroyProgram`). Thus the correct sequence of calls is:
   `nvrtcAddNameExpression, nvrtcCompileProgram, nvrtcGetLoweredName, nvrtcDestroyProgram`.

2. Identical Name Expressions: The name expression string passed to `nvrtcAddNameExpression` and `nvrtcGetLoweredName` must have identical characters. For example, "foo" and "foo " are not identical strings, even though semantically they refer to the same entity (foo), because the second string has an extra whitespace character.

3. Constant Expressions: The characters in the name expression string are parsed as a C++ constant expression at the end of the user program. Any errors during parsing will cause compilation failure and compiler diagnostics will be generated in the compilation log. The constant expression must refer to the address of a `__global__` function or `__device__/__constant__` variable.

4. Address of overloaded function: If the NVRTC source code has multiple overloaded `__global__` functions, then the name expression must use a cast operation to disambiguate. However, casts are not allowed in constant expression for C++ dialects before C++11. If using such name expressions, please compile the code in C++11 or later dialect using the `-std` command line flag. Example: Consider that the GPU code string contains:

```c
__global__ void foo(int) { }
__global__ void foo(char) { }
```

The name expression `(void(*)(int))foo` correctly disambiguates 'foo(int)', but the program must be compiled in C++11 or later dialect (e.g. `-std=c++11`) because casts are not allowed in pre-C++11 constant expressions.
Chapter 7.
INTERFACING WITH TEMPLATE HOST CODE

7.1. Introduction

In some scenarios, it is useful to instantiate __global__ function templates in device code based on template arguments in host code. The NVRTC helper function nvrtcGetTypeName can be used to extract the source level name of a type in host code, and this string can be used to instantiate a __global__ function template and get the mangled name of the instantiation using the nvrtcAddNameExpression and nvrtcGetLoweredName functions.

nvrtcGetTypeName is defined inline in the NVRTC header file, and is available when the macro NVRTC_GET_TYPE_NAME is defined with a non-zero value. It uses the abi::__cxa_demangle and UnDecorateSymbolName host code functions when using gcc/clang and cl.exe compilers, respectively. Users may need to specify additional header paths and libraries to find the host functions used (abi::__cxa_demangle / UnDecorateSymbolName). See the build instructions for the example below for reference (Build Instruction).

7.2. Example

Example: Using nvrtcGetTypeName lists a complete runnable example. Some relevant snippets:

1. The GPU source code ('gpu_program') contains definitions of a __global__ function template:

```cpp
const char *gpu_program = " \n\nnamespace N1 { struct S1_t { int i; double d; }; } \n\ntemplate<typename T> \n\n__global__ void f3(int *result) { *result = sizeof(T); } \n\n";
```

www.nvidia.com
NVRTC - CUDA Runtime Compilation

DU-07529-001 _vRelease Version | 24
2. The host code function `getKernelNameForType` creates the name expression for a `__global__` function template instantiation based on the host template type `T`. The name of the type `T` is extracted using `nvrtcGetTypeName`:

```cpp
template <typename T>
std::string getKernelNameForType(void)
{
    // Look up the source level name string for the type "T" using
    // nvrtcGetTypeName() and use it to create the kernel name
    std::string type_name;
    NVRTC_SAFE_CALL(nvrtcGetTypeName<T>(&type_name));
    return std::string("f3<") + type_name + ">";
}
```

3. The name expressions are presented to NVRTC using the `nvrtcAddNameExpression` function:

```cpp
name_vec.push_back(getKernelNameForType<int>());
.. name_vec.push_back(getKernelNameForType<double>());
.. name_vec.push_back(getKernelNameForType<N1::S1_t>());
.. for (size_t i = 0; i < name_vec.size(); ++i)
    NVRTC_SAFE_CALL(nvrtcAddNameExpression(prog, name_vec[i].c_str()));
```

4. The GPU program is then compiled with `nvrtcCompileProgram`. The generated PTX is loaded on the GPU. The mangled names of the `__global__` function template instantiations are looked up:

```cpp
// note: this call must be made after NVRTC program has been
// compiled and before it has been destroyed.
NVRTC_SAFE_CALL(nvrtcGetLoweredName(
    prog,
    name_vec[i].c_str(), // name expression
    &name // lowered name
));
```

5. The mangled name is then used to launch the kernel using the CUDA Driver API:

```cpp
CUfunction kernel;
CUDA_SAFE_CALL(cuModuleGetFunction(&kernel, module, name));
... CUDA_SAFE_CALL(
    cuLaunchKernel(kernel,
    1, 1, 1, // grid dim
    1, 1, 1, // block dim
    0, NULL, // shared mem and stream
    args, 0));
```
Chapter 8.
THREAD SAFETY

All NVRTC API functions are thread safe and may be invoked by multiple threads concurrently. However, due to implementation limitations, compilation is serialized if multiple threads attempt to compile CUDA code concurrently; compilation is done for a single thread at a time.
A.1. Code (saxpy.cpp)

```cpp
#include <nvrtc.h>
#include <cuda.h>
#include <iostream>

#define NUM_THREADS 128
#define NUM_BLOCKS 32
#define NVRTC_SAFE_CALL(x)
  do {
    nvrtcResult result = x;
    if (result != NVRTC_SUCCESS) {
      std::cerr << "error: " #x " failed with error "
                 << nvrtcGetErrorString(result) << '\n';
      exit(1);
    } while(0)
  }
#define CUDA_SAFE_CALL(x)
  do {
    CUresult result = x;
    if (result != CUDA_SUCCESS) {
      const char *msg;
      cuGetErrorName(result, &msg);
      std::cerr << "error: " #x " failed with error "
                 << msg << '\n';
      exit(1);
    } while(0)
  }

const char *saxpy = "
  extern "C" __global__
  void saxpy(float a, float *x, float *y, float *out, size_t n) {
    size_t tid = blockIdx.x * blockDim.x + threadIdx.x;
    if (tid < n) {
      out[tid] = a * x[tid] + y[tid];
    }
  }
  
int main() {
  // Create an instance of nvrtcProgram with the SAXPY code string.
  nvrtcProgram prog;
```

```cpp```
Example: SAXPY

```c
NVRTC_SAFE_CALL(  
nvrtcCreateProgram(&prog,       // prog  
saxpy,              // buffer  
"saxpy.cu",      // name  
0,           // numHeaders  
NULL,         // headers  
NULL));         // includeNames

// Compile the program with fmad disabled.  
// Note: Can specify GPU target architecture explicitly with '-arch' flag.  
const char *opts[] = {"--fmad=false"};  
nvrtcResult compileResult = nvrtcCompileProgram(prog,   // prog  
1,     // numOptions  
opts);  // options

// Obtain compilation log from the program.  
size_t logSize;  
NVRTC_SAFE_CALL(nvrtcGetProgramLogSize(prog, &logSize));  
char *log = new char[logSize];  
NVRTC_SAFE_CALL(nvrtcGetProgramLog(prog, log));  
std::cout << log << \n;  
delete[] log;  
if (compileResult != NVRTC_SUCCESS) {  
    exit(1);  
}

// Obtain PTX from the program.  
size_t ptxSize;  
NVRTC_SAFE_CALL(nvrtcGetPTXSize(prog, &ptxSize));  
char *ptx = new char[ptxSize];  
NVRTC_SAFE_CALL(nvrtcGetPTX(prog, ptx));  
// Destroy the program.  
NVRTC_SAFE_CALL(nvrtcDestroyProgram(&prog));  
// Load the generated PTX and get a handle to the SAXPY kernel.  
CUdevice cuDevice;  
CUcontext context;  
CUmodule module;  
CUfunction kernel;  
CUDA_SAFE_CALL(cuInit(0));  
CUDA_SAFE_CALL(cuDeviceGet(&cuDevice, 0));  
CUDA_SAFE_CALL(cuCtxCreate(&context, 0, cuDevice));  
CUDA_SAFE_CALL(cuModuleLoadDataEx(&module, ptx, 0, 0, 0));  
CUDA_SAFE_CALL(cuModuleGetFunction(&kernel, module, "saxpy"));  
// Generate input for execution, and create output buffers.  
size_t n = NUM_THREADS * NUM_BLOCKS;  
size_t bufferSize = n * sizeof(float);  
float a = 5.1f;  
float *hX = new float[n], *hY = new float[n], *hOut = new float[n];  
for (size_t i = 0; i < n; ++i) {  
    hX[i] = static_cast<float>(i);  
    hY[i] = static_cast<float>(i * 2);  
}  
CUdeviceptr dX, dY, dOut;  
CUDA_SAFE_CALL(cuMemAlloc(&dX, bufferSize));  
CUDA_SAFE_CALL(cuMemAlloc(&dY, bufferSize));  
CUDA_SAFE_CALL(cuMemAlloc(&dOut, bufferSize));  
CUDA_SAFE_CALL(cuMemcpyHtoD(dX, hX, bufferSize));  
CUDA_SAFE_CALL(cuMemcpyHtoD(dY, hY, bufferSize));  
// Execute SAXPY.  
void *args[] = { &a, &dX, &dY, &dOut, &n };  
CUDA_SAFE_CALL(  
cuParamBlock(kernel,  
    NUM_BLOCKS, 1, 1,     // grid dim  
    NUM_THREADS, 1, 1,    // block dim  
    0, NULL, // shared mem and stream  
    args, 0)); // arguments

CUDA_SAFE_CALL(cuCtxSynchronize());  
// Retrieve and print output.  
CUDA_SAFE_CALL(cuMemcpyDtoH(hOut, dOut, bufferSize));
```
for (size_t i = 0; i < n; ++i) {
    std::cout << a << " * " << hX[i] << " + " << hY[i] << " = " << hOut[i] << '\n';
}

// Release resources.
CUDA_SAFE_CALL(cuMemFree(dX));
CUDA_SAFE_CALL(cuMemFree(dY));
CUDA_SAFE_CALL(cuMemFree(dOut));
CUDA_SAFE_CALL(cuModuleUnload(module));
CUDA_SAFE_CALL(cuCtxDestroy(context));
delete[] hX;
delete[] hY;
delete[] hOut;
return 0;
}

A.2. Build Instruction

Assuming the environment variable CUDA_PATH points to CUDA Toolkit installation directory, build this example as:

- **Windows:**
  
  cl.exe saxpy.cpp /Fesaxpy ^
  /I "%CUDA_PATH%"\include ^
  "%CUDA_PATH%"\lib\x64\nvrtc.lib "%CUDA_PATH%"\lib\x64\cuda.lib

- **Linux:**
  
  g++ saxpy.cpp -o saxpy \
  -I $CUDA_PATH/include \ 
  -L $CUDA_PATH/lib64 \ 
  -lnvrtc -lcuda \ 
  -Wl,-rpath,$CUDA_PATH/lib64

- **Mac OS X:**
  
  clang++ saxpy.cpp -o saxpy \
  -I $CUDA_PATH/include \ 
  -L $CUDA_PATH/lib \ 
  -lnvrtc -framework CUDA \ 
  -Wl,-rpath,$CUDA_PATH/lib
Appendix B.
EXAMPLE: USING LOWERED NAME

B.1. Code (lowered-name.cpp)

```cpp
#include <nvrtc.h>
#include <cuda.h>
#include <iostream>
#include <vector>
#include <string>

#define NVRTC_SAFE_CALL(x)                                        
    do {                                                            
        nvrtcResult result = x;                                    
        if (result != NVRTC_SUCCESS) {                            
            std::cerr << "error: " #x " failed with error "        
                << nvrtcGetErrorString(result) << '\n';         
            exit(1);                                               
        }                                                          
    } while(0)

#define CUDA_SAFE_CALL(x)                                         
    do {                                                            
        CUresult result = x;                                       
        if (result != CUDA_SUCCESS) {                             
            const char *msg;                                       
            cuGetErrorName(result, &msg);                          
            std::cerr << "error: " #x " failed with error "        
                << msg << '
';                                
            exit(1);                                               
        }                                                          
    } while(0)

const char *gpu_program = "                                     
    __device__ int V1; // set from host code                      
    static __global__ void f1(int *result) { *result = V1 + 10; }  
namespace N1 {                                                  
    namespace N2 {                                                
        __constant__ int V2; // set from host code                
        __global__ void f2(int *result) { *result = V2 + 20; }    
    }                                                             
}                                                                  

template<typename T>                                            
__global__ void f3(int *result) { *result = sizeof(T); }         
```

```c
int main()
{

    // Create an instance of nvrtcProgram
    nvrtcProgram prog;
    NVRTC_SAFE_CALL(nvrtcCreateProgram(&prog, // prog 
                                           gpu_program, // buffer
                                           "prog.cu", // name
                                           0, // numHeaders
                                           NULL, // headers
                                           NULL)); // includeNames

    // add all name expressions for kernels
    std::vector<std::string> kernel_name_vec;
    std::vector<std::string> variable_name_vec;
    std::vector<int> variable_initial_value;
    std::vector<int> expected_result;

    // note the name expressions are parsed as constant expressions
    kernel_name_vec.push_back("&f1");
    expected_result.push_back(10 + 100);
    kernel_name_vec.push_back("N1::N2::f2");
    expected_result.push_back(20 + 200);
    kernel_name_vec.push_back("f3<int>");
    expected_result.push_back(sizeof(int));
    kernel_name_vec.push_back("f3<double>");
    expected_result.push_back(sizeof(double));

    // add kernel name expressions to NVRTC. Note this must be done before
    // the program is compiled.
    for (size_t i = 0; i < kernel_name_vec.size(); ++i)
        NVRTC_SAFE_CALL(nvrtcAddNameExpression(prog, kernel_name_vec[i].c_str()));

    // add expressions for __device__ / __constant__ variables to NVRTC
    variable_name_vec.push_back("&V1");
    variable_initial_value.push_back(100);
    variable_name_vec.push_back("&N1::N2::V2");
    variable_initial_value.push_back(200);

    for (size_t i = 0; i < variable_name_vec.size(); ++i)

  -I $CUDA_PATH/include \
  -L $CUDA_PATH/lib64 \
  -lnvrtc -lcuda \
  -L,$-rpath,$CUDA_PATH/lib64

- Mac OS X:
  clang++ lowered-name.cpp -o lowered-name \
  -I $CUDA_PATH/include \
  -L $CUDA_PATH/lib \
  -lnvrtc -framework CUDA \
  -L,$-rpath,$CUDA_PATH/lib
Appendix C.
EXAMPLE: USING NVRTCGETTYPENAME

C.1. Code (host-type-name.cpp)

```cpp
#include <nvrtc.h>
#include <cuda.h>
#include <iostream>
#include <vector>
#include <string>
#define NVRTC_SAFE_CALL(x) do { nvrtcResult result = x; if (result != NVRTC_SUCCESS) { std::cerr << "error: " #x " failed with error " << nvrtcGetErrorString(result) << '
'; exit(1); } } while(0)
#define CUDA_SAFE_CALL(x) do { CUresult result = x; if (result != CUDA_SUCCESS) { const char *msg; cuGetErrorName(result, &msg); std::cerr << "error: " #x " failed with error " << msg << '
'; exit(1); } } while(0)

const char *gpu_program = "
namespace N1 { struct S1_t { int i; double d; }; } 

template<typename T>
__global__ void f3(int *result) { *result = sizeof(T); }
```

// note: this structure is also defined in GPU code string. Should ideally be in a header file included by both GPU code string and by CPU code.

```cpp
namespace N1 { struct S1_t { int i; double d; }; }
```

```cpp
template <typename T>
std::string getKernelNameForType(void)
{
    // Look up the source level name string for the type "T" using
    // nvrtcGetTypeName() and use it to create the kernel name
    std::string type_name;
    NVRTC_SAFE_CALL(nvrtcGetTypeName<T>(&type_name));
    return std::string("f3<") + type_name + ">";
}

int main()
{
    // Create an instance of nvrtcProgram
    nvrtcProgram prog;
    NVRTC_SAFE_CALL(nvrtcCreateProgram(&prog,         // prog
                                          gpu_program,   // buffer
                                          "gpu_program.cu", // name
                                          0,             // numHeaders
                                          NULL,          // headers
                                          NULL));        // includeNames

    // add all name expressions for kernels
    std::vector<std::string> name_vec;
    std::vector<int> expected_result;

    // note the name expressions are parsed as constant expressions
    name_vec.push_back(getKernelNameForType<int>())
    expected_result.push_back(sizeof(int));

    name_vec.push_back(getKernelNameForType<double>())
    expected_result.push_back(sizeof(double));

    name_vec.push_back(getKernelNameForType<N1::S1_t>())
    expected_result.push_back(sizeof(N1::S1_t));

    // add name expressions to NVRTC. Note this must be done before
    // the program is compiled.
    for (size_t i = 0; i < name_vec.size(); ++i)
        NVRTC_SAFE_CALL(nvrtcAddNameExpression(prog, name_vec[i].c_str()));

    nvrtcResult compileResult = nvrtcCompileProgram(prog,  // prog
                                                   0,     // numOptions
                                                   NULL); // options

    // Obtain compilation log from the program.
    size_t logSize;
    NVRTC_SAFE_CALL(nvrtcGetProgramLogSize(prog, &logSize));
    char *log = new char[logSize];
    NVRTC_SAFE_CALL(nvrtcGetProgramLog(prog, log));
    std::cout << log << \n;
    delete[] log;
    if (compileResult != NVRTC_SUCCESS) {
        exit(1);
    }

    // Obtain PTX from the program.
    size_t ptxSize;
    NVRTC_SAFE_CALL(nvrtcGetPTXSize(prog, &ptxSize));
    char *ptx = new char[ptxSize];
    NVRTC_SAFE_CALL(nvrtcGetPTX(prog, ptx));
```
Example: Using nvrtcGetTypeName

// Load the generated PTX
CUdevice cuDevice;
CUcontext context;
CUmodule module;

CUDA_SAFE_CALL(cuInit(0));
CUDA_SAFE_CALL(cuDeviceGet(&cuDevice, 0));
CUDA_SAFE_CALL(cuCtxCreate(&context, 0, cuDevice));
CUDA_SAFE_CALL(cuModuleLoadDataEx(&module, ptx, 0, 0, 0));

CUdeviceptr dResult;
int hResult = 0;
CUDA_SAFE_CALL(cuMemAlloc(&dResult, sizeof(hResult)));
CUDA_SAFE_CALL(cuMemcpyHtoD(dResult, &hResult, sizeof(hResult)));

// for each of the name expressions previously provided to NVRTCP
// extract the lowered name for corresponding __global__ function,
// and launch it.
for (size_t i = 0; i < name_vec.size(); ++i) {
    const char *name;

    // note: this call must be made after NVRTCP program has been
    // compiled and before it has been destroyed.
    NVRTC_SAFE_CALL(nvrtcGetLoweredName(
        prog,
        name_vec[i].c_str(), // name expression
        &name                // lowered name
    ));

    // get pointer to kernel from loaded PTX
    CUfunction kernel;
    CUDA_SAFE_CALL(cuModuleGetFunction(&kernel, module, name));

    // launch the kernel
    std::cout << "launching " << name << " (" << name_vec[i] << ")
               " << std::endl;

    void *args[] = { &dResult };
    CUDA_SAFE_CALL(
        cuLaunchKernel(kernel,
        1, 1, 1,             // grid dim
        1, 1, 1,             // block dim
        0, NULL,             // shared mem and stream
        args, 0));           // arguments
    CUDA_SAFE_CALL(cuCtxSynchronize());

    // Retrieve the result
    CUDA_SAFE_CALL(cuMemcpyDtoH(&hResult, dResult, sizeof(hResult)));

    // check against expected value
    if (expected_result[i] != hResult) {
        std::cout << "\nError: expected result = " << expected_result[i] << " , actual result = " << hResult << std::endl;
        exit(1);
    }
}

// Release resources.
CUDA_SAFE_CALL(cuMemFree(dResult));
CUDA_SAFE_CALL(cuModuleUnload(module));
CUDA_SAFE_CALL(cuCtxDestroy(context));

// Destroy the program.
NVRTC_SAFE_CALL(nvrtcDestroyProgram(&prog));

return 0;
C.2. Build Instruction

Assuming the environment variable `CUDA_PATH` points to CUDA Toolkit installation directory, build this example as:

- **Windows:**
  ```
  cl.exe -DNVRTC_GET_TYPE_NAME=1 host-type-name.cpp /Fehost-type-name /I "%CUDA_PATH%\include ^

D.2. Build Instruction

Assuming the environment variable CUDA_PATH points to CUDA Toolkit installation directory, build this example as:

- Windows:
  ```
  cl.exe dynamic-parallelism.cpp /Fedynamic-parallelism ^
  /I "%CUDA_PATH%\include" ^
  "%CUDA_PATH%\lib\x64\nvrtc.lib "%CUDA_PATH%\lib\x64\cuda.lib
  ```

- Linux:
  ```
  g++ dynamic-parallelism.cpp -o dynamic-parallelism \
  -I $CUDA_PATH/include \ 
  -L $CUDA_PATH/lib64 \ 
  -lnvrtc =lcuda \ 
  -Wl,-rpath,$CUDA_PATH/lib64
  ```

- Mac OS X:
  ```
  clang++ dynamic-parallelism.cpp -o dynamic-parallelism \
  -I $CUDA_PATH/include \ 
  -L $CUDA_PATH/lib \ 
  -lnvrtc =framework CUDA \ 
  -Wl,-rpath,$CUDA_PATH/lib
  ```
Notice

ALL NVIDIA DESIGN SPECIFICATIONS, REFERENCE BOARDS, FILES, DRAWINGS, DIAGNOSTICS, LISTS, AND OTHER DOCUMENTS (TOGETHER AND SEPARATELY, "MATERIALS") ARE BEING PROVIDED "AS IS." NVIDIA MAKES NO WARRANTIES, EXPRESSED, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE MATERIALS, AND EXPRESSLY DISCLAIMS ALL IMPLIED WARRANTIES OF NONINFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE.

Information furnished is believed to be accurate and reliable. However, NVIDIA Corporation assumes no responsibility for the consequences of use of such information or for any infringement of patents or other rights of third parties that may result from its use. No license is granted by implication of otherwise under any patent rights of NVIDIA Corporation. Specifications mentioned in this publication are subject to change without notice. This publication supersedes and replaces all other information previously supplied. NVIDIA Corporation products are not authorized as critical components in life support devices or systems without express written approval of NVIDIA Corporation.

Trademarks

NVIDIA and the NVIDIA logo are trademarks or registered trademarks of NVIDIA Corporation in the U.S. and other countries. Other company and product names may be trademarks of the respective companies with which they are associated.
